Warwick was next in England on June 27, 1460, when he landed at Sandwich. In four days he was before the walls of London, having marched in that time a distance of 70 miles. In the beginning of July the battle of Northampton was fought. The Yorkists gained a complete victory, and took Henry prisoner. Before the fight Warwick issued the command to spare the common people but to slay the nobles, judging the quarrel to be more especially theirs, and it is significant that throughout the Wars of the Roses the proportion of leaders slain far exceeds that in any other war. Up to this time Warwick's conception of the war was merely the natural struggle of the one party with the other for power, using as their means the rude arguments of the time. He still maintained his loyalty to King Henry, and when the Duke of York after the battle of Northampton presented his claim to the throne Warwick opposed him, and prevailed upon him to waive it till the death of the king. But naturally such a state of things could not long endure. Warwick, while respecting the person of the king, was fighting against his orders, and so, while professing loyalty, was actually a rebel. Soon the struggle blazed out anew, and in December 1460 the Duke of York was defeated and slain at Wakefield. Early in 1461 Warwick was defeated in the second battle of St Albans, but the royalists not taking advantage of their victory, Edward, son of the Duke of York, accompanied by Warwick, marched on London, and was proclaimed king as Edward IV. Soon after the Yorkists gained a complete victory at Towton (1461), the bloodiest field of the whole war. Nearly all the Lancastrian chiefs were slain, Henry's cause was lost, and ere long he was captured by Warwick and lodged in the Tower. The credit of the crowning victory of Towton does not rest with Warwick alone, for he had the help of young Edward, a greater military genius than himself. Little is known of the details of the fighting, but we are told that wherever the Earl of Warwick was there the fight raged hottest. But now, when Warwick might have expected to reap the reward of his labours, new troubles arose. King Edward began to feel jealous of his power, his unique influence, and vast popularity. Warwick was sent to France to arrange a treaty with Louis, and to propose a marriage between Edward and his wife's sister. On his return he found the king married to Elizabeth Woodville, daughter of Lord Rivers, and an alliance made with the enemy of Louis, the Duke of Burgundy. Edward now lavished all his kindness on the Woodvilles, intending to use them as a counterfoil to the Nevilles, and for this purpose he deprived the Nevilles of some of their posts. By a series of deliberate insults Warwick was driven further and further away from the king, till he was forced into open revolt. Louis XI. used his influence in bringing Warwick and Margaret together, and they agreed to forget their differences in the face of a common enemy. Clarence, the king's brother, joined their party and married Warwick's daughter. Edward fled to Holland, and the king-maker placed Henry once more upon the throne. But ere long Edward secretly landed in England, raised an army not without difficulty, and met Warwick at Barnet. The faithless Clarence had in the meantime deserted Warwick and joined his brother's army. The army of Warwick was composed of strangely different elements—old enemies fighting side by side as friends. The battle was lost mainly through a grievous blunder. In the heavy mist which hung around the party of the Earl of Oxford was mistaken for the enemy and was attacked by their own friends. The cry of treachery was raised, and the whole army broke into utter rout. Warwick

resisted till all hope was gone. He had fought on foot throughout the battle, and his heavy armour did not suffer him to escape. He was surrounded and slain, fighting manfully, April 14, 1471.

Thus fell on the field of battle Richard, Earl of Warwick, in the prime of his life, after sixteen years of deep intrigue and desperate fighting. Had he been born in a more peaceful time he would have been a great statesman, and have done much for the good of his country, for his talents were more political than military, and almost alone amongst the self-seeking rivals of the time he shows something of the instincts of patriotism. Cast as he was in the troublous times of the Wars of the Roses, he stands out in character and genius above all those of his generation. He was the best beloved man in the kingdom. When he was away from England, says Hall, the common people thought the sun had gone out of the heavens. His personality cast a charm over even Louis XI. The heart of the Yorkist party, he was true to its cause till he found that his service was no longer desired. He was not the man to sit quietly under insult, and when it came from King Edward, who owed all that he was to him, it was more than he could endure. Yet it was only when he found his every project thwarted, and especially those that were dearest to his heart, that he was driven into open warfare with the king. His treason is capable of much justification: he cannot be accused of forsaking his master. He had in him the making of a great king, and how great and useful might have been his career had fortune placed him over the councils of a Charles VII. or a Henry VI.! As it is, he stands in worth and character far above any of his time, a figure that commands not merely admiration but affection.

Lytton's *Last of the Barons* is but poor stuff as romance, and is not to be taken seriously as history. See Polydore Virgil, Waurin, and Hall; and of modern books, J. Gairdner, *The Houses of Lancaster and York* in 'Epochs of History' (1874), C. W. Oman's study in 'English Men of Action' (1891), and Sir James Ramsay's *Houses of Lancaster and York* (1892); also PERCY.

Warwickshire, a west midland county of England, bounded by the counties of Stafford, Derby, Leicester, Northampton, Oxford, Gloucester, and Worcester. It has an extreme length from north to south of 52 miles, an extreme breadth of 33 miles, and an area of 881 sq. m., or 563,946 acres. In the south are spurs of the Coteswolds, as the Edge Hills (826 feet); but elsewhere the surface is varied only by gentle undulations, formerly covered by the Forest of Arden. The Avon, flowing from north-east to south-west towards the Severn, is the principal river; but in the north is the Tame, a tributary of the Trent. New red sandstone is the chief formation, with lias to the south; and a coalfield, 16 miles by 3, extends from near Coventry to the Staffordshire boundary east of Tamworth. The output of coal in 1890 was 1,744,174 tons; and Warwickshire also produces some fireclay, ironstone, limestone, &c. About seven-eighths of the total area is in crops and permanent pasture; woods and plantations occupy nearly 21,000 acres. The great industries are noticed under Birmingham and Coventry; other towns are Warwick, Rugby, Leamington, Stratford-on-Avon, and Nuneaton. The county, which comprises four hundreds and 256 parishes with parts of seven others, is mainly in the diocese of Worcester. For parliamentary purposes it is divided into four divisions, each returning one member—the north or Tamworth, north-east or Nuneaton, south-west or Stratford-on Avon, and south-east or Rugby. The county councillors number seventy-two. The antiquities include a stone circle (the 'Rollright Stones'), Roman stations and roads, and a wealth of mediæval remains, as Warwick and Kenilworth castles. The battlefield of Edgehill must also be noticed; whilst of Warwickshire worthies may be mentioned Shakespeare, Baskerville, Samuel Butler, David Cox, Drayton, Dugdale, 'George Eliot,' Landor, Dr Parr, and Priestley. Pop. (1801) 206,798; (1841) 401,703; (1881) 737,339; (1891) 805,070.

See Dugdale's *Antiquities of Warwickshire* (1656; new ed. by W. Thomas, 2 vols. 1730), and later histories by W. Smith (1830), W. West (1830), J. T. Burgess (1876), S. Timmins (1889), and Burgess (1893).

Wash, a wide estuary on the east coast of England, between the counties of Lincoln and Norfolk, is 22 miles in length and 15 in average breadth. It is surrounded by low and marshy shores, and receives the rivers Witham, Welland, Ouse, Nen, and Nar. The estuary for the most part is occupied by sandbanks, dry at low-water, and between these sandbanks are the channels through which those rivers flow into the North Sea. On both sides of the channel by which the Ouse falls into the sea considerable tracts of land have been reclaimed. Anchorage is afforded to vessels by two wide spaces or pools of water, called respectively Lynn Deeps, opposite the Norfolk, and Boston Deeps, off the Lincoln coast.

Washing-machines. There are many kinds of domestic washing-machines. One of the simplest is the dolly, a wooden disc with three or more projecting arms placed horizontally on an upright shaft in a tub. The shaft is fixed in a step at the bottom and passes through a cross piece at the top, and is turned either by a cross handle or by simple spur gear. The arms are moved round backwards and forwards amongst the clothes. Nearly all domestic washing-machines consist of a tub or cistern of a form which suits the nature of the moving parts of the apparatus. Some operate by squeezing the clothes between grooved rollers, others by rubbing them between corrugated surfaces by a rocking or up and down motion, others again have a combined squeezing and rubbing action, while some are made on the principle of the old dash-wheel used in bleaching and dye works. Some recent washing-machines, which have been a good deal used, consist of a ribbed drum or cage formed of tubes fixed into the ends of the drum. The clothes are placed inside the cage, which is kept revolving in opposite ways by turns inside a thin metal case, the hot soapy water circulating freely between the tubes. See Frater's patent specification, No. 11,116, 15th September 1885. Machines of this kind can be heated with a Bunsen burner. One of the newest forms of washing-machine is on the principle of Carr's disintegrator. Many illustrations of washing-machines will be found in *The Illustrated Official Journal of Abridgments of Patents* issued by the Patent Office, and some improved forms of large washing and scouring machines used in factories are illustrated in recent volumes of *The Textile Manufacturer*. See also the article BLEACHING.

Washington, the most north-western state of the American Union, lies south of British Columbia, is bounded by Idaho on the E., Oregon on the S., and borders upon the Pacific Ocean on the W. From east to west it measures about 350 miles, and its width from north to south is about 200 miles. Its area is 69,180 sq. m., of which the water-surface occupies 2300 sq. m. It ranks eighteenth in area and thirty-fourth in population of all the states and territories.

Copyright 1892 in U.S. by J. B. Lippincott Company.

The Cascade Range (q.v.) traverses the state from north to south, forming a natural topographical division. For convenience the region between

the Cascades and the Columbia River is described as Central Washington, and the portion east of the river as Eastern Washington. The summits of several of the volcanic cones are covered with perpetual snow, and the glaciers which fill their upper slopes rival in beauty the Alpine ice-rivers of Switzerland. Western Washington, which comprises about one-third of the state, is a mountainous region interspersed with numerous fertile valleys. The Coast Range to the west of the Cascades extends in broken and disorderly masses from the southern border of the state along the Pacific coast to Cape Flattery at the entrance to the Strait of Juan de Fuca. The mountains of this range increase in height toward the north, where they are known as the Olympic Mountains. Mount Olympus, the loftiest summit, is 8138 feet high. The coast is abrupt, except at Shoalwater Bay and Gray's Harbour, and many short and rapid streams flow down the western slopes directly into the ocean. The tide-water basin at the mouth of the Columbia River and the Chehalis valley, farther north, are the most important indentations of the coast south of the Strait of Juan de Fuca. This body of water, together with the extensive inland sea known as Puget Sound, affords some of the best harbours in the world, and is of great commercial importance. Puget Sound has a coast-line of more than 1000 miles, and receives the waters of numerous rivers. Central Washington is a lofty plateau region, its surface, like that of Eastern Washington, largely covered with lava and other volcanic products. It is traversed by spurs of the Cascade Mountains, and exhibits many abrupt changes of elevation. The Yakima River and other tributaries of the Columbia have carved deep valleys in the plateau. The streams are broken by falls and rapids, presenting a succession of varied and picturesque scenery. East of the Columbia the plateaus and plains are cut by the valleys of Clark's Fork and the Spokane and Snake rivers. In the north-east the surface is diversified by spurs of the Pend d'Oreille Mountains, and in the south-east the highest elevations belong to the Blue Mountains, which extend into the state from Oregon. The whole of the eastern part of the state and a portion of the region west of the Cascades are drained by the Columbia River, which for a distance of nearly 300 miles forms the boundary between this state and Oregon. In Western Washington, especially in the vicinity of Puget Sound, the winters are very mild. The rainfall is heavier than in any other portion of the United States. East of the Cascades the winters are colder and the rainfall lighter. The warm ocean current which bathes its western shores gives, however, to the whole state a climate much milder than that prevailing in sections to the east which have the same latitude. Lumbering is one of the leading pursuits. Western Washington is heavily wooded. Many of the trees are of enormous size, and in the density of their growth some of the forests are scarcely surpassed by those of the tropics. The soil is exceedingly fertile in many sections of the state. Portions of Central and Eastern Washington are well adapted for wheat-growing and grazing. There are extensive coalfields around Puget Sound, and coal-mining is an important industry. The fisheries along the coast, and the salmon-canneries on the Columbia River, are of considerable value.

Washington was first organised as a territory in 1853, with an area much greater than that of the present state. It was reduced to its present limits in 1863, and was admitted to the Union as a state in 1889. The state has thirty-six counties. Olympia, the capital, is situated at the head of Puget Sound. Seattle and Tacoma farther north on the eastern shore of Puget Sound, and Spokane Falls on the Spokane River, are the largest towns. Other places of importance are Walla Walla, Port Townsend, and Fairhaven. Pop. (1870) 23,955; (1880) 75,116; (1890) 349,390; (1900) 517,674.

Washington is the name of over 200 cities, towns, townships, villages, and hamlets in the United States, of which the largest, after the federal capital, are (1) the capital of Daviess county, Indiana, 173 miles by rail W. of Cincinnati, with coal-mines near by, and a pop. of 6064; (2) the capital of Fayette county, Ohio, 77 miles by rail ENE. of Cincinnati, with a pop. of 5742: and (3) the capital of Washington county, Pennsylvania, 31 miles by rail SW. of Pittsburgh, with many mills and cigar-factories, coal-mines, and exports of wool, and containing the Washington and Jefferson College (Presbyterian; founded 1802). Pop. 7063.

Washington, Rules of. See Neutrality.

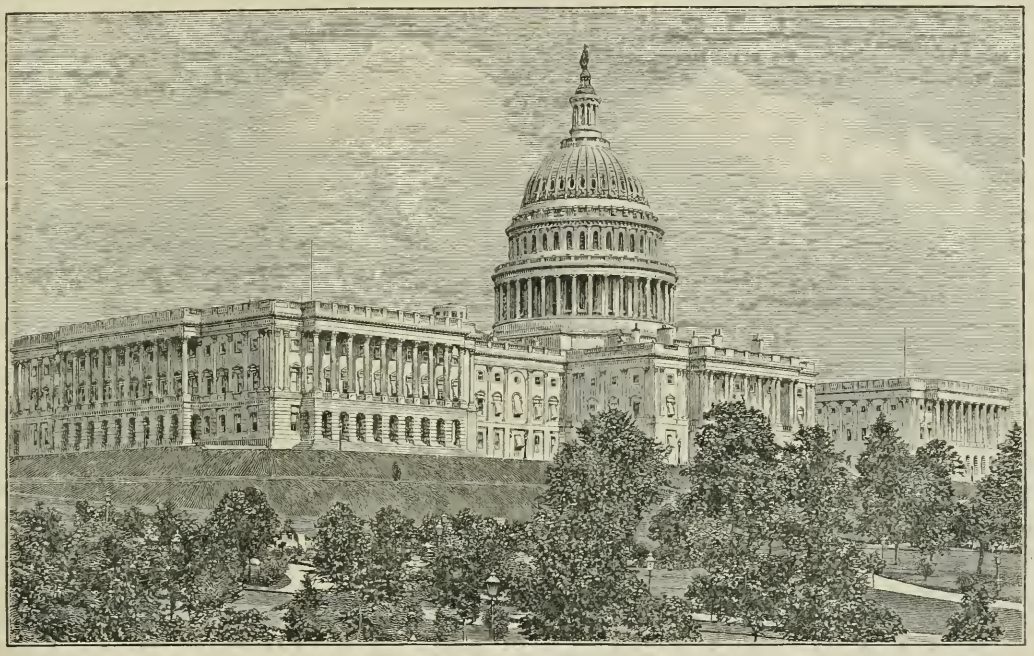
Washington City, the capital of the United States, is situated in the District of Columbia (q.v.), on the Potomac River, in 38° 53′ lat., 77° 2′ long., distant 226 miles S. from New York, 136 from Philadelphia, and 40 from Baltimore. The city covers an area of about 10 sq. m., or, with its suburbs of Georgetown (now West Washington) and the country portion of the district, 70 sq. m. Out of the 6111 acres covered by the city proper the streets and avenues occupy 2554 acres, and the government reservations (parks, &c.) 541 acres, thus leaving more than half its area permanently free from the encroachment of buildings. Besides the numerous small parks, Washington has a zoological park of 140 acres, and the Rock Creek Park of over 1500 acres, purchased in 1892 for $1,200,000, and extending for miles along the picturesque banks of a stream, amid forests of great natural beauty. There are 170 miles of paved streets and avenues, and 65 miles of unimproved streets. The improved streets are chiefly paved with asphalt, and all are thickly planted with shade-trees, numbering over 85,000, of many varieties, maples predominating.

Copyright 1892 in U.S. by J. B. Lippincott Company.

The architecture of the city in the older settled districts is cheap and commonplace, but in the newer Washington is of striking variety and attractiveness. The government buildings are mostly fine and imposing structures. The Capitol, in which the national congress meets and the supreme court holds its sittings, is conspicuously placed on an eminence, commanding a noble view. Its lofty iron dome, crowned by a bronze figure of Liberty, is 285 feet in height, its length 751 feet, and its total cost about $14,000,000, including repairs. The central rotunda contains some elaborate frescoes, and historical paintings by Trumbull (q.v.) and other artists. The hall of the House of Representatives is a spacious apartment, with desks for 356 members, and seats in the galleries for 1500 spectators. The Senate Chamber, with eighty-eight senators, accommodates 1000 spectators. The National Memorial Hall in the Capitol is to receive statues contributed by each state to commemorate two of its distinguished citizens. The Treasury Department at Pennsylvania Avenue and Fifteenth Street, built of freestone and granite in the Ionic style, cost $7,000,000. The Interior Department, in which is located the Patent Office, occupies an entire square in the heart of the city, and is constructed of white marble, in pure Doric, costing $3,000,000. The Post-office Department opposite is a fine marble edifice of the Corinthian order of architecture. The granite building erected for the departments of state, war, and navy, in Renaissance style, is the largest

public edifice in Washington, covers 4½ acres, has 566 rooms, and cost $11,000,000. The new Congressional Library building, on Capitol Hill, is built of solid white granite, in Italian Renaissance style, with iron, marble, and brick interior, and will cost $6,000,000. The president's house, and executive mansion, is a plain edifice of freestone, in classic style, painted white (whence called 'the White House'). The other public buildings embrace the Agricultural Department, the Department of Justice, the Pension Office, the National Museum, the Bureau of Engraving and Printing, the Army Medical Museum, the Coast Survey buildings, and the Smithsonian Institution. All of these are of brick, except the last, which is built of red sandstone, in the Byzantine style, with picturesque towers. The national monument to Washington is a towering obelisk of white marble, 555 feet in height, on the bank of the Potomac, erected at a cost of $1,230,000. The United States Naval Observatory, also of white marble, occupies a retired and commanding site on Georgetown Heights.

The National Soldiers' Home, 2 miles above the city, founded in 1851, has 600 acres of improved park and forest, and serves as a free driving park and attractive rural resort, besides its primary function of providing a comfortable home for old and invalid soldiers of the United States army. The National Asylum for the Insane, on the heights above the Anacostia, or eastern branch of the Potomac, has nearly 1000 inmates, who must be either of the army or navy, or residents of the



The Capitol, Washington.

District of Columbia. There are five hospitals, five orphan asylums, a foundling hospital, and several homes for the aged, for widows, and for the indigent. Washington is rich in institutions of learning, and its free public museums, libraries, and art galleries afford invaluable aids to those pursuing academical or professional studies. The Columbian University, founded in 1814, Georgetown College (Roman Catholic), dating from 1789, the National University, and Howard University (for coloured students) have each departments of law and medicine, besides the regular college course. The Catholic University of America, established in 1887, has two fine stone buildings just outside the city limits, the Divinity College being fully organised, and the Hall of Philosophy soon to be opened. The American University, under charge of the Methodists, has its grounds above Georgetown, and is expected to raise $10,000,000 for buildings and endowment. The National Deaf-Mute College, founded in 1864, is a government institution for the education of deaf and dumb pupils from the army, the navy, and the District of Columbia. Its fine stone buildings lie just north of the city. Gonzaga College (Catholic) is on I Street. There are three business colleges, several seminaries for young ladies, five classical schools, schools of languages, elocution, &c., and a large number of private schools. The public school system is in a high state of efficiency, 35,764 pupils being enrolled in the common schools out of a school census of 52,590. There are 97 public school houses, with 680 teachers, and annual expenditure of about $950,000. The Smithsonian Institution (q.v.), founded in 1846, affords valuable advantages to all institutions of learning, in the United States and abroad, through its system of international exchanges and by its numerous publications of the fruits of original research in many departments of science. The National Museum, originally established to exhibit the rich contributions given to the government by various countries from the World's Fair at Philadelphia in 1876, has become a most extensive and instructive collection of antiquities, ethnology, geology, and natural history generally.

Of bronze statues erected in honour of famous men Washington has an abundance—mainly to military characters. Already hardly a public square or circle is without its monument. Equestrian statues of Washington, Jackson, Greene, Scott, Thomas, and McPherson are erected, besides full-length statues of Lafayette, Luther, Franklin, Chief-justice Marshall, Lincoln, Garfield, Professor

Henry, Farragut, General Rawlins, and Admiral Dupont. Washington has no less than 182 churches. The city is abundantly supplied with pure water, by a conduit 15 miles long, from the Great Falls of the Potomac.

While Washington has few manufactures, no foreign commerce, and but little shipping (being dependent on Georgetown for its small harbour facilities), it has a distinction, as the seat of the general government, to which no other city in the Union can lay claim. The annual assemblage of congress attracts a large influx of visitors from all parts of the country, while the great and far-reaching business of all departments of the government requires a small army of officers and clerks for its transaction. The various bureaus employ between 6000 and 7000 persons. The city is to a great degree populated by the official class, and by merchants, artificers, and small manufacturers who supply their wants. The number of hotels and boarding-houses is very great. A steadily increasing number of people of wealth and taste are building residences at the national capital, where the presence of the diplomatic corps and of travellers and sojourners from all parts of the globe renders the society in a large sense cosmopolitan. The absence of smoky manufactories, the genial and salubrious climate, the pleasant situation and attractive suburbs, with the wide and smooth streets, contribute to render a residence in Washington during most of the year agreeable. The summer brings torrid heats, as in most cities and large towns, though not always long continued. The average temperature of the winter is 36°, spring 55°, summer 76°, and autumn 56°; for the whole year the mean is 56° F.

The government of the Federal city (as President Washington called it, until the commissioners gave it his name in 1791) has been since 1874 vested in a commission of three officers, appointed by the president and senate. They have charge of all municipal and administrative affairs, police, street-improvements, schools, &c., while congress is the sole legislature of the city and district, the citizens having no suffrage. As the government owns nearly half the property in the district, and the city exists largely for the benefit of its officers—legislative, executive, and judicial—it has been settled by act of congress that the government pays half the annual expenses of the city government, the other moiety being taxed upon the property of the citizens. This government by commission has on the whole worked well in practice. The final location of the national capital at Washington, to which it was removed from Philadelphia in 1800, was the fruit of a compromise, after a long struggle between the advocates of various cities in congress. The votes of those who favoured a wholly new settlement for that body, to avoid what were feared as local and sectional influences of the great cities, joined to the advocates of assumption of the state debts by the nation, carried the day for a location in what was then a wilderness. Various attempts were made, owing to the early discomforts of the capital, to change the seat of government. These were renewed in 1814, after the burning of the Capitol by the British army, and in 1846, on occasion of the ceding back to Virginia of her share of the District of Columbia. But the steady growth of the city and the public buildings, with the difficulty of agreeing upon any new or more central site, finally put to rest the agitation for removal. After the civil war of 1861–65 Washington began to move forward in a new career of prosperity. Its unpaved and unsightly streets were taken in hand, its defective sewerage system was radically reformed, its steep grades were reduced, thousands of shade-trees were planted, and the town was transformed in a few years from a neglected and repulsive place to a beautiful and attractive city.

The original plan of Washington City was made by L'Enfant, a French engineer who had adopted America as his residence. Based largely upon the topography of Versailles, its characteristic features are the crossing of the rectangular streets by frequent broad transverse avenues, 160 to 120 feet wide, and the numerous circles and triangular reservations interspersed as little parks throughout the city. With a foresight of the future greatness of the country which now seems marvellous, the whole city was laid out on a scale so ample, with such wide spaces between its public buildings, as to lead to much cheap ridicule of Washington as 'the city of magnificent distances.' These distances, however, are now found not a whit too great, when the comfort and health of a teeming population are to be provided for. The population of Washington in 1800 was 3210; 1830, 23,364; 1860, 61,122; 1880, 147,293; 1890, 230,392.

Washington, GEORGE, was born February 22 (New Style), 1732, at Bridges Creek, Westmoreland county, Virginia. He died, without issue, December 14, 1799, at Mount Vernon on the Potomac.

Copyright 1892 in U.S. by J. B. Lippincott Company.

He came of good English stock, being descended from the Washingtons of Northamptonshire. At an earlier time the family seems to have lived in the more northern part of England, and we cannot be far out of the way in tracing his origin to the mingled Norse and Angle blood of Yorkshire. In 1658 George Washington's grandfather, John Washington, first appeared in Virginia, and soon acquired wealth and position. He commanded the Virginia militia in the disgraceful attack on the Indians in Piscataway Fort, Maryland. For his share in this enterprise he was reprimanded by Governor Berkeley. The people, however, seem to have been on his side. He died soon after, and took no part in Bacon's rebellion against Berkeley (1676). John Washington's second son, Augustine, was the father of George Washington, by his second wife Mary Ball. Augustine died while George was still a mere boy, leaving a large family, and means inadequate to the upbringing of the younger children.

Nothing is known of Washington's childhood, notwithstanding the many stories which have gathered about his name. He seems to have been a good, healthy boy of strong physique, with a sober-mindedness somewhat beyond his years. In 1747 he went to Mount Vernon, the residence of his half-brother Lawrence, who, as the eldest son of Augustine Washington, had received the better part of the Washington property, and an English education. The removal was a good thing for the boy, as it gave him access to books and to better teachers, and brought him into contact with the Fairfax family, to which Lawrence Washington's wife belonged. His love of hunting seems to have been the thing that attracted Lord Fairfax to him. At all events, in 1748, when Washington was sixteen years of age, Lord Fairfax employed him to survey the property in the Valley of Virginia which he had inherited from the avaricious Lord Culpeper of Charles II.'s time. Surveying alternated with hunting, and the winters were passed at Mount Vernon. Still Washington acquired from these expeditions habits of self-reliance and endurance which such a life alone teaches. In 1751 he accompanied his brother, who was dying of consumption, to the Barbadoes; and this seems to have been the only time he went beyond the limits of the continental colonies. In 1752 Lawrence Washington died, leaving him guardian of his only daughter, and heir to his estates in the event of

that daughter's death without issue. Lawrence Washington had seen some service with Admiral Vernon, and, either because he noticed warlike ability in his younger brother or for some other reason, determined to give him a military training. He therefore invited two of his old comrades in war to Mount Vernon, and there in the intervals of surveying and hunting Washington was taught the manual of arms and the elements of the art of war.

The French at this time (1752) were connecting their settlements on the Great Lakes with those on the Mississippi by a chain of posts on the Ohio. This region was regarded as within the sphere of English influence—to apply a phrase of the day to the earlier time. Governor Dinwiddie of Virginia determined to warn the intruders off. He sent one messenger who returned frightened before half the distance had been accomplished. Looking about for a more efficient messenger, his attention was called, perhaps by Lord Fairfax, to young Washington, and he was sent. This time there was no turning back, and the task was performed in the same relentlessly thorough way so characteristic of his later doings. There has come down to us a journal describing this trip, and it is one of the pleasantest bits of writing from Washington's pen. The French, however, paid no attention whatever to his warning. Dinwiddie determined to drive them off by force, and an expedition was sent against them of which Washington was nominally second in command. In reality, owing to the death of his superior, he was in command during the important part of the campaign. The event was unfortunate. Washington was driven back, surrounded, shut up in a little fort commanded by higher ground, and forced to surrender. But he had learned a valuable lesson in military science. It was at this time that an order was issued from the headquarters of the English army to the effect that any field-officer holding a royal commission could command a colonial officer, no matter what the respective ranks of the two men might be. Washington, notwithstanding his love of war, at once resigned. He was induced, however, to serve on Braddock's personal staff, a position which made him independent of the regular officers. In this capacity he gave a great deal of good advice, which was disregarded, and saved the remnant of the van of Braddock's army. He was then placed at the head of the Virginia forces, and in 1756 visited Boston to see General Shirley, the English commander-in-chief, and settle the matter of rank. This was arranged to Washington's satisfaction, and he continued in the service. This journey to Boston and back made Washington's face and figure known to many persons in the Middle and New England colonies, and undoubtedly contributed in no small degree to his selection as commander-in-chief in 1775. For the remainder of the war he did what he could, giving advice to English generals—which was seldom followed—and extorting money and supplies from a reluctant legislature. But barren of tangible results as these years were, they were nevertheless the most important in that formative process which made him the patient, tenacious, clear-headed man of the revolution. This struggling was a mere foretaste of what was coming to him.

The years from the close of the Seven Years' War (1763) to the meeting of the Continental Congress in 1774 are the most attractive in Washington's life. He seems to have had more than his share of love affairs, but none led to marriage, until in 1758 he fell in love with a rich young widow, Martha Custis (1732–1802). The wooing was short, and the marriage was celebrated in 1759. His niece was now dead, and the combined estates of Mount Vernon and of the widow Custis made him one of the richest men in the land. He kept open house, entertained liberally, led the hunting, and produced honest grain and tobacco. Virginia life in those times was rude and boisterous. Yet one likes to look back on it and see the young Virginia colonel leading the life of his day, such as it was. He represented his county in the House of Burgesses, and acted as vestryman of his parish. From this peaceful life, however, he was once more to emerge and place himself at the head of the resistance to England.

Familiar with war, Washington wished to try all peaceful measures first, and was thus one of the leaders in the anti-importation movements. But as time went on he became slowly convinced that nothing save force would secure to his countrymen their rights. The question at issue was really the same as the dispute about military precedence. Washington, regarding himself and his countrymen as the equals of any subjects of George III., believed in self-government for America, and prepared to oppose coercion by force.

He represented Virginia in the First and Second Continental Congresses, and at once took a leading part. He was no orator like Patrick Henry, nor writer like Thomas Jefferson. But in rude common sense and in the management of affairs he excelled them all. More than this, however, he was the one American soldier of national reputation, and when congress organised the national resistance he was necessarily appointed commander-in-chief. He possessed remarkable powers as a strategist and tactician, but it was as a leader of men that Washington stood forth pre-eminent. There seems to have been something in his bearing and presence to inspire confidence. He also possessed the happy faculty of always rising to the dignity of the occasion, while never going beyond what the occasion demanded. It was this composed, well-dressed gentleman who took command of the New England farmers and mechanics assembled at Cambridge in the summer of 1775. At first he did not understand them, nor they him, but before long he brought order out of confusion, and at the same time won the love and respect of his men. It seems scarcely credible that these half-disciplined, half-armed men should have held cooped up in Boston a comparatively large, thoroughly-disciplined and well-equipped army, and still more incredible that they should have compelled its final departure. Of course the retreat from Concord and the slaughter at Bunker Hill had much to do with it. But these disasters were themselves due to the incompetence of the English commander. Indeed Washington's fame as a military man was dimmed by the incompetency of his opponents. The only really able commander opposed to him was Cornwallis, and he was hampered in the campaigns where they were opposed by the stupidity of his immediate superior. Whether a strong, able man could have brushed aside the besiegers of Boston may perhaps be doubtful. But it can hardly be maintained that such a man would have allowed Washington to save his army in the autumn of 1776, and certainly he would have made such a crushing campaign as that of Trenton impossible. It is a part of the art of war to judge one's opponents correctly, and Washington, judging his opponents correctly, undertook movements which, under other circumstances, should have cost him his army. In fact it may be said that his battle was not with the enemy, but with his friends. His army was always crumbling to pieces owing to short enlistments, and the very necessaries of life were sometimes unattainable. But through it all Washington appears, except on the rare occasions when he lost control of his temper, the same silent, composed, well-dressed gentleman.

The end of the war came, and with it the temptation which comes to successful commanders in civil wars. The army wished to make him ruler of the country—partly through respect for him, partly to secure the pensions and lands which had been promised them by congress. On his side Washington wished to lead his countrymen into orderly government out of the confusion and chaos in which they were then involved. The easy way to the accomplishment of this purpose would have been to make himself the lawgiver. He might even have founded a dynasty. But Washington never for one moment faltered. He had fought the great war to secure the rights of his fellow-countrymen, not for his own aggrandisement. Singularly enough there are persons who almost blame Washington for preferring his country's good to his own greatness.

Washington retired to Mount Vernon and turned his attention to securing a stronger government by constitutional means. Society seemed almost falling to pieces. By 1787 matters had reached such a pass that even congress moved, and a convention of delegates from twelve states met at Philadelphia and formulated the present constitution of the United States. Over the deliberations of this convention Washington presided. The government under this constitution began in 1789 with Washington as first chief-magistrate or president.

To his new office he brought the same qualities which had contributed so much to the success of the revolution—the same honesty of purpose and dignity of character. As soon as it was fairly started, the people saw that the new government was entirely unlike the old. It was a strong consolidated government, as the enemies of the constitution declared it would be. Parties were formed, led by Washington's two most trusted advisers, Jefferson and Hamilton. Washington's position with regard to these early parties has been a subject of dispute ever since his death. One set of biographers represent him as standing apart and above faction, as striving to moderate the asperities of political life. They point to the fact that Jefferson, a known opponent of the constitution, was called to the highest position in the cabinet, and assert that upon his retirement the place was offered to Patrick Henry, who had opposed the ratification of the constitution more strenuously than any other man. Another set of biographers represent him as a party man and leader of the Federalist or strong government party. They assert that at the time of his appointment Washington was not aware of Jefferson's opposition to the constitution. They furthermore deny that the secretaryship of state was ever offered to Henry, and point to the fact that Washington called himself a Federalist in a letter written in 1799. Probably there is truth in both views. At the outset it seems that Washington was desirous of enlisting on the side of the new government the ablest men in the country, whether they had approved or disapproved the precise form of the constitution. As time went on, however, it became evident that those desiring greater liberty for the individual would no longer be content with passive opposition. A strong party, almost at once, sprang into life, and began a campaign which has never been surpassed for personal abuse and virulence. Stung by their taunts, Washington lost his faith in American institutions, and went over heart and soul to the Federalist party. He declared in one letter that he had been attacked in such 'indecent terms as could scarcely be applied to a Nero, a notorious defaulter, or even to a common pickpocket.' In another letter he proposed that none but persons of 'sound politics' should be appointed to high offices in the army, and was doubtful of the advisability of admitting members of the opposition or Republican party to the army at all—thus proscribing about half the male population of the country as persons who could not be trusted. Fortunately the election which occurred soon after these letters were written turned the government over to the care of Jefferson and the party which abetted 'the nefarious views of another nation upon our rights,' to use Washington's own words. He did not live to see how wholly in the wrong he was, as he died a few months after these sentences were written.

At the outset it seemed desirable to surround the new government with ceremony and show. Washington therefore was accustomed to open congress in person, driving there in a cream-coloured coach drawn by four or six white horses, with servants in livery. He made a speech to the assembled legislators, and they, in return, addressed him—all being apparently modelled on the English customs. Then, too, his receptions were more formal, if possible, than those of royalty itself. Washington held his hand behind his back, and bowed civilly to those who were presented to him. All this savoured of monarchy, and the opposition, seeing their chance, charged that Hamilton and the Federalists intended to introduce monarchy. There is no reason to suppose the charge true—although Hamilton no doubt preferred a monarchical form of government. But the people believed it to be true.

In great contrast to this violence on either side was Washington's farewell address, advising his countrymen above all to 'be Americans.' In fact, of all the many striking things in Washington's life and work his Americanism stands forth. At a time when those about him were provincials he was an American. He thought America should stand aloof from the conflicts of Europe, and inaugurated a policy of neutrality which has remained the policy of the country from his time to ours.

Washington's early education was poor, and he began his life-work at the age when most boys are entering upon a college career. This deficiency in his training was more patent to him perhaps than to any other person. To the very last he was engaged in remedying this defect, and died a fairly well read man in history and politics. He knew no language but his own, but he was familiar with the masterpieces of the English tongue.

For a list of Washington's writings, see Winsor, *Narrative and Critical History of America*, vol. viii. pp. 416 *et seq.* Many were published, with a Life, by Chief-justice John Marshall (5 vols. 1804); and a new edition of his complete works, containing many letters and papers not previously published, has been prepared by Worthington C. Ford (vol. i. New York, 1888). The Life by Washington Irving (5 vols. 1855–59; abridged and revised by John Fiske, 1888) must be mentioned out of many. The best study of Washington as a man is Henry Cabot Lodge's *George Washington* ('American Statesmen,' 1889); see also Gen. B. T. Johnston's *Washington* ('Great Commanders,' 1893) and Thackeray's *Virginians*.

Washington and Lee University, at Lexington, Virginia, was founded in 1782 by the Rev. William Graham as an academy at Timber Ridge meeting-house, was afterwards developed into Washington University, and finally received its present name in honour of General Robert E. Lee, who after the civil war became its president. He is buried in the college chapel, where a noble recumbent statue in marble marks his resting-place.

Washita, or OUACHITA, a tributary of the Red River (q.v.), in Arkansas and Louisiana, noted for its novaculite Whetstones (q.v.).

Wasp, a popular name for Hymenopterous insects belonging to the family Vespidæ, or to

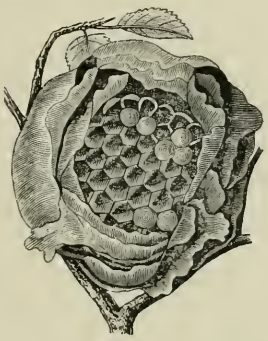
closely related families. Thus the Sphex (q.v.) is a wasp in the wide sense, but it is not a member of the family Vespidæ. All the stinging Hymenoptera to which the title wasp may be applied differ from bees (Apidæ) in the character of the first tarsal joint of the hind-leg, which is neither very broad nor very hairy; nor do they store honey as is the habit of so many bees, but simply prey upon the sweet juices of fruits and other parts of plants. The true wasps of the family Vespidæ are further characterised by the way in which the anterior wings are longitudinally folded, each being doubled on itself down the middle, and by the nature of the antennæ, which are usually 'kneed' at the end of the first joint, and have thirteen joints and a clubbed end in the males, twelve joints and hardly any apical thickening in the females. Moreover, as is well known, wasps are generally more slender and much less hairy than bees. About 1000 different species of Vespidæ are known; representatives are found in almost every part of the globe; many live socially, and like the social bees have workers in addition to the two sexes; others are solitary in habit and without workers.

The social wasps—e.g. species of Vespa and Polistes—build papery nests which in intricacy and beauty of architecture rival the achievements of the hive-bees. Begun by the queen-wasp, who alone survives the winter, and completed by those of her offspring who develop into workers, these nests are composed of masticated vegetable matter, generally woody fibres worked into a paste with the viscid secretion of the salivary glands. A variable number of combs, each one cell deep, are connected together by a scaffolding of the same material, and often surrounded by external walls with one door in aerial nests, usually with two in those which are built underground. The cells, which are used as cradles for the developing eggs and grubs, are hexagonal in outline, and their openings generally look downwards. The site of the nest is very varied: the Hornet (q.v.; *Vespa crabro*) usually chooses the hollow of a tree, the common wasp (*V. vulgaris*) builds in the ground, the wood-wasp (*V. media*) hangs its oval nest from the

Nest of Wood-wasp (*Vespa media*).

branches of a tree. Moreover, within one species there is no rigid adherence to one situation; thus the nests of the hornet and the common wasp are often built under the eaves of houses. Nor is the framework always of a papery texture, for some species of Polybia common in South America use earthy materials. In size too there is great variety, from a few inches in girth to five feet in length, and within the same species there are wide limits according to the strength and prosperity of the society.

In illustration of the annual life of the social Vespidæ, the history of the common British wasp may be outlined. As in other wasps of temperate countries, the sole survivor of the winter is a queen or female who has lain in shelter since her impregnation the previous autumn. In early spring she awakens from her torpor and seeks a site for the nest. A suitable hole is found, a foundation of wood-scrapings is laid, a foot-stalk is reared to support the first two or three layers of cells, these are covered by an umbrella-like roof, and an egg is laid in each. More cells are made, and more eggs are laid. As the first laid eggs hatch, the walls of the cells are raised in relation to the increasing size of the grubs, which eventually shut themselves in with a silken lid. During growth, however, they have required food—nectar from flowers, juices of fruits, honey stolen from the bees, and the like—and the mother-wasp has a busy life. But the period of pupation is short, and soon there emerge workers who lighten their mother's labours. They make more combs, the female lays more eggs, more workers are born, and, as autumn draws near, females and finally males. The young females and the males quit the nest in a nuptial flight which secures the continuance of the species, while the workers left in the nest evict the remaining grubs, and themselves await death. In some cases the story is complicated by the fact that the rudimentarily sexual workers may produce parthenogenetic eggs which develop into males. The food of wasps consists of the juices of plants, sweet fruits, the nectar of flowers, and honey-dew, but they are sometimes carnivorous, preying upon other insects, larvæ, spiders, and even on the corpses of larger animals. All who have sat at lunch in the country during a hot summer know with what pertinacious daring the wasps which enter by the open windows attack not sweets only, but all sorts of palatable viands. Although wasps are very destructive of fruits, it must be noted in their favour that many of them destroy other insects, grubs, and caterpillars. The stinging-organ is, as usual, an ovipositor, and not of course possessed by the males. In structure and mode of action it generally resembles that of Bees (q.v.). The poison which enters the wound made by the sharp little instrument produces painful inflammation, especially in the case of hornets, but unless the stings be numerous injurious results are rare. It is well, however, to take means to allay the inflammation—e.g. by hot-water fomentations, or by the homely remedies of indigo-blue and soap and sugar, which are usually sufficiently effective.



Nest of Common Wasp (*Vespa vulgaris*) seen from below.

The solitary wasps, also included in the family Vespidæ, have no workers; they usually build single cells of clay or sand; and they are also distinguishable structurally from the social forms. Thus the mandibles are generally long and narrow, not broad, the tarsal claws are toothed, and so on. They are generally smaller than the social wasps, and darker in colour. The nest is oftenest in a hole, and is very generally provisioned with insects

or insect-larvæ for the use of the offspring. A well-known representative is the Wall-wasp (*Odynerus parietum*), common in Britain and throughout Europe; it digs a hole in walls and builds a projecting tubular porch, at first straight, but towards the end bent downwards; the hole is stocked with paralysed grubs and caterpillars, and among these an egg is laid. Other common genera are Eumenes and Pterochilus.

Besides the Vespidæ there are, as has been already noticed, a number of families the members of which may be popularly called wasps. Thus there are the burrowing sand-wasps or Crabronidæ, —e.g. Sphex (q.v.), Ammophila, Crabro, Dinetus, Bembex; the nearly related Pompilidæ, with similar habits—e.g. Pompilius (one species of which preys upon the large spider Mygale), Priocnemis, Pogonius, Cercopales; the Heterogyna—e.g. Sapyga, which usurps the burrows of other insects, and Mutila, whose larvæ are parasitic in the nests of humble bees; the small golden wasps, cuckoo-flies, or Chrysididæ—e.g. Chrysis—which lay their eggs in the nests of bees or wasps.

More distantly related to the wasps are those Hymenoptera in which the females have, instead of a sting, a boring ovipositor, by means of which the eggs are laid in other insects or in plants. Such are the Ichneumonidæ, Evaniidæ, Braconidæ, Chalcididæ, Cynipidæ, Uroceridæ, &c.

See Bees, Insects, Sphex, Stinging Animals; Lubbock's *Ants, Bees, and Wasps;* the continuation of Buffon (Par. 1836–46); Saussure on the Vespidæ (Par. 1852–57); and German works by Schenk (1861) and Taschenberg (1866).

Waste Lands, according to the general use of the term, are uncultivated and unprofitable tracts in populous and cultivated countries. The term waste lands is not employed with reference to land not reduced to cultivation in countries only partially settled. There is a large extent of waste lands even in the British Islands. Of the 77,800,000 acres which they contain only about 48,100,000 are arable land and improved pasture; 3,000,000 acres are occupied with woods and plantations; about 7,000,000 acres in Scotland consist of sheep-pasture, generally at a considerable elevation, and little improved by art; 8,000,000 acres in Ireland are unenclosed pasture, generally quite unimproved; over 4,000,000 acres are mountain and bog; and the remainder consists of unimproved and very unproductive land of other kinds.

The waste lands of Britain are of very various character. Some of them are bogs, already sufficiently noticed in the article Bog. Others are marshes and fens, generally very near the level of the sea, and often within the reach of its tides, chiefly in the eastern counties of England (see Bedford Level). There are also extensive moors both in England and in Scotland, often of very poor soil, and often also at such an elevation above the level of the sea as to render profitable agriculture hopeless. This is not the case with all the moors, and it is sometimes possible to effect great improvement by drainage; so that land, formerly almost worthless, may be converted into good pasture. The highest sheep-pastures of the south of Scotland have been greatly improved by a kind of superficial drainage (*sheep-drains*), consisting of mere open channels for water; but in the greater altitudes of the Highlands, and amidst their more rugged steeps, even this is out of the question. The chalk *downs* of the south of England may, in great part, almost be considered as waste lands, although in several parts they afford excellent pasture for sheep; while in certain districts they have been found capable of great improvement, in a slow and gradual manner, by tillage and the application of manures. Sands near the seashore are fixed by sowing certain grasses, and are capable of further improvement by cultivation and the application of manures; particularly where the sand is in considerable part calcareous. The most barren and hopeless sands are those which are almost entirely siliceous.

In Scotland, during the first eighty years of the 19th century, a large extent of waste land was by reclamation transformed into fairly good arable land. This process of reclamation was pursued to a lesser or greater extent in all the counties embracing mountain or moorland. It was most active in the northern counties, notably in the county of Sutherland, where between 1870 and 1880 the Duke of Sutherland expended nearly £200,000 in the reclamation of land. The Sutherland reclamations attracted great attention at the time, and were visited by many agriculturists from foreign countries as well as from distant parts of the United Kingdom. Viewed financially the reclamations have not been successful. The cost of the work was great, from £22 to as high as £65 per acre, and the benefits resulting from the reclamation have been lessened by the fall in the prices of agricultural produce. Already portions of the land have returned to a semi-waste condition. The advance in wages and the decline in the prices of agricultural produce have brought land reclamation almost to a stand-still.

See the articles Common, Drainage, Holland, Irrigation, Landes, Peat, Polder, Warping, Zuider Zee.

Waste Products, Utilisation of. By 'waste' is generally meant such material as is rendered either wholly or partially useless in the manufacture of products and articles of all kinds, but the name is sometimes retained long after a substance, at one time of little or no value, has been utilised. 'Waste-silk,' for instance, is now a valuable material, although this name for it is kept up. If envelopes are cut out of a roll of paper, parts of dress out of a web of cloth, and round covers out of sheets of tinplate, 'waste' pieces are unavoidably left. There would be more loss than gain in manufacturing such materials into the shapes required for specific articles. Again, when iron ore is smelted, or coal distilled, or common salt converted into soda, waste in some form results from the operations. In every manufacturing process, mechanical or chemical, there is waste. The examples given relate to new waste, but nearly everything we use wears, or corrodes, or gets broken or unshapely, and so rags, and rust, and scraps arise. Rags of all kinds are nowadays so much in demand that they are only waste in a nominal sense. On the other hand, the rust which arises from corroding iron is utter waste, since it can never be profitably collected at all. In respect to the value of 'waste,' these two, among familiar things, may be taken as at opposite extremes.

There is a kind of waste, for the most part difficult to prevent, which goes on in the consumption of fuel, and in certain processes of roasting or calcination in the smelting of metals. Roundly speaking, the best designed steam-engines and boilers require only half as much coal per horse-power per hour as those less skilfully constructed, and the fuel unnecessarily consumed by bad boiler-furnaces is largely wasted as smoke through imperfect combustion. The Siemens regenerative furnace (see Vol. V. p. 239) is most ingeniously constructed for the saving of waste heat. The utilisation of blast-furnace gases (see Iron) for heating purposes, and the recent recovery of Tar (q.v.) and ammonia also produced by the coal consumed in these furnaces, form an instance of a double saving from the same source. In the report of the chief-inspector of alkali works for 1891, it is stated that the plant put up in recent years for collecting tar, ammonia,

&c. at fifty-seven Scotch blast-furnaces has cost £444,600, a sum fully equal to the cost of building the furnaces themselves. The condensing flues, miles in length, connected with some lead-smelting furnaces (see LEAD) are modern examples of appliances to condense lead fume or smoke which formerly was allowed to escape, causing much loss of lead. In striking contrast to these we may state, while speaking of gaseous products, that over a large district in the south of Spain where cupreous iron pyrites occurs abundantly the barbarous practice is being continued of burning this pyrites in the open air (to get rid of its sulphur and so lighten its weight), to the destruction of vineyards and other vegetation, and to the loss of an enormous amount of sulphur sent into the air in the form of sulphurous acid. The acid used in 'pickling' iron plates which are to be tinned or galvanised is now recovered. See GALVANISED IRON, and TINPLATE; also NAILS, for use of tinplate scraps.

Some instances of how waste in a solid form arises in working rock and other mineral substances may now be given. In shaping and dressing granite paving-stones as much as three-fourths of the rock quarried is, in some instances at least, wasted. This waste is as yet only very partially utilised for road-metal, and in small chips for 'granolithic' pavements. Coal 'dust' is made into Briquettes (q.v.) for burning in fires. The utilising of the vast waste heaps of spent shale at the Scotch mineral-oil works is a problem which awaits solution. The oil shale of the carboniferous formation in Scotland, from which Paraffin (q.v.) and paraffin-oil are obtained, was itself looked upon as of no value till 1859. Blast-furnace slag (see SLAGS) is now utilised in several ways, and in a number of cases the accumulations of other kinds of slag on the sites of ancient smelting-works have, in modern times, been again put through the furnace to extract the metals left in them, with profitable results. Some of the refuse from the old silver-mines of Laurium (q.v.) has been bought up by capitalists for this purpose. One instance, though not of very recent date, may be given where, by the production of a by-product, a fortune was very quickly amassed. About 1840 Mr Askin of Birmingham discovered a method of separating cobalt, in the form of oxide, from nickel, two metals which were very difficult to separate. This oxide of cobalt was at first a waste product, but before very long it was put into the hands of potters, who readily bought it up to produce a blue colour on their ware, at the then rate of two guineas per pound. Among comparatively recent instances of utilisation of by-products and waste products in the chemical industries, we may refer to the importance of the substances now extracted from Coal-tar (q.v.), and the great value of some of them in the manufacture of dyes (see DYEING). Another example is the recovery of binoxide of manganese in the production of chlorine for the manufacture of bleaching-powder by Weldon's beautiful process. Formerly for every 100 lb. of bleaching-powder made about 100 lb. of the native oxide of manganese were required. Now this manganese is recovered and used again and again in the process, with only a loss of about 5 per cent. to make up each time it is returned to the chlorine still. The earlier methods of recovering manganese were not nearly so perfect, and therefore were not much used. A process for the utilisation of chemical waste on a great scale is Chance's method, patented in 1888, of recovering sulphur from akali makers' black-ash refuse (see SODA).

Passing to vegetable substances, the various materials besides Rags (q.v.) used in the manufacture of paper may be first noticed. Straw, wood, and esparto fibre, if not exactly waste products, were at least undeveloped substances before they became, as they now are, so largely used in paper-making. Old ropes, flax and jute mill waste, old or torn pieces of paper of every kind, are all serviceable in paper-mills or in the manufacture of Millboard (q.v.). In the pulp of the latter old newspapers bulk largely. Cotton waste is much used by mechanical engineers for cleaning purposes. Sawdust (q.v.) is employed in several ways. Cork-cutter's waste has become of high importance in the manufacture of linoleum and cork-carpet (see FLOORCLOTH). From the bark stripped from osier wands the useful medicine salicin is now made. In days not so long past the spent madder of our large dyeworks was suddenly raised from a useless to a valuable material by treatment with sulphuric acid, which converted it into the dye called garancin. Madder itself, which till 1869 held a chief place among our dyestuffs, has since become of trifling importance, through the introduction of artificial Alizarin (q.v.). This is hardly the place to refer to the utilisation of Peat (q.v.), but it may be remarked that this material, so abundant in Ireland and Scotland, is in Russia, Germany, and Holland turned to profitable account in several ways, by methods which have not yet succeeded in Britain. From the seaweed thrown up on our shores iodine is obtained, but, although some is also used as manure, much of it is allowed to decay (see KELP). It is to be hoped, therefore, that the Algin (q.v.) which has been prepared from it will become a marketable product.

One of the most interesting examples of what has been done in converting a waste animal product into a highly useful material is seen in the case of waste-silk. Cocoons do not yield half their weight of reeled silk, but the remaining 'waste' portion has, through the ingenuity of an English inventor, become the raw material for a large spun-silk industry (see SILK). In Venice artificial flowers for ladies' head-dresses are made of imperfect cocoons. The various kinds of waste from woollen mills and from the cutting up of woollen fabrics are either worked up again into yarn or felt, or are ground into flock for paper-hangings (see SHODDY, and WALL-PAPER). Glue (q.v.) is made from parings of hide and from bone. The turnings and dust of the ivory and bone turner have various useful applications. Prussiate of potash (see FERROCYANOGEN) is made from almost any waste animal matter, such as parings of horns and hoofs, hair, blood, leather-cuttings, and even field-mice.

Wasting Palsy is one of the terms applied to the disease described at LOCOMOTOR ATAXIA. See also PARALYSIS.

Wast Water, in the Lake District (q.v.), Cumberland, 14 miles SSW. of Keswick, is a lake 3 miles long, ½ mile wide, 204 feet above sea-level, and in places 260 feet deep.

Watch. See HOROLOGY.

Watch, on Shipboard, a division of the crew into two—or if it be a large crew into three—sections, that one set of men may have charge of the vessel while the others rest. The day and night are divided into watches of four hours each, except the period from 4 to 8 P.M., which is divided into two *dog-watches* of two hours' duration each. The object of the dog-watches is to prevent the same men being always on duty at the same hours.

Watch-night. See NEW YEAR.

Water. In a state of purity, at ordinary temperatures, water is a clear transparent liquid, perfectly neutral in its reaction, and devoid of taste or smell. Its chemical constitution, indicated by the formula H_2O (molec. wt. = 17·96), is 2 parts of hydrogen to 15·96 parts of oxygen by weight, or very nearly two volumes of hydrogen to one

volume of oxygen, which upon combustion form by their combination two volumes of water-vapour. The specific density of water at 4° C. is taken as the standard, and is reckoned equal to unity, or for some technological purposes as 1000. Water is used in the metric system as the means of connecting the measures of length and those of mass : a cubic decimetre measures a litre, and a litre of water at 4° weighs a kilogramme. Similarly the Gallon (q.v.) is ten avoirdupois pounds of water. The specific density of steam, reckoned (ideally) at 0° C., is 0·6235 (air = 1) or 0·0008063 (water at 4° = 1) ; that of ice is 0·94. If water be cooled to 0° C. (32° F.), it freezes if it be maintained at or below that temperature ; it *may* be cooled even to − 10° C. (14° F.), if it be free from air-bubbles and kept very steady, without solidifying ; it then has a sp. gr. of 0·998145 ; at − 5° C. it has a sp. gr. of 0·999118. If a block of ice at say − 10° C. (14° F.) be heated, its temperature first rises until 0° C. (32° F.) is reached ; its specific heat during this stage is 0·502° ; when it reaches 0° C. the ice begins to melt, but the temperature becomes stationary, remaining at 0° C. until all the ice has been melted. This takes place when 80·025 gramme-calories of heat per gramme have been absorbed ; the latent heat of water is thus said to be 80·025. The water at 0° C. occupies less volume than the ice in the ratio of 94 to 100 nearly. At 0° C. the sp. gr. of water is 0·999871. As the heating is continued the temperature rises ; the specific heat in this stage is 1, water being the standard substance for the measurement of specific heat ; at 4° C. (39·2° F.) the sp. gr. is 1·000, water being then at its maximum density. There is thus a shrinkage in bulk between 0° C. and 4° C. ; but as the heating is continued the water begins to expand, the specific heat slightly increasing ; at 10° C. (50° F.) the sp. gr. is 0·999747 ; at 50° C. (122° F.) it is 0·9882 ; and at 100° C. (212° F.) it is 0·95865 ; thus 1 volume of water at 4° C. becomes 1·043 volumes of water at 100° C. As the heating is continued the water begins to boil : the temperature remains constant, apart from irregularities induced by superheating and consequent explosive bubble formation and the presence of impurities (see Boiling-point) : this goes on until the whole is converted into steam. Heat is absorbed in this operation equal to 536·5 gramme-calories per gramme. This steam has a temperature of 100° C. ; its specific density will therefore be (273 ÷ 373) × 0·0008063 = ·00059014, and it will occupy 1694·5 times the bulk of the water at 4° C. If the steam be still further heated, it expands or exerts pressure like an ordinary gas : its specific heat is 0·4805 at constant pressure, 0·2989 at constant volume. If water be heated in closed vessels beyond 100° C., it exerts great pressure on account of its own expansion and its tendency to form steam ; but it has been inferred from the variations in the latent heat of evaporation of steam at different temperatures that, if water could be exposed to a temperature of 720·6° C. without bursting the containing vessel, it would present the phenomena of the critical state (see Gases).

Water dissolves a great many substances, forming aqueous solutions. Its solvent powers for solids and liquids are in general increased by heat, while those for gases are diminished. When water is superheated (above 100° C., under pressure) it can even decompose some silicates such as plate and crown glass and extract the alkali, leaving silica. The following proportions by volume of the respective gases are soluble in water under a pressure of 76 cm. mercury column at 0° C. (32° F.) and 20° C. (68° F.) respectively : hydrogen, 0·0193 and 0·0193 ; nitrogen, 0·02035 and 0·01403 ; atmospheric air, 0·02471 and 0·01704 ; carbonic oxide, 0·0329 and 0·02312 ; oxygen, 0·04114 and 0·02838 ; carbonic acid, 1·7987 and 0·9014 ; sulphuretted hydrogen, 4·3706 and 2·9053 ; sulphurous acid, 79·789 and 39·374 ; ammonia, 1049·6 and 654·0. In some cases there is heat evolved when the gases dissolve. Hydrochloric acid evolves heat, but this is not a case of simple solution ; there is some chemical combination ; the gas and the water do not part company when heat is applied, but gas or water is given off until the solution attains a particular strength, after which it distils bodily. Some liquids dissolve in water by a process of interdiffusion ; and salts dissolve each in its own proportion, which varies with the temperature. Heat is often evolved by the act of solution if there be chemical combination between the salt and the water with formation of *hydrates ;* but if there be no such union, then the absorption of heat in liquefying the salt results in cooling. These two effects may more or less completely balance one another. Water may combine with an anhydrous acid, playing the part of a base and forming a salt of hydrogen, with evolution of heat : thus $SO_3 + H_2O = H_2SO_4$, sulphuric acid or hydrogen sulphate, analogous to K_2SO_4, potassium sulphate. Similarly it may combine with an anhydrous base, forming a hydrate : $K_2O + H_2O = 2KHO$. In these cases the water cannot, in general, be expelled by simple heating. When it combines with salts, being taken up by them in the act of crystallising, it is in many cases essential to the form of the crystal, but can be expelled by heating ; the crystal in that event crumbling into powder : and such water contained in a crystal is called *water of crystallisation*. Beyond this there is often some *water of constitution* present : if the attempt be made to drive this off by continued or higher heating, the salt is decomposed. Crystals of sulphate of iron, $FeSO_4,H_2O + 6H_2O$, illustrate this ; on gentle heating, the water of crystallisation is driven off and $FeSO_4,H_2O$ is left : if this be further heated it is decomposed (see Sulphuric Acid).

Water is very slightly compressible : a pressure of 1 dyne per sq. cm. causes a reduction in volume of 1-20,700,000,000th ; a pressure of one atmosphere (1033·3 dynes per sq. cm.) one of 1-20,033d. For many practical purposes, therefore, water may be regarded as incompressible. In the liquid state it is colourless in small quantities, blue-green in large masses, and blue in still larger masses : and it has a refractive index of 1·3324 for the sodium line D at 15° C. In the form of ice its crystals have forms derived from the rhombohedron and six-sided prism, and are doubly refracting, with an index of 1·3060 for the ordinary and 1·3073 for the extraordinary ray (red light). Water-vapour has a refractive index (Mascart) of 1·000257. Water is slightly diamagnetic, and in the pure state has no electric conductivity. The least trace of substance in solution confers electric conductivity upon it ; and then, when a currrent is passed through it, it is decomposed or *electrolysed*, hydrogen being set free at the negative electrode as if it travelled with the current, and oxygen at the positive electrode (against). Water-vapour may be decomposed by a very high temperature ; and this limits the temperature attainable in the oxyhydrogen flame, for the combination of oxygen and hydrogen is arrested when a certain temperature has been reached. Water-vapour is readily decomposed by oxidisable substances, such as glowing iron or coke ; but the heat must be kept up in order to supply sufficient energy for the decomposition of the water-vapour. In the former case the products are hydrogen and magnetic oxide of iron ; in the latter, water-gas. But if hydrogen is passed over glowing oxide of iron or copper, the oxide is reduced to metal, and water-vapour is formed.

Absolutely pure water is not to be found in nature, since water always finds something to dissolve even as it falls through the air in the form of rain : rain-water contains not only atmospheric air ($2\frac{1}{2}$ vols. per hundred), but also some ammonia and carbonic acid and traces of nitrates, together with salts derived from dust. The principal tests to which water is subjected in order to determine its impurities are examination of colour, taste, smell after being shaken up; analysis of the residue left after evaporation, for silica, iron, alumina, lime, and magnesia; acidifying with hydrochloric acid, and estimating the sulphuric acid by means of barium chloride; determination of the chlorine present; estimation of nitrates and nitrites (these being of importance as indicating oxidised organic matter and showing that the water had passed through organic matter); determination of the free ammonia and of the total amount of ammonia producible by reductive processes from the organic matter present in the water (albuminoid ammonia); estimation of the carbonic acid. The hardness of water is determined by making a solution of soap of such a strength that a standard volume of it will take a given quantity of barium chloride, and then be just able to froth on shaking. This standard soap-solution is then dropped into a measured quantity of the water to be tested, which is shaken after each addition, until frothing begins: from the quantity of soap-solution used, with the aid of a table (for the quantity of lime or magnesia salts present and the quantity of soap-solution used are not directly proportional to one another), the total hardness—i.e. the quantity of lime salts present, which curdle and waste soap by forming insoluble lime-soap—is determined. In another sample the carbonates of lime and magnesia are removed by boiling, and the above test then applied after cooling: this determines the 'permanent hardness,' due to sulphates of lime and magnesia. In both cases control experiments are made by removing the lime and magnesia by means of oxalate of ammonia, and then testing with soap. The results are expressed in 'degrees of hardness,' which in England mean grains of $CaCO_3$ (or their equivalent in magnesia carbonate, or in sulphates of lime or magnesia) per gallon, in France centigrammes $CaCO_3$ per litre, and in Germany centigrammes CaO (or its equivalent in MgO) per litre.

The question as to who was the discoverer of the composition of water—the great Water Question—takes rank in the history of chemistry as the controversy as to the discovery of the calculus and of the planet Neptune in other sciences. Brougham, Brewster, Kopp, Arago, Dumas, and many others have maintained one or another of the theses; and the claims of Cavendish, James Watt, Priestley, and Lavoisier have been canvassed and defended. Research seems inclined to give the priority to Cavendish, while allowing that Watt made independent experiments and came to similar results soon after.

See Dr George Wilson's *Life of Cavendish* (1846); Muirhead's *Watt* (1854); and Thorpe at the British Association in 1890. See also articles on Sea, Mineral Waters; and on Boiling-point, Electricity, Evaporation, Freezing, Gas and Gases, Gas-lighting (for water-gas), Heat, Hydrogen, Ice, Magnetism, Melting-point, Metre, Oxygen, Refraction, Snow, Solution, Specific Density, Steam. For Water on the Brain (or in the Head), see HYDROCEPHALUS.

WATER-POWER.—Strictly speaking, says Professor Unwin, there is no such thing as water-power. The term is convenient but inaccurate; for whether the water descends on a water-wheel or actuates a pressure-engine, it is merely an agent of transmission, and water-motors might with more scientific precision be designated gravity-motors. The term water-power is, however, a convenient one, and is universally understood and accepted. The primary source of water-power is the evaporation of liquid water by the solar heat from the earth's surface and the sea. The vapour thus formed condenses in the upper and colder regions of the atmosphere, and falling as rain flows as streams from a higher to a lower level, exerting in such descent an amount of energy proportional to its weight and volume. By suitable mechanical appliances a portion of this energy can be utilised for industrial and economic purposes. The science and practice of collecting, storing, distributing, and beneficially employing the rainfall of a district constitutes an important branch of engineering.

The utilisation of water-power by means of mechanical contrivances dates far back into the world's history. The ancients appear to have fully appreciated the advantages of the water-wheel, though they used it chiefly for the purpose of raising water for irrigation. The Egyptian wheel may still be seen on the Nile; and similarly on the Euphrates, &c. the original form and use of the water-wheel are retained. Notably amongst eastern nations the Chinese were conversant with water-motors from a very early period. The first attempts to produce hydraulic machinery proper, as the term is now understood, were in the Greek schools at Alexandria which flourished under the Ptolemies, under whose regime Ctesibius and Hero (q.v.) invented the fountain of compression, the siphon, and the force-pump about 120 B.C.

Water-power engines are divisible into five sections, and are classified by Professor Rankine as follows: (1) Water-bucket engines, in which water poured into suspended buckets causes them to descend vertically, and so to lift loads or overcome other resistance, as in certain hydraulic hoists. (2) Water-pressure engines, in which water by its pressure drives a piston. (3) Vertical water-wheels, being wheels rotating in a vertical plane and driven by the weight and impulse of water. These are the most common of all water-power engines. (4) Horizontal water-wheels or turbines, being wheels rotating in a horizontal plane, and driven by the pressure and impulse of water. (5) Rams and jet-pumps, in which the impulse of one mass of fluid is used to drive another. The action of the water may be distinguished as taking place in three ways —(*a*) by weight, (*b*) by pressure, (*c*) by impulse.

I. Water-bucket engines constitute an exceedingly simple type of contrivance for utilising directly the weight of water. Buckets filled with water at a high level discharge themselves on descent to a lower one, having dragged up passengers, merchandise, &c. Power is, and has been for centuries, similarly obtained for stamping, threshing, and kindred purposes in primitive districts where water is abundant and rude appliances alone procurable.

II. Water-pressure engines may be either single or double acting. Fig. 1. represents a reciprocatory hydraulic engine, whose action is similar in principle to that of the ordinary non-condensing steam-engine. The water under pressure is admitted at one end of a cylinder *a*, the escape valve *d* at the same end being simultaneously closed, and the corresponding valve on the other side opened. In this manner the alternating action of valves and piston is continuous. For smooth and effective work the piston area should be large and the speed slow. For mining and kindred operations, where water-power is available and fuel scarce, pumping, hauling, &c. is largely and advantageously performed by such engines. In towns where sufficient pressure can be obtained from the mains, engines of this class are useful for furnishing small power. Under circumstances where steam-power is inconvenient or

unsafe, as in mines, docks, &c., hydraulic-power is extensively adopted. Hydraulic presses, cranes, hoists, &c. are largely employed, generally in connection with an accumulator.

III. Vertical water-wheels may be divided into three classes, and are thus described by Sir William

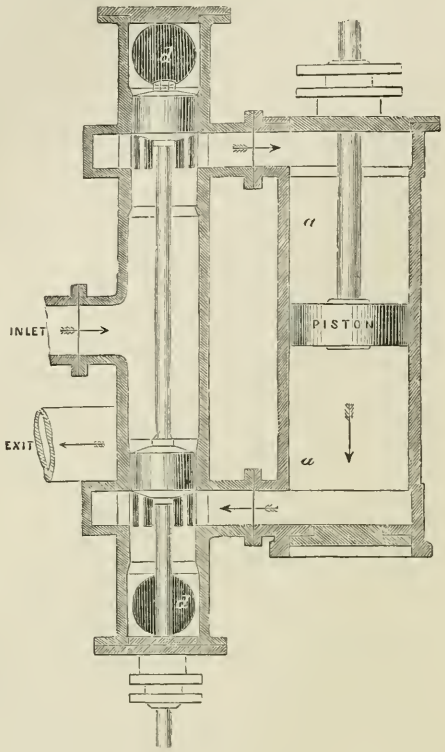


Fig. 1.

Fairbairn—(*a*) Overshot wheels, where the water is applied over the crest or near the upper extremity of the vertical diameter; (*b*) Breast-wheels, where the water is applied below the crest at the side of the wheel; (*c*) Undershot wheels, where the water is applied near the bottom of the wheel and acts (1) by gravitation as in the improved undershot wheel, or (2) by impulse as in the ordinary undershot and Poncelet wheels. With falls varying from 10 to 70 feet, and supplying from 3 to 25 cubic feet of water per second, a wheel may be constructed on which the water acts chiefly by its weight. If the

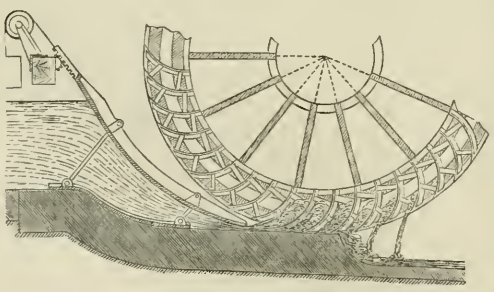

Fig. 2.—Poncelet Water-wheel.

variation of head-water does not exceed 2 feet, an overshot wheel may be used. With greater variation of head-water level, a pitch-back or high breast-wheel is better. When the fall does not exceed 6 feet the best water-motor to adopt in many cases is the undershot wheel with curved palettes invented by General Poncelet (1824). The ordinary undershot wheel develops only about 25 per cent. of the work of the water, whereas the Poncelet wheel utilises 60 per cent. of such work. The principle of this wheel, much used in France, lies in the water being received by the curved floats without any shock and finally discharged with a small velocity.

IV. Horizontal water-wheels or turbines are water-wheels with vertical axes, receiving and discharging water in various directions round their circumference. Fig. 3 represents in plan a reaction wheel. The water on admission from below passes upwards through the passages *a*, *a*, and escaping by tangential orifices, *b*, *b*, at the circumference —as indicated by the arrows traversing them—produces a reactionary motion of the wheel in the direction of the arrow *c*. The earliest form, known as Barker's Mill (q.v.), discharged water from straight tubular arms projecting from a hollow shaft. Fourneyron perceived that for water to leave the wheel without waste of energy, it must receive some initial forward velocity before entering, and his introduction of guide blades for this purpose formed the main feature of his important invention. Turbines are divisible into three classes, according to the direction in which the water moves before reaching the guide blades, and after leaving the wheel—viz. (1), parallel, (2) outward, and (3) inward flow turbines. By means of turbines or otherwise, water-power may be used to generate dynamo-electricity for the manufacture of aluminium, the carbides needed for acetylene, &c., as at Foyers; or for general manufacturing purposes on a vast scale, as at Niagara (q.v.).

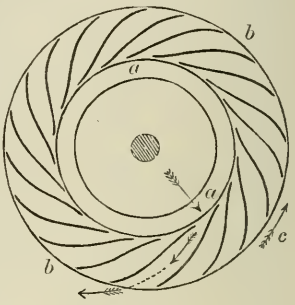

Fig. 3.

V. Two other classes of machine fall to be noticed —(*a*) Those in which the energy of a mass of liquid descending from a small height raises a small portion of that liquid to a greater height as in Montgolfier's hydraulic ram; and (*b*) those in which a stream of fluid moving at first with a certain velocity drives and carries along with it an additional stream, the two streams finally mingling together and moving with a velocity less than that of the driving stream—as in the jet-pump, the water-blower, the blast-pipe, and the injector.

See Archimedes' Screw, Barker's Mill, Blowing-machines, Crane, Hydraulic Press, Hydraulic Ram, Hydrodynamics, Pumps, Injector, Iron (p. 217), Tides, Transmission of Power.

Water-supply.—In old times kings and communities made artificial channels and conduits to convey good water in large quantities to important towns. Hezekiah made a pool and a conduit and brought water into the city; and the remains of Roman aqueducts in the Campagna; near Nimes; and in many parts of the world give evidence that water-supply was well cared for in past ages (see Aqueducts). The fact that water would, in an inverted Siphon (q.v.), stand at the same level in both legs, must have been observed; and it could not have been from ignorance of this circumstance that water was not conveyed across deep valleys by means of siphons. Indeed it appears

that in the time of the Emperor Claudius there was constructed a conduit 13 leagues in length to supply a palace near Lyons; it traversed eight valleys by means of aqueducts, but in the case of the ninth valley the water was conveyed across by an inverted siphon, consisting of nine lines of leaden pipes, each pipe being 8 inches diameter and 1 inch thick. No doubt, therefore, it was the want of any such material as cast-iron for large pipes, and the consequent necessity of multiplying small pipes (small, to resist the pressure) in lead or in wood, that caused the hydraulic engineer of those days to prefer the grand masonry aqueducts.

Sources of Supply.—These sources all owe their being to that great heat-engine the sun, which vaporises the waters of the sea and produces the currents of air that convey these vapours to the land, where they are condensed into mist or rain or dew, and are gathered from little rills and streamlets into rivers, falling eventually into the ocean, with or without the intermediate receptacle, the lake; or, on higher grounds and in colder regions, fall as snow. Not only does the sun raise vapour from the waters of the ocean, but also from the surface of lakes and rivers, and from the moist earth and its vegetation, and even from the surface of ice, and does so without bringing that ice into the liquid condition. When the nature of the soil is favourable, a very large portion of the rainfall sinks in and traverses below by percolation, or in fissures, producing *Springs* (see SPRING); or else it continues its concealed course the whole way to the sea, or to some river, and is delivered sometimes above the sea-level, sometimes below it, so that in places fresh water can be gathered from among the shingle directly the ebbing tide has removed the cover of salt water. Under all circumstances the cycle—of evaporation, transport of vapour, condensation, and return to the liquid state, to be again evaporated—goes on, and thus, in the words of the Wise Man, 'All the rivers run into the sea, yet the sea is not full; unto the place from whence the rivers come thither they return again.' Springs may be found in proximity to a population, and issuing at a sufficient height to supply that town by gravitation. But more commonly springs issue at levels not sufficiently elevated to directly supply a town, and then recourse must be had to pumping. In mountainous countries it is quite possible to find *streams* near towns at such elevations as to admit of a supply by gravitation; and for towns more remote, it is a mere matter of engineering to convey the waters of such streams by means of aqueducts and pipes, so that the pressure (less the loss needed for 'head' to produce the flow) shall be maintained, and the distant town shall still be supplied by gravitation. In a plain country, far removed from an elevated supply, the best plan may be to pump from the neighbouring river. *Wells* in almost all cases demand the use of pumping-power. For even in true Artesian Wells (q.v.), those which overflow, it is rare that the mouth of the well is at such a level as to enable a supply to be given by mere gravitation. The spring and the river are natural supplies; the well is a product of art; the lake may be natural or be the *artificial lake*, which stores the rainfall from a gathering ground.

Quality of the Water.—That from springs may be of almost any character. It may be saline or ferruginous—in fact it may hold in solution any number of chemicals (see the analyses of renowned spas); it may be clear, bright, and palatable; or may resemble weak chicken-broth, flavoured with rotten eggs. It may give forth volumes of the carbonic acid with which we artificially impregnate waters for potable purposes; or it may be accompanied by torrents of foul sulphuretted hydrogen. Having regard to the great solvent power of water, and to the variety of materials among which subterranean water passes, and to the time it is in contact with these, it is not surprising that when it comes to the surface it should contain some of these various matters in solution. But the water of such springs as are used for water-works purposes is generally clear and bright, acceptable to the palate, and frequently 'hard.' So commonly is deep well water. Not only is there provided a natural means for the aeration of spring and well-waters; but this aeration burns up the organic matter brought down from the surface. It is extremely instructive to notice how a pervious soil—a chalk soil, for example—'breathes,' taking in and expelling air and gases. The breathing, it is true, is long-drawn and irregular, as it depends mainly, if not entirely, on the variation in the barometer. This breathing may readily be observed by closing the folding-doors over a chalk well and applying a lighted candle to the bucket-rope hole, when there will be found an indraught or an outdraught, as the case may be, varying in intensity according to the suddenness and extent of the recent barometrical change. But, though as a general rule springs and deep wells may be relied on to produce water uncontaminated by any matter detrimental to health, there are cases where such waters have been defiled, and are not sufficiently purified by the aeration above mentioned.

A river-supply will be influenced by the character of the gathering-ground, by the amount of spring-water which makes its way into it, and by the condition of the districts through which it passes. The quality of the supply for an impounding reservoir depends on the purity of the gathering area, on its freedom from cultivation, and on the presence or absence of peat.

Filtration, &c.—Waters which in their state of crude supply would not be potable may be rendered perfectly so, and in fact may be distributed in a condition which makes them superior to other waters deemed sufficiently good to be used without any treatment at all. Deposition and filtration will render water that is cloudy, owing to suspended matter, perfectly bright and clear, and it is now well established that filtration has a most important effect in the removal of germs. If possible river-water is not taken even into a depositing reservoir during times of excessive flood; but when received it is allowed to remain until the coarser particles have subsided. It is then drawn off, or more commonly has to be pumped from the depositing reservoir on to the filter-beds. A filter-bed is usually thus constructed: A water-tight tank is provided of some 12 feet deep, and of such area as may be determined upon—an acre is not unusual for large works; the bottom of the tank is formed with a slight fall from all directions towards a draw-off outlet. On the floor of the tank very coarse materials, such as rubble-stone, or irregular lumps of brick from the kiln, are arranged so that while presenting a surface to support that which is put upon them, they afford by their interstices a free flow towards the outlet. On this rough material is laid coarse shingle, then finer, then gravel, and finally sand. The whole thickness from the top of the coarse material to the top of the sand may vary from 2 to 4 feet. The water to be filtered is maintained on the sand-surface to a depth probably of 4 feet, more or less, while the outlet (the filtered water) is held up by adjustable means so as to give such a difference between the level of the water on the filter-bed and that of the outlet as will provide the 'head' needed to cause the water to traverse the sand at the desired rate. This rate varies very considerably, say from

forty to eighty gallons per superficial foot in twenty-four hours; a very fair rate is fifty gallons.

It is advisable in the neighbourhood of towns to cover the reservoirs in which the filtered water is stored. A most useful adjunct to filtration, the invention of Dr William Anderson, has been adopted in certain cases where the source of supply has not been satisfactory. This invention consists in causing the water on its way to the filter-bed to pass through a large slowly-revolving cylinder charged with scraps of metallic iron. The action suggested is that the water on entering the cylinder attacks the metallic iron and forms ferrous oxide at the expense of a portion of the dissolved oxygen; after leaving the cylinder the water regains the oxygen it had lost, and the ferrous oxide is oxidised to ferric oxide. It seems probable that while a small proportion of the organic matter is attacked chemically, the chief action is mechanical and consists in the formation of an insoluble, bulky precipitate, consequent co-precipitation of organic matter, and better filtration through the film of oxide deposited on the sand of the filters. These iron purifiers have been adopted in the United States, in India, on the Continent, and for the Worcester water-supply. Their earliest employment on a commercial scale was in 1881 for the Antwerp Water-works, where the extremely unfavourable crude water of the river Nethe has been successfully transformed into an excellent potable water.

The quantity that can properly be filtered per foot super. per twenty-four hours being known, it is easy to determine what size and number of filters will be needed in work for any given supply—e.g. at fifty gallons per foot 20,000 superficial feet, or roughly, half an acre, would be required for one million gallons per day. But there must be in addition one or more filters, which shall be out of use for the purposes of cleaning. This cleaning consists in taking off the upper part of the sand, washing it thoroughly with filtered water, and restoring the cleaned sand to its place.

Softening.—Well-water and spring-water, if hard, generally contain in solution magnesia or carbonate of lime, or both. The carbonate of lime-water can be softened by Dr Clark's process, as follows. Ordinary quicklime is agitated with already softened water; by a mechanical stirrer, or by blowing in air. After the agitation the water is allowed to settle, resulting in the production of a perfectly clear water containing dissolved (not suspended) lime. A certain quantity of this lime-water—a quantity varying with the nature of the water to be softened, but very commonly $\frac{1}{8}$ of the hard water, or $\frac{1}{9}$ of the whole—is then allowed to run into the softening tank, the water to be softened is delivered into this same tank, and so as to mix with the lime-water. On the mixing of these two clear fluids they immediately become milky. The explanation of the process given by the chemists of the present day is that the carbonate of lime is soluble in water, because the water contains free carbonic acid, and that the addition of the quicklime absorbs this carbonic acid, making the quicklime into a carbonate, and rendering the water incapable of continuing in solution the carbonate of lime it originally contained, or of dissolving the newly-formed carbonate of lime. When the softening reservoir has been filled the water is allowed to stand until, the whole of the carbonate of lime having settled at the bottom, the water remains perfectly bright and clear. This is then drawn off by a hinged draw-off suction-pipe having a floating end which takes the water at about a foot below the surface, and falls as the water is pumped away. As soon as the suction-pipe approaches the sediment in the bottom the drawing-off is stopped, and the softening tank is re-charged for another operation. From six to twelve hours is a sufficient time to allow for the settling. By this process water of 17 to 20 degrees of hardness is readily reduced to a hardness of from 3 to 4 degrees.

Hard and Soft Water.—It is now generally recognised that on the score of health there is nothing to choose between these. Hard water is brisker and more agreeable to the taste, and has a better colour and appearance than soft water as derived from ordinary impounding reservoirs. For general manufacturing purposes the advantage is with the soft water.

A difficulty attending the use of an extremely soft water is its power of attacking the leaden service-pipes and of causing lead-poisoning (see Vol. VI. p. 545). One of the sources of supply to Sheffield gave considerable trouble on this score, but the difficulty has been overcome by the addition of powdered chalk to the extent of from $\frac{1}{2}$ a grain to (rarely) 3 grains per gallon. To set against this defect of soft water, it is alleged that the use of hard water wastes soap. It does seem a matter of regret that the processes of filtration, &c., so needful for the potable and culinary water, should be applied equally to the water which flushes a water-closet, or waters a road, or is used in scouring a floor. A dual supply would be the cure for this, and would also enable small but select sources of water to be distributed through a town in ample quantity for drinking and cooking, while a less good source might serve for coarser purposes.

Distribution.—The object is delivery into every house, and, within reason, to the top story of the houses; and also to provide such a pressure as will give efficient jets of water for fire extinction. Assume, that, either by gravitation or by pumping, the necessary pressure is obtained, the engineer then has to consider his system of distributing mains. These will vary in size from the large arterial mains supplying whole districts down through the lesser diameters supplying groups of streets, or a single street, to the small service-pipe which conveys the water to a single dwelling.

As to the flow of water through pipes, the 'heads' producing the flow being equal in two cases, and the lengths of the pipes being equal, the quantity delivered in a given time will vary as the square roots of the fifth powers of the diameters. That is, if a pipe of a diameter of 1, and of a length of 1, will, under a head of 1, in a time of 1, deliver a quantity of 1, then a pipe of a diameter of 2 will, all other things being equal, deliver a quantity of $\sqrt{2^5} = \sqrt{32} = 5{\cdot}656$ times the quantity.

There are two systems on which water is supplied to dwellings and to districts—viz. the intermittent and the constant, and each of these systems has its advantages and its disadvantages. The intermittent, carried out to its full extent, is a system wherein the water is turned on to a district say for two hours out of the twenty-four, or for a time that is sufficient to fill the receptacles with which on the intermittent system all the houses are provided. In this manner, notwithstanding that the actual expenditure of water within the houses varies most materially according to the hours of the day, the demand on any set of mains can by turning on district after district be kept practically constant, and thus a more uniform pressure can be maintained. Moreover, a low district is prevented from taking away the water from a higher district. The objections to this arrangement are the wages expense of the turncocks, and the chance that in the event of fire there may be delay in turning the water into the district mains. Further, the water

must be received into cisterns, which are too commonly neglected and suffered to become foul.

On the constant system the cistern may be dispensed with altogether, and the water be obtained direct from a tap on the service-pipe. The objections are that water may be wasted by the careless leaving open of a tap, the possibility of the consumer's being left without a supply if a main burst, and the heavy draught on the mains at certain hours, and the consequent reduction of pressure, to the prejudice of the higher districts. When using constant service and where there are considerable differences of elevation in a town, it is expedient to divide the system of distribution into zones of level. Probably the best mode of domestic supply is that where constancy is combined with storage, the potable and culinary water, however, being obtained by direct draught from the service-pipe, and not from the storage-cistern.

Quantity required per Head.—A town supply may be divided into three distinct provisions—that used for domestic purposes proper; that used for municipal purposes, such as road-watering and drain-flushing; and that used for trades. When the supply is computed to allow for all purposes, it is clear the quantity must vary greatly in different towns. In manufacturing districts, where industries are carried on involving the use of water for washing and for dyeing, the water, if of suitable quality and obtainable at a low rate, will be very plentifully used, and so the quantity per head per diem will be largely increased. On the other hand, for domestic and such municipal purposes as road-watering and drain-flushing, it is found that an average of 25 gallons per head per day is ample, even when considering the needs of a strictly water-closet town, and with a liberal allowance of fixed baths and of hot-water apparatus. There are instances in the United Kingdom where it is said 50 to 60 gallons per head per day are used, but investigation would show, that although a quantity equivalent to this rate per head per day may be delivered into the distributing mains, it is never *used*—in fact, could not be *used* by the population. When in a non-manufacturing town such quantities as these are passed into the mains they never come into the possession of the householder, but escape, to a slight extent by leakage in the mains and services, or are wasted owing to improper fittings in the houses, or through the fittings being misused, or badly maintained.

Waste-prevention.—That this excessive quantity of water never comes even to the knowledge of the householder has been fully demonstrated by the use in numerous cases of an implement designed (about 1870) to detect the waste, and to prevent its continuance. This implement, the invention of Mr G. F. Deacon, for many years engineer of the Liverpool Corporation, consists of a meter through which the supply of a district, containing say some 200 houses, is passed. The meter is so constructed that the water in flowing through presses on a metallic disc, suspended by a counter-weighted wire, and capable of moving up and down in a vertical truncated cone. The parts are so proportioned that the height of the disc in the truncated cone is an index of the quantity flowing per hour. By means of a pencil attached to the wire, this height is automatically marked on a paper wound around a drum which revolves, by clockwork, once in twenty-four hours; the paper is ruled with vertical lines representing time, and with horizontal lines representing the rate of flow in gallons per hour. It is therefore easy to determine at a glance what has been the rate of delivery at all times during the twenty-four hours, and also by computing the area of the space bounded by the pencil line, to determine the actual quantity in any given time. In a district demanding nothing but a purely domestic supply it is to be expected that the requirements from midnight to say 5 A.M. should be practically nil, while between 6 A.M. and 10 or 11 A.M. the maximum should be reached. If therefore, on examining the curve drawn on the paper, it appear that during the hours shortly after midnight the passage of water through the meter was but small and that the increased flow shown in the morning hours, and at the other hours when meals are being prepared, was relatively large, then it may be fairly assumed that all is in order. If, however, the paper reveal that in the hours closely following midnight there was a delivery so large that the increased quantity of the maximum hours formed but a small percentage of the quantity passing during the night hours, then it may safely be assumed that there is great waste going on. On this being observed the district is perambulated at night, and the socket spanner, with which the stopcocks external to the consumers' premises are worked, is applied to all the houses in succession, and is used as a stethoscope to ascertain by the sound whether or not water is flowing into the house; if it be heard to do so, the cock is shut, and the time is noted. This course is pursued throughout the district; very probably not more than five or ten per cent of the houses will have given evidence of waste; but on revisiting the meter it will be found that at the times corresponding with those in which the cocks were shut there was an instant decrease in the rate of flow, and that the whole rate has now fallen to that which is permissible during the night hours. On inspecting next day the houses which had been shut off, it will commonly be discovered that there was not any ball-tap to the cistern, or that there was a burst service-pipe across the courtyard below the surface, or that there was some other source of waste. That this is sheer waste, of no use to the occupier, is made clear by the consideration—that the delivery of water is going on in the dead of the night, when he is utterly unconscious of the fact, and although it goes on the whole twenty-four hours round, the occupier is, during his waking hours, equally unconscious of it, and makes no use of the water. If a slight house-waste only be going on, and the stopcocks be closed, and if it be found on returning to the meter that the heavy night flow is continuing, then the water authority must proceed at once to make an inspection of its own pipes, to find out where the leak is taking place. Thus the waste-water meter is of service to detect waste in the pipes external to the houses, to detect waste within the houses themselves, and also to show the quantity of water really *used* within the houses.

Not only does the waste of water involve extended outlay in the water-works, and the appropriation of gathering-ground which may be sorely needed by a neighbouring town, but it involves renewing the distributing system with larger mains to prevent the excessive loss of pressure which arises from the demand for increased quantities. This loss of pressure both precludes the possibility of playing a useful jet from a hydrant for the extinguishment of fires, and also prevents the water from rising to a reasonable height in the houses.

Where the water authority dare not (for fear of its constituents) establish and enforce proper regulations as to the nature of the fittings, and as to their condition and fair usage, the waste becomes something appalling. The Return (1891) of the Philadelphia Bureau of Water shows that 71 American gallons (equal say to 59 English gallons) were delivered in 1881 per head of the population per diem; but this quantity, excessive as it was, increased steadily year by year, and in 1890 was 132 American (110 English) gallons.

Some of those who look approvingly on the large delivery of water allege that at all events it is of benefit to the drains. This is a mistake; the water from a uniform leak of many gallons per hour has no power to act as a flush; but this large delivery of water has an effect on the sewerage, and one of a most disastrous character—viz. that the volume is so much increased as to materially add to the difficulty of disposing of the sewage either on land or by precipitation, while it also adds to the first cost and to the annual cost of pumping, where pumping is necessary.

When good supervision is exercised to prevent waste, from 16 to 20 gallons per head per day is all that is needed. Allowing for road-watering and drain-flushing, a fair estimate in a non-manufacturing town is, as already stated, 25 gallons per head per diem, even when taking baths into account, for with respect to these it must be remembered that some 20 per cent. of the population are of seven years of age or under, and that in their case the hip-bath or the tub is better than a large bath. Records have been kept which show that 2 gallons per head per diem is an outside allowance for potable and culinary water. The allowance on board ship to emigrants is fixed at 3 quarts per head per diem, and 10 gallons per mess of 100 for cooking, or in all less than one gallon per day per head. A very small surface would supply sufficient water—even with the rainfall of London—if all that fell on that surface could be collected, to prevent a man dying from thirst. A full-size umbrella, with an area of about 9 sq. feet, will do this. Taking the London rainfall at 25 inches, this makes $18\frac{3}{4}$ cubic feet, or 117 gallons = between $\frac{3}{100}$ and $\frac{1}{3}$ of a gallon per diem.

Selection of a Source.—When the average daily quantity of water needed, allowing for increase of population twenty to forty years ahead, has been determined, it then becomes necessary to see how it is to be obtained. If there be in the neighbourhood an adequate spring, or a river of satisfactory purity, the minimum daily flow of either of these is generally known, or can be approximately ascertained, and it will at once appear whether, taking into account other interests, the needed quantity can be drawn daily from the spring or from the stream. If, having regard to the geological character of the neighbourhood, it is deemed expedient the supply should be from deep wells, then there is generally evidence at hand as to the height at which the water stands at different seasons of the year and in different years in such wells, when pumping is not going on, and how much the level is lowered with different rates of pumping, and how far this pumping affects neighbouring wells. If the indications are satisfactory, trial borings are made, and the yield is tested. In some cases the supply afforded from one or more bore holes suffices; but frequently it is found necessary to sink a well, shutting out by means of cast-iron lining, or 'tubbing,' all surface-water, and when a sufficient depth is reached to drive adits—preferably at about right angles to the direction of flow of the underground water—so as to intersect the various fissures through which the water may be running. These adits may themselves be provided with bore holes.

There is a prevalent and mistaken notion that pumping from the chalk, in a chalk valley, in which there is a stream, must diminish, *pro tanto*, the quantity of water flowing in that stream. No doubt if the pumping were to take place at some point just above where the chalk spring gushes out to feed the river, this would be true; but, as a rule, the pumping does not take place in such a locality, but in situations where, when no pumping is going on, the water is many feet, not infrequently 60 feet, below the level of the water in the river. The fact that the water is at 60 feet below the river is proof that the abstraction of water at that point cannot influence the river; but what it does is this. It lowers the level of the water at the well, making a cone of depression for a certain distance round the well, and bringing to the surface and rendering useful that which otherwise would have passed away to the sea, invisibly and uselessly.

Where neither spring, river, nor well supply is available, and recourse must be had to gathering-grounds and impounding reservoirs, then arises the anxious question how near, and at what elevation can the needed area of gathering-ground be found? how much water will it yield during the year? are there many consecutive weeks or months during which the yield is but small? are there suitable sites for reservoirs and dams? and lastly, to what extent would the proposed works and abstraction of water interfere with existing interests? The difficulty of finding adequate and satisfactory gathering-grounds in the United Kingdom becomes more and more serious as suitable areas are taken up by one town after another. Mountainous or hilly gathering-grounds are, all other things being equal, to be preferred, because the rainfall is greater at high elevations, because the land is less suited for agricultural purposes, and because, even after allowing for the loss of head necessary to produce the flow through the conduit that extends from the reservoir to the town, the water can still be delivered into the service-reservoir at such an elevation as will supply the houses without pumping.

The engineer has also, in the United Kingdom, to allow for the water compensation to be given to the river fed by the gathering-ground. This compensation in the case of rivers in manufacturing districts is commonly fixed by parliament at $\frac{1}{3}$ of the whole water to be obtained by the works, leaving $\frac{2}{3}$ for the town; when the river passes through a mere rural district very much less compensation water is given. Whatever may be the quantity of the compensation water, it is always made a first (water) charge on the undertaking. This provision of storage and of compensation water is an advantage to the river, as by it heavy floods are prevented; and during those periods when for days or weeks together the natural flow of the river would be practically reduced to a mere rill, the compensation water affords a satisfactory and steady stream. Sometimes a separate reservoir is handed over to a committee of riparian proprietors, who regulate the outflow as they please. Sometimes the act prescribes that there shall be a continuous equable outflow day and night throughout the year; sometimes the compensation water must be given by an enlarged flow restricted to the working hours of working days; and sometimes the regular daily flow is reduced, so as to reserve water for periodical flushes of heavy delivery during the dry season. Bearing in mind the conjoined demands of the town and of the river, and knowing from rain-gauge observations the average rainfall on the gathering-ground, the engineer makes an allowance off this average for the diminution arising from three consecutive dry years; he next allows for loss by evaporation and absorption, and then treats the remainder as available for storage. Lastly he has to ascertain the irregularity from month to month in the rainfall, and he is then in a position to say how many days' storage the reservoirs should contain; these numbers of days vary very largely according to the character of the rainfall of the district.

Dams.—Having ascertained the extent of the storage needed, the hope of the engineer is that he may find among the hills on the course of the stream from the gathering-ground some valley not

too steep, and having a contraction at its lower end, across which may be built a dam which will pen up in the valley the needed quantity of water. In the United Kingdom these dams have commonly been made by earthen embankments having faces of a very gradual slope, especially gradual on the outside and containing in the centre a wall of puddled clay carried down below the ground surface into 'the puddled trench' sunk into the substratum until a solid water-tight bed is reached. Some of these banks have been made of great height, as much as 120 to 140 feet above the surface. Elsewhere masonry dams have been employed to a considerable extent—as at Vyrnwy (q.v.) for the supply of Liverpool. In this case a masonry dam of 100 feet above the ground-level and 60 feet below ground has formed a lake containing 11,000 millions of gallons.

Charge for Water.—For trade purposes this is commonly done by meter. Meters may be divided into two great classes, the Inferential and the Positive. A typical inferential meter is one where the current of water in passing through the meter causes the rotation of a vane (like that of a smoke-jack), and experiment having shown what relation the revolutions of the vane bear to the quantity passed in that experiment, it is *inferred* that at all rates of delivery the revolutions and the quantity will vary together. There should not be any harmful loss of pressure in passing through such a meter. A typical instance of a positive meter is one wherein the water fills a vessel of known capacity, and is then automatically turned into a second vessel, which it fills while the first one is being discharged. Such a meter, when properly constructed, is indeed a positive meter, but it is obvious that the pressure with which the water is delivered is destroyed, and that thus such a meter could not be placed in the cellar, for example, with the intention that the water which it had measured should be sent to the top story of the house, or indeed to any higher point. Another kind of positive meter is one wherein a piston is caused by the water to traverse in a cylinder, and to change its direction of motion when the cylinder is full, thus recording cylinderfuls of water. In such a construction, or in the numerous modifications of it, the pressure is for all practical purposes preserved. There are also positive rotary meters.

It has been commonly suggested that water for domestic purposes should be charged for according to the quantity actually consumed. On the Continent many towns have followed the example set by Berlin, which has gradually given an entire meter-supply; but in Berlin, owing to the flat system, there are on an average seventy occupants per house—i.e. per supply; while in London there are only on an average 7·39 per supply. In Berlin the landlord of the whole house is made liable for the water, there being one meter; thus only a tenth of the meters that would be required for an equivalent London population is needed. Further, the tenants, although they can draw as much water as they please, are very soon checked if they waste it, because the landlord has to pay for the whole, and he at once complains if the tenants' fittings are out of order or the water is otherwise wasted. On the other hand, many persons say that it is of such vital consequence to encourage the poor in habits of cleanliness that it is worth while to pay for water by means of a rate upon the value of the houses, although thereby the well-to-do man living in a fashionable neighbourhood pays a much larger amount per 1000 gallons than does the poor man. But it is no more illogical to charge by a percentage rate on annual value for bringing water to a house than it is to charge in that manner for the use of the sewers taking the water away.

Other plans of charging have been proposed or are in use, such as payment by a rate upon the value of the house plus the employment of a meter, the rate payment on the value covering the supply of a certain number of 1000 of gallons per quarter without further cost to the consumer; but should this number of gallons (which varies according to the annual value) be exceeded, then a 'quantity' charge is made for that which is used in excess. In some cases, where the municipality is the water authority, there is a rate upon the properties using the water plus a general rate upon all properties whether they use the water or not; it being held that warehouses and other properties—even if no water be consumed there—benefit by the water-supply as regards safety from fire. There is another system of water-supply now largely extended in London—viz. that of high-pressure water (at 700 lb. to the square inch) provided for the purposes of hydraulic lifts, and for other motors, in establishments needing for brief periods considerable motive power.

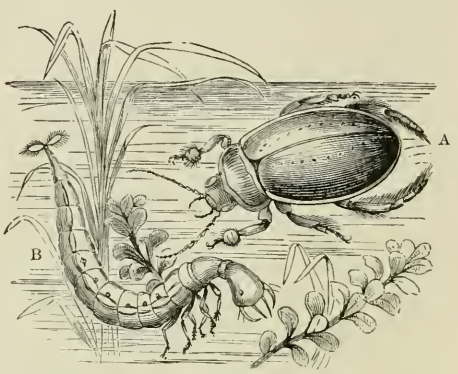
The London water-supply has for some half a century been in the hands of eight companies—the Chelsea, the East London, the Grand Junction, the New River, and the West Middlesex supplying the town north of the river; the Kent, the Lambeth, and the Southwark & Vauxhall supplying the south side. The Chelsea, the Grand Junction, the Lambeth, the Southwark & Vauxhall, and the West Middlesex derive their supply practically entirely from the Thames, although some of them obtain a portion of this supply from wells and springs. The intakes of these companies are, none of them, lower than Hampton. The East London also procures a very small portion of its supply from the Thames at Sunbury, the remainder, and by far the principal part, being derived from the river Lea, or from the chalk wells in the Lea valley. The New River, as originally planned by Sir Hugh Myddelton (the London goldsmith), still brings the waters of the Chadwell, Amwell, and other springs from Hertfordshire to London; but the increased quantity now given by this company is obtained from the river Lea itself, near to the Chadwell spring, and from the chalk wells in the Lea valley. The Kent Company derives its supply entirely from chalk wells.

Sea-water may be rendered drinkable by being filtered through 15 feet of fresh dry sand; but at sea it must be distilled. The distilled water, however, has no air dissolved in it, and is unpalatable; and it has a nauseous odour and taste derived from the decomposition of organic matter in the sea-water. The addition of chemical reagents is objectionable; aeration of a large quantity of water is a slow process, and the air taken up may be of bad quality, as in the hold of a ship. In Dr Normandy's apparatus there is an evaporator in which sea-water is boiled by superheated steam in steam-pipes; the vapour is being cooled down in a condenser. The cooling water in the condenser as it is itself warmed loses its dissolved air; this air is led round and mixed with the steam which is being condensed, and the condensate is fully aerated.

The water-supply of great cities and towns is usually treated of in the articles on those towns (as in those on Bombay, Chicago, Glasgow, Liverpool, Manchester, New York, &c.). See also the articles Bacteria, Canal, Ceylon, Filter, Germ, Hygiene, India (p. 113), Irrigation, Rain, River, Sewage, Sheffield, Tansa; works by Hughes (1867; new ed. 1882), Humber (1876), Ansted (1878), De Rance (1882), Bolton (1884; new ed. 1888), Silverthorne (1888), Slagg (1838), Turner and Brightmore (1893), W. K. Burton (1894); for Canada, Egypt, India, &c., Jackson (1886; new ed. 1889) and Stone (1889); for the United States, Fanning (1877; new ed. 1882), Nichols (1883), and Wegmann (1896).

Water-beds, a valuable contrivance for the comfort of the sick, especially for minimising the risk of Bed-sores (q.v.). They are somewhat similar to Air-beds (q.v.), but, while more costly, are more serviceable and durable. The water-bed is laid on an ordinary bedstead, either upon or in place of the mattress, and filled with warm water to the proper degree; it must not be so full that it will not yield readily under the body of the patient. Clothes, pillows, &c. are then laid on it, as on a common bed, and the patient transferred to it.

Water-beetles, beetles which live on or in the water, especially the somewhat similar Amphizoideæ, Haliplidæ, Dytiscidæ, and Gyrinidæ, and also the quite different clavicorn Hydrophilidæ. The Dytiscus, common in stagnant water, is olive-green above, and oval in shape. The respiratory



A, *Dytiscus marginalis*, or Great Water-beetle; B, larva.

organs of the perfect insect are not adapted to obtaining air from the water; the creature must therefore come occasionally for air to the surface of the water, where it lies on its back, the openings of its air-tubes, which are in the last segment of the abdomen, being exposed.

Water-boatman. See Boat-fly.

Water Brash. See Indigestion.

Water-bug, the popular name of a tribe of insects (Hydrocorisæ) in the order Rhynchota. They live almost entirely in water, and feed upon other aquatic insects. One of their most distinctive characteristics is the shortness of the antennæ which lie concealed in pits near the eyes. As representatives of the tribe may be noted the Water-boatman (Notonecta), whose long hinder legs are thrown out like sculls, and the Water-scorpions (Nepa and Ranatra), with fore-legs adapted for seizing prey, and with a pair of terminal tail-like organs which form an air-tube.

Waterbury, a city of Connecticut, 33 miles by rail SW. of Hartford, on the Naugatuck River. It has a fine central park, with the city hall and St John's Episcopal church (spire 200 feet) opposite, and is a busy manufacturing place. It is most important for its brass wares, but it is its cheap watches that have carried its name round the world. Pop. (1880) 17,806; (1890) 28,646.

Water Caltrop. See Trapa.

Water Chestnut (*Marron d'Eau*), the name given in France to the edible seeds of the *Trapa natans* (see Trapa). The name water chestnut is also given to the edible tubers of the *Scirpus tuberosus*, a plant of the natural order Cyperaceæ (q.v., and see Bulrush), which is cultivated by the Chinese in tanks very abundantly supplied with manure. It is destitute of leaves, except a slender short sheath or two at the base of each culm. It is stoloniferous, and the tubers are produced on the stolons. They are in high estimation among the Chinese, both for food and as a medicine, and are eaten either raw or boiled.

Water-clock. See Clepsydra.

Water-closet. See Sewage.

Water-colours are pigments prepared for the use of artists and others by mixing colouring substances in the state of fine powder with a soluble gum such as gum-arabic. These are made up in the form of small cakes, which are rubbed down with water and applied with a brush to paper, ivory, and some other materials. Moist water-colours are made up with honey or glycerine as well as gum, and are prepared so as to be kept in small earthenware pans or metallic tubes. Dry cakes require to be rubbed down with water on a glazed earthenware palette or slab, but moist colours can be mixed with water for use by the friction of a brush, so that the japanned lid of the box which contains them serves for a palette. The latter are accordingly very convenient for sketching from nature. The most important water-colour pigments are noticed under various heads which are given in the article Pigments.

In water-colour painting two methods are employed; by one the artist works in transparent colours, by the other in opaque or body colours. In working by the latter method, which somewhat resembles oil-painting in its nature, Chinese white (see White Pigments) is mixed with light colours to give them body. Not only is there much artistic work done solely in transparent colours, but it is almost always these that are used for tinting mechanical drawings, maps, and the like. Some artists freely combine transparent, semi-transparent, and opaque colours. The quick drying of the water-colour pigments is favourable to rapid execution; and greater clearness is attained than is practicable in oils. In water-colour painting the texture of the paper employed is often of importance. Water-colour drawings are of course more easily injured by damp than oil-paintings.

Water-colour Painting, the most delicate of the graphic arts, is in an especial sense an English art. It was in England first that it attained to the dignity of a recognised artistic pursuit, and came to be—what it now is—admittedly the rival of oil-painting in brilliancy and power. It has had a large share in the modern prosperity of the fine arts, and of late has been practised by eminent artists in various countries, as France, Germany, and Austria.

In the illumination of missals water-colours were used mixed with the body white; and the same is true of the miniature-painting of the 18th century. Frescoes and painting in tempera were also in a sense works in water-colour. But the art of water-colour, as we now understand the term, had its origin in quite a different way. Dürer and certain of the German, Flemish, and Dutch artists were accustomed to outline drawings with a reed pen, and fill in those outlines with an auxiliary flat wash. Gradually the hard lines were replaced by touches with the brush, and the result was a monochrome in browns and grays, bistre or Indian ink. These again came to be tinted, and so suggested the full use of colours. Rembrandt often drew in brown, and added dashes of strong colour; and Rubens produced something very like modern water-colour drawings.

The modern art became emancipated from the old traditions by 'gradual disuse of the general shadow tint, and imitation of the local colour, not alone of the objects themselves, but of every modification resulting from light, dark, half-tint, or distance, a method which at once led to far greater

truth and richness than could ever have been attained by merely passing colour over the universal shadow tint.' The stained drawing gradually gave way to the more perfect tinted drawing. But the tinted style predominated till 1790; and it may be said that the water-colours of the 18th century were tinted monochromes. It was in the 19th century that Girtin and Turner showed what scope and power there were in the art.

Artists who used the stained and tinted manner were Malton (1726–1801), Paul Sandby, R.A. (1725–1809), often called, though without justification, 'the father of water-colour art;' also, all in the last half of the 18th century, Grimm, Webber, Clevely, Pars, and Rooker. Wheatley, Westall, and Gilpin used water-colour as well as oil. Rowlandson, Cristall, Hills, Wright, Mortimer, Gresse, Hearne, J. R. Cozens, and Dayes greatly promoted the growing art. Nicholas Pocock (1749–1831) displayed a new richness and force. John Smith (Warwick Smith) first got beyond the weakness of mere tinting. Thomas Girtin (1775–1802) attained great richness of tone and breadth; his compositions were grand but simple; he massed light and shade in broad and sometimes abrupt forms. J. M. W. Turner (q.v.; 1775–1851) soon distanced all his predecessors and contemporaries, and in his hands water-colour painting became a new art. He wholly abandoned preliminary tinting; minute details are imitated in local colour; his work is marked by breadth, fullness, warmth as well as grace. Other more or less important names are those of Delamotte, Varley, J. J. Chalon, A. E. Chalon, Samuel Prout, Peter de Wint, Liverseege, Cotman, David Cox, Essex, Richardson, Newton, Bonington, Copley Fielding, Robson, W. Hunt, Ross, Harding, Cattermole, Holland, Penley, Lewis, Houghton, and Pinwell; more recent are Birket Foster, Sir John Gilbert, &c.

The Society of Painters in Water-colours was instituted in 1804; it held its first exhibition in 1805; and its annual exhibitions are now as crowded as those of the Royal Academy. Formal recognition of its dignity was accorded in 1882, when the society obtained a charter, and became the Royal Society of Painters in Water-colours. There are other similar associations, as the Institute of Painters in Water-colours. An admirable collection illustrative of the history of the art may be studied in the South Kensington Museum.

For the history of water-colour painting, see the article PAINTING (p. 698); Redgrave's Introduction to the Catalogue of Water-colours at South Kensington (1877), and his son's *Water-colour Painting in England* (1892); Hamerton's *Graphic Arts* (1882); Cosmo Monkhouse, *The Early English Water-colour Painters* (1889); and J. L. Roget, *History of the 'Old Water-colour' Society* (2 vo's. 1891).

Water-cress. See CRESS.

Water-cure. See HYDROPATHY, BATH.

Water-deer, a name given to a small Chinese Musk-deer (q.v.) of aquatic habits; also in Africa to one of the Chevrotains (q.v.). The water-buck, formerly common in South Africa, was an antelope (*Kobus ellipsiprymnus*) much given to being about the edge of lakes and rivers, and with exceptional powers of swimming.

Water-dropwort (*Œnanthe*), a genus of plants of the natural order Umbelliferæ; having ovato-cylindrical fruit, not prickly nor beaked, each carpel with five blunt convex ribs, and single vittæ in the interstices; the calyx teeth lanceolate; the petals obcordate and radiant, with an inflected point; the partial involucre of many rays; the flowers of the circumference on long stalks and sterile, those of the centre subsessile and fertile. A number of species are natives of Britain, large perennial plants, with a strong and generally disagreeable aromatic smell, and compound or decompound leaves. The Common Water-dropwort (*Œ. fistulosa*) and the Hemlock Water-dropwort, or Water Hemlock (*Œ. crocata*), are both common in wet places in Britain and throughout Europe, and both are narcotic acrid poisons. The roots of the latter have some resemblance to small parsnips, and hence fatal accidents have frequently occurred. The Fine-leaved Water-dropwort, called Water Fennel by the Germans (*Œ. phellandrium*, formerly known as *Phellandrium aquaticum*), is also common in ditches and ponds both in Britain and on the Continent. It has a jointed root-stock (*rhizome*), with tufted whorled fibres, and a strong zigzag stem dilated at the base. It is not so poisonous as the other species just named. It was at one time erroneously regarded as a specific against pulmonary consumption; but it has been advantageously employed in pulmonary complaints.

Hemlock Water-dropwort (*Œnanthe crocata*).

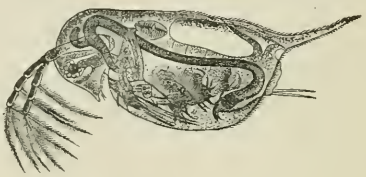
Water-engine. See WATER-POWER.

Waterfalls occur most frequently in mountainous countries, where the streams from the mountain sides enter the valleys. It is only when the side of the valley is composed of hard rock that there can be a waterfall; in friable strata the stream wears out a ravine or side-valley. These mountain waterfalls, however, are generally rather curious and picturesque than grand, the volume of water being in most cases comparatively insignificant, though the height of fall is occasionally very great. All mountain waterfalls necessarily change their aspect from season to season—in winter a roaring torrent plunging headlong into the abyss, in summer often a mere film of water trickling down the face of the precipice. Waterfalls in comparatively level districts are not nearly so common, and their height of fall is insignificant compared with that of mountain cataracts; but the much greater volume of water, and its steady and even flow to the head of the precipice over which, in solid column, it descends with a thundering plunge place such waterfalls among the grandest of nature's phenomena. It is where the course of a large river passes from a higher to a lower plateau, and where the upper plateau is edged with rock, that the grander cataracts are formed. If the rocks are of the same hardness from top to bottom, the edge of the escarpment, supposing it to be perpendicular at first, becomes worn off, and a slope or *rapid* is formed. But when the upper edge is hard and the under strata soft and friable, the reverberation of the spray wears away the softer parts below, leaving a projecting ledge at the top, which breaks off, piece by piece, as it becomes too much undermined, so that the fall is constantly receding. For the utilisation of waterfalls to generate electrical energy, see TRANSMISSION OF POWER. The cataracts of the Velino and Anio, in Italy, are

beautiful artificial imitations. The most important waterfalls are discussed under their own names, the river on whose course they occur, or the districts to which they belong. Among them are :

Yosemite (3 plunges)	2660 feet.
Roraima Fall, Guiana (2 plunges)	2000 "
Grand Falls, Labrador	2000 "
Sutherland Falls, New Zealand (3 plunges)	1904 "
Kukenam Fall, Guiana (sheer plunge)	1500 "
Gavarnie Fall, Pyrenees	1380 "
Staubbach	866 "
Kaieteur Falls, Guiana	740 "
Tequendama Falls, near Bogotá	625 "
Victoria Falls, Zambesi	400 "
Rio Iguassû, southern Brazil	215 "
Shoshone	210 "
Foyers, highest in Britain (2 plunges)	205 "
Hay River, Alaska	200 "
Niagara	160 "

Water-flea, a popular name for minute aquatic Crustaceans such as Daphnia among Cladocera, Cypris among Ostracoda, and Cyclops among Copepoda. The common *Daphnia pulex*, abundant in fresh water, is a good representative. The body is enclosed in a bivalve shell; there is a large single eye; a pair of large antennæ are used as swimming organs. The Daphnids are marvellously prolific, and for prolonged periods parthenogenetic. There is an interesting difference between the winter eggs which require fertilisation and the summer eggs



Water-flea (*Daphnia similis*).

which do not. The females have a dorsal brood-chamber between the shell and the back. Of related genera Sida, Moina, Lynceus, Polyphemus, and Leptodora may be noted. In Cypris also the shell is bivalve; there are five pairs of appendages on the head and two on the body; most of these are used in swimming or creeping. Related to Cypris but living in the sea are Cythere, Halocypris, Cypridina, &c. Among Cyprids parthenogenesis again occurs, and in some species males have never been observed, while parthenogenetic development has been traced for as many as forty successive generations. The females bear large egg-sacs. In Cyclops the body is more distinctly segmented and the shell is not bivalve; the head bears antennæ, mandibles, and maxillæ, and the first five segments of the thorax bear swimming appendages. Resembling Cyclops and also a fresh-water form is Canthocamptus, while Cetochilus and Clauso-calanus represent numerous marine Copepods. Water-fleas feed on microscopic plants and animals and on organic debris, while they themselves —often occurring in countless swarms—form an important part of the food-supply of certain fishes.

Waterford, an Irish county in the province of Munster, to the east of Cork. Its greatest length from east to west is 52 miles, and its breadth north to south 28; the total area being 721 sq. m., or 461,552 acres. The surface is in general mountainous, the principal ranges being Knockmeledown (2609 feet) and Cummeragh (2478). The Suir (q.v.) and the Blackwater (q.v.) are the chief rivers. The climate is moist, and the soil over a considerable part of the county is marshy; but the upland districts are well suited for tillage, and the lower pasture-lands produce excellent butter. In geological structure the mountains present the old and new slate, separated by red and gray quartz rock and quartzose slate. The valleys belong to the limestone series. Lead, iron, and copper are found, the latter having been worked at Knockmahon for many years. Marble of several colours is quarried near Cappoquin and Whitechurch, and potter's clay of good quality is found at Kildrum near Dungarvan. There are some cotton manufactures, and the fisheries are of some importance. The chief towns are Waterford, Dungarvan, Tramore, Portlaw, and Lismore. Before 1885 the county and the boroughs sent five members to parliament; now the county sends two and Waterford city one. Pop. (1841) 196,187; (1861) 134,252; (1881) 112,768; (1891) 98,130. This district, in common with the adjoining county of Wexford, is believed to have been anciently peopled by a Belgic colony. The Danes also formed a settlement at the mouth of the Suir. From the date of the invasion Waterford became a stronghold of the English, large grants having been made by Henry II. to the De la Poers; and in all the alternations of the subsequent struggle with the Irish population it continued for the most part a firm centre of English influence. The county abounds with ecclesiastical and military antiquities of the Celtic and Danish as well as the Anglo-Norman period.

WATERFORD, the county town, but itself a county of a city and a municipal and parliamentary borough, is on the river Suir, at the head of the tidal estuary, Waterford Harbour, 97 miles SSW. of Dublin by rail. The city, with the exception of its suburb of Ferrybank, with which it is connected by a wooden bridge of thirty-nine arches, lies on the right bank of the Suir, along which a handsome and spacious quay extends for a distance of nearly a mile, and from which the city ascends gradually in well-built streets. Vessels of 2000 tons can now discharge their cargoes at the quay; but the place has not a thriving look. The chief public buildings are the Protestant and Roman Catholic cathedrals, the Protestant episcopal palace, the (Catholic) college of St John, the city and county court-houses, besides hospitals, &c. The chief trade is with England in the export of butter, pork, bacon, corn, flour, eggs, and live-stock. There is a shipbuilding-yard, with patent slip, graving-bank, and dock on the Kilkenny bank of the river. Waterford is originally of Danish foundation, but in 1171 the city was taken by assault by Strongbow, by whom it was enlarged and made a place of strength. It received a charter from John, which was forfeited under James I., but restored by Charles I. in 1626. But few remains of its ancient buildings are now to be seen. Pop. (1881) 22,457; (1891) 21,693; and of parliamentary borough, 27,623 (of whom 25,418 were Catholics). See Ryland's *History of the County and City of Waterford* (1824).

Waterford, LOUISA, MARCHIONESS OF (1818–91), was ranked by G. F. Watts as one of the greatest real artists of our time in virtue of her pictures ('Spring,' 'Christmas,' 'The Miracle of Healing the Two Blind Men') at Ford Castle, Northumberland, and her book-illustrations. She was the daughter of Lord Stuart de Rothesay, and widow of the third Marquis of Waterford. Nearly 350 of her drawings were exhibited in 1892. See A. J. C. Hare, *Two Noble Lives* (1893).

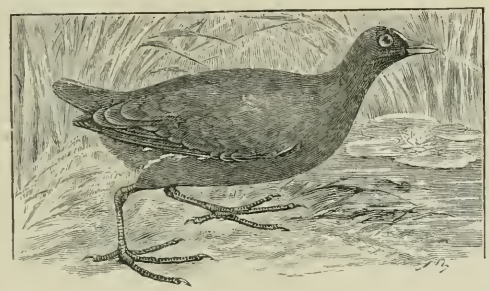
Water-glass, or SOLUBLE GLASS. See GLASS, Vol. V. p. 245.

Water-hemlock. See HEMLOCK.

Water-hen, or MOOR-HEN (*Gallinula chloropus*), one of the rails (Rallidæ), resident and widely distributed in Britain. It occurs throughout Europe, except in northern parts, and from North Africa to Cape Colony, from Ceylon and the

Philippines to Japan and Lake Baikal in Siberia. It is represented by closely allied forms—*G. galatea* and *G. tenebrosa*—in America and Australia respectively. It lives by ponds and streams, makes its nest of matted reeds and sedges generally among the thick vegetation near the water's edge, begins to breed before the winter is well over, and produces two or even three broods in the season. The (seven to nine) eggs are buffish-white speckled with reddish-brown; 'the young from the first nest assist their parents in building another, and even in taking care of the second brood.' The food generally consists of slugs, worms, grass, grain, and insects, but the bird will also devour the young of other water-fowl. 'The call-note is a loud *crek-rek-rek*, several times repeated, especially towards evening.' In length the bird measures about a foot; the predominant colours are dark



Water-hen (*Gallinula chloropus*).

olive-brown and dark slate-gray, but there are white streaks on the flanks, and the under tail-coverts are white. See Howard Saunders, *Manual of British Birds*.

Water-hog. See WART-HOG.

Water-horehound. See GYPSY-WORT.

Waterhouse, ALFRED, architect, was born at Liverpool, 19th July 1830, studied at Manchester, and became A.R.A. in 1878, R.A. in 1885, and a member of the Berlin Academy of Arts in 1890. Among his works are the Manchester town-hall and assize courts, Owens College, Girton College, the new Natural History Museum at South Kensington, several London clubs, the new St Paul's Schools, besides mansions throughout the country.

Water in the Head. See HYDROCEPHALUS.

Waterland, DANIEL, divine, was born at Waseley rectory in Lincolnshire, February 14, 1683. He studied at Magdalen College, Cambridge, became fellow in 1704, and by 1727 canon of Windsor, in 1730 archdeacon of Middlesex and vicar of Twickenham. Waterland was a stout controversialist, and defended the faith that was in him with great vigour against Samuel Clarke, Daniel Whitby, and many more. Indeed he was thought in his day to have proved the fact of Christ's divinity. He died 23d December 1740.

His best books are the two *Vindications* of Christ's divinity (1719–23), and the *Further Defence* (1725), *A Critical History of the Athanasian Creed* (1724), *A Review of the Doctrine of the Eucharist* (1737), and *Scripture Vindicated* (1734), in answer to Tindal. There is a complete edition of his works, with Memoir, by Bishop Van Mildert (Oxford, 11 vols. 1823–28).

Water-lily, a name commonly given to the different species of Nymphæa and Nuphar, and also of Nelumbium, all genera of the natural order Nymphæaceæ (q.v.), and indeed often extended to all the plants of that order. Britain produces three species—*Nymphæa alba*, the White Water-lily, and *Nuphar luteum* and *Nuphar pumilum*, called Yellow Water-lilies. The two former are frequent in still waters in most parts of

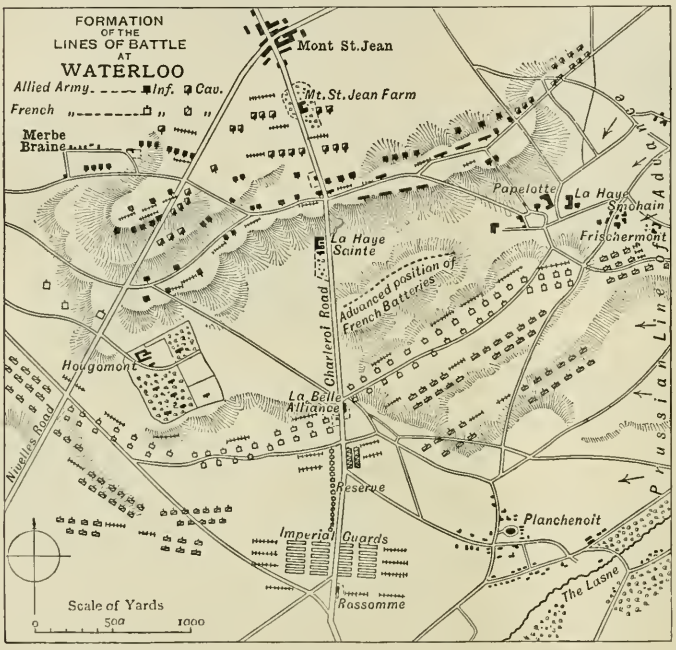
White Water-lily (*Nymphæa alba*).

the island; *Nuphar pumilum* is more rare, and chiefly found in Scotland. All have heart-shaped leaves, floating on the water. The beautiful and fragrant white flowers of *Nymphæa alba* float upon the water during the day, but collapse and droop upon or sink below its surface during the night, rising and expanding again in the morning. The flowers of the yellow water-lily, which are of comparatively little beauty, are raised by their stalks a little above it. The seeds of these, as well as of the Water-lily of the Nile (*Nymphæa lotus*; see LOTUS), are farinaceous, and are sometimes used for food. The root-stocks of *Nymphæa alba* contain a large amount of gallic acid, and have been used in dyeing. Numerous species of tropical and subtropical Nymphæa are cultivated in British aquaria for their beautiful and fragrant flowers. The Sweet-scented Water-lily of North America (*Nymphæa odorata*) has a large white flower of great beauty, and of very sweet smell. Not only *N. lotus*, but also *N. rubra* and *N. pubescens*, are sacred plants to the Hindus. *N. cærulea* was held sacred by the ancient Egyptians.

Waterloo, a village or small town (pop. 3600), 11 miles S. of Brussels, which has given its name to the decisive battle fought near it on Sunday, 18th June 1815. On that day Wellington had collected 50,000 infantry, 12,400 cavalry, and 156 guns on the low ridge, some 3 miles long, which bestrides the Charleroi road near Mont St Jean. Of these troops only one-third were British, and many raw recruits; of the others a large proportion being Dutch-Belgians were disaffected and sympathised with the French. Along the main ridge, which was not entrenched, twenty battalions, some 15,000 men, were deployed in front line, and twenty battalions stood in second line under cover of its reverse slope. Some 14,000 men were in reserve in two groups, and 6000 in advance occupying the important posts of Hougomont (1200), La Haye Sainte, Papelotte, La Haye, and Smohain. The cavalry brigades were posted on the left flank and behind the centre and right, two at each place; 4000 horsemen being held in reserve. One-third of the guns were in action in front of the deployed line, one-third in support behind the right and centre, and the remainder in reserve. The right was strong so long as Hougomont held out; the left was weak in comparison, but the Prussians were approaching that flank from Wavre. On the right of the ridge was a steep ravine, whilst its left merged into a plateau. The front slope was gentle, continuous, and unobstructed, except by the farm enclosures, rising to

an opposite ridge of the same character on which was deployed the French army, some 61,000 of all arms, under Napoleon. Its disposition was as follows: in front were 31,000 infantry, in two lines of battalion columns at deploying intervals. On each flank was a brigade of cavalry (1700 sabres); close in rear of the centre a reserve of the three arms, 10,000 strong; and behind it the main reserve, 11,000 strong, composed of the Imperial Guard. Two large bodies of cavalry, each about 2600 sabres, were also posted behind the main infantry line. Of the 246 guns 84 were pushed down the slope in front of the infantry, 96 were held in reserve, and the remainder formed local reserves with the cavalry behind the right and left centre.

The quality of the French troops was excellent; there were none that had not already made one or more campaigns, they were all of the same nation,



Note.—The Village of Waterloo is about a mile north of Mont St Jean.

and commanded by one in whose genius they had unbounded confidence. The opening of the campaign, too, seemed to justify their confidence. Two days before, under his command, they had defeated the Prussians at Ligny, and seen Wellington retire from Quatre Bras. Now 33,000 men and 96 guns, under Grouchy, were pressing the former, who, having no magazines west of Namur, might be expected to retire eastward on that place; while the latter, fearful for his communications westward, through Ghent to Ostend, offered battle with troops about equal in numbers but infinitely inferior to those of France.

The heavy rain that had been falling for many hours ceased at 4 A.M. on the 18th, but Napoleon did not attack until 11.30, owing, as he asserts, to the statement of his artillery officers that guns could not move until the ground had dried a little—a very inadequate reason for such a fatal loss of time. He occupied the interval with an ostentatious review of his army. The battle commenced with a violent cannonade all along the line. Then three divisions of Reille's infantry, on the west of the Charleroi road, preceded by clouds of skirmishers, attacked the homestead of Hougomont, and after a severe struggle gained the road south of the château, but were brought to a standstill by the loopholed garden-wall. The orchard east of the garden was temporarily occupied, but attempts to get into the farm-buildings failed, and reinforcements from the British right then drove them beyond the southern garden-wall with heavy loss. The struggle was constantly renewed throughout the day, but the defenders held the farm and out-buildings to the last.

Meanwhile the guns on both sides kept up a continuous fire, and to prepare for an attack against the British centre Napoleon advanced seventy-four to a lower ridge only some 600 yards from it. The movement was delayed owing to the presence of troops to the eastward being signalled, and cavalry were sent to ascertain who they were. But at 1.30 the French infantry on the east of the Charleroi road advanced in dense columns flanked by cavalry—in all about 25,000 men, chiefly from D'Erlon's corps. The flank brigades first came into contact, and at 2 o'clock the British were expelled from the orchard of La Haye Sainte, but not from the buildings, while an indecisive action raged at Papelotte and Smohain. Simultaneously a charge of French cuirassiers swept down parallel to and west of the Charleroi road, scattered some Hanoverian troops, and passed between the hastily formed British squares, within which the gunners of the advanced batteries took refuge. A Belgian brigade taking to flight left Picton's weak division to withstand, unsupported, the attack of the heavy French columns. The moment was critical, as no infantry reserves were at hand, and the two brigades of heavy cavalry were therefore ordered to charge. One, the Household brigade, overthrew the French cuirassiers, cleared the space in rear of La Haye, and pursued to the west of the Charleroi road for some distance; the other, Ponsonby's, attacked the French infantry columns, and drove them back in disorder. Sweeping onwards, these three regiments reached the advanced French batteries, but were then taken in flank by French cavalry, and retreated with great loss under cover of the charge of their own light cavalry from the left wing. It was now nearly 4 o'clock, and determined but unsuccessful efforts had been unceasingly made by the French to gain possession of Hougomont and La Haye. Between that hour and 6 P.M. four great cavalry attacks were then delivered against the British right centre. Some 4400 horsemen rode in the first, and nearly twice that number in the third. The British squares stood firm against these attacks, but suffered great loss from the enemy's artillery and skirmishers whilst in this dense formation.

These impetuous onslaughts were, however, the desperate efforts of a commander who felt that he must sweep away the enemy in his front or perish, for at 4.30 part of Bülow's corps of Blücher's army appeared upon the field, and by six o'clock 29,000 men and 64 guns were pushing forward against the French right and rear. Blücher, with a loyal disregard to the possible disaster that might result to himself from such a course, had readily agreed to support Wellington with his whole army instead of

retiring towards his base. His leading troops were indeed within 8 miles of Wellington's left at the time when Napoleon assumed them to be retiring before Grouchy towards Namur. The country separating the allies was little suited to the rapid march of large bodies of men. The deep and miry cross-roads had become almost impassable owing to the heavy rain. The men had been drenched and tired out on the 17th. A fire in Wavre hindered their passage through that town, and defective arrangements, causing two columns to cross on their march, still further delayed the general advance. A start could not be made until 7 A.M., and the rate of marching did not exceed 1 mile an hour. Grouchy, too, having ascertained the true direction of their march, was now pressing on their rear, and had to be held back. The rain, which Napoleon says prevented him attacking in the early morning, was therefore also responsible for many of the long hours during which Wellington had to bear unaided the full brunt of his attacks, and, but for Blücher's dogged resolution and his influence upon his men, might have prevented altogether that junction of the allies which they had designed on the night of the 17th, and to achieve which Wellington stood fast at Mont St Jean.

The Prussian corps advanced on a wide front, their left being directed on Planchenoit. To oppose them Napoleon (when assured of their approach by the capture of an orderly carrying despatches from Bülow at 1 P.M.) had detached 10,000 of the Young Guard under Lobau, as well as the cavalry (2400 sabres) already reconnoitring in that direction. He also wrote to Grouchy hoping that he was near enough to take Bülow in flank, but that officer was thoroughly committed to a severe action at Wavre, where Napoleon's letter reached him at 6 or 7 P.M.

Trusting that he could thus hold Bülow in check, Napoleon then continued his efforts against the British, whose front line had been somewhat altered by bringing forward two batteries and two brigades from the reserve. The latter deployed in a four-deep line extending from the north-east corner of the Hougomont enclosure to the main ridge. Soon after 6 P.M. Ney was entrusted with a fourth attack upon La Haye Sainte, and succeeded in gaining possession of the farm-buildings. At the same time and up to 7.30 the attack was pressed near the Charleroi road. Clouds of skirmishers and artillery fire repeatedly caused the allied battalions to deploy and advance down the ridge, when masses of French cavalry suddenly attacked and obliged them to form squares and so present vulnerable targets to the guns and sharpshooters.

But severe fighting was now going on for the possession of Planchenoit, and over 50,000 Prussians were engaged. At 7.30 Napoleon determined on one more attempt to crush the adversary in his front. The Imperial Guard advanced in two columns between Hougomont and La Haye Sainte. That on the right, consisting of four battalions, moved first, and, unchecked by artillery fire, gained the summit of the ridge. The British Guards, who were there lying down in a line four-deep, sprang to their feet at Wellington's command, fired a volley and charged. Shattered by this enveloping fire, the heavy French column fell back in confusion. Ten minutes later the left column, six battalions, followed from the south-east corner of Hougomont against the same part of the British line. Adam's light brigade, on the right of the Guards, thereupon wheeled forward its right one-eighth of a circle, fired into their flanks and then charged. The Guards crushed with their fire the head of the column, and its rout was complete. A general advance of the whole British line then took place, and the battle was won.

In the meantime the Prussians drove the French in confusion from Papelotte, which they had won, on La Belle Alliance, thus exposing Lobau's left. His troops, assailed at the same time in front, then gave way, and after an obstinate resistance Planchenoit was wrested from them. This success laid open the main line of retreat to the fire of the Prussian guns, which now almost crossed the British front and turned the defeat into the most disastrous rout of a great army which history records. The allied cavalry pressed on in their eagerness so hastily as to exchange sabre cuts in the coming darkness. The losses were great in proportion to the numbers engaged: allies, 22,500, of whom 7000 were Prussians; and French (including prisoners), 32,000. The result was the deposition of Napoleon and his exile to St Helena.

The best and fullest book on the subject is unquestionably *The Campaign of Waterloo: a Military History* (1893), by the American author John Codman Ropes, where references to the rather extensive literature of the subject will be found; a recent popular work is that by Horsburgh (1895). Before entering upon a study of the campaign the *Waterloo Lectures*, by Lieutenant-colonel C. C. Chesney, R.E., should certainly be read, referring as they do to all the best sources of information, such as the works of Charras, Thiers, Brialmont, Siborne, Shaw-Kennedy, Gurwood, Dorsey Gardner, Hooper, &c., and critically examining the many discrepancies which they present. See also the article NAPOLEON. It should be added that the French named the battle from Mont St Jean, and the Prussians from Belle Alliance; but the name Waterloo is now commonly used in France and Germany as well as in Britain. The mound surmounted by the Belgian lion is conspicuous on the field.

Waterloo. capital of Black Hawk county, Iowa, on both sides of the Cedar River, 93 miles by rail W. of Dubuque, with mills, foundries, and furniture and other factories. Pop. 6674.

Water-soldier (*Stratiotes aloides*), a plant belonging to a genus of the natural order Hydrocharideæ, is common in lakes and ditches in the east of England. It is a singular plant with numerous leaves, which are strap-shaped and spring from the root, from which also springs the two-edged flower-stem, bearing the spathe with beautiful and delicate white flowers. In autumn the whole plant disappears, the root alone remaining at the bottom of the water, from which a number of young plants arise in spring, filling up ditches, so that nothing else can grow in them. The water-soldier is a very ornamental aquatic plant.

Waterton, CHARLES, naturalist, born at Walton Hall near Wakefield, 12th June 1782. Of Catholic parentage, he was educated at Stonyhurst, and, devoting himself to researches in natural history, spent the years 1812–23 in America, publishing on his return his most interesting and successful *Wanderings in South America* (1825; 6th ed. 1866; and often since re-edited by J. G. Wood and others). His *Natural History Essays* appeared in three series, 1838–57; and a new ed., with Life of the author by Moore, was issued in 1879. Waterton, who was rather a keen observer and racy writer than a scientist of the new school, died 27th May 1865.

Watertown, (1) a town of Massachusetts, on the Charles River, 8 miles W. of Boston, with a national arsenal and manufactories of stoves, woollens, paper, stockings, and cardigan jackets. Pop. 7038.—(2) Capital of Jefferson county, New York, on Black River, 12 miles by rail E. of Sackett's Harbour on Lake Ontario. The rapids supply power for numerous factories turning out spring-wagons, sewing-machines, farming implements, flour, paper, woollens, &c. Pop. 14,725.—(3) A city of Wisconsin, on both sides of Rock River, 44 miles by rail W. by N. of Milwaukee, with manufactories of flour, beer, chairs, blinds, &c. Here is the North-western University (Lutheran; 1864). Pop. 8755.

Waterville, a village of Maine, on the Kennebec (navigable to this point by a dam and locks at Augusta), at Ticonic Falls (18 feet), 19 miles by rail N. by E. of Augusta. It contains several mills and factories, and is the seat of Colby University (Baptist; 1820). Pop. 7107.

Water-violet, a plant of the genus Hottonia, so called from the likeness of its flower to the stock-gillyflower, once known as violet.

Watervliet. See SHAKERS.

Watford, a market-town of Hertfordshire, on the Colne, 15 miles (by rail 18) NW. of London. The Perpendicular church, restored in 1871, contains some interesting monuments of the Morrisons and Cassells, Earls of Essex, whose seat, Cassiobury, is close to the town; and there are also the London Orphan Asylum (inst. 1813; transferred hither, 1871), the Salters' Company's almshouses (1873), the endowed schools (1874), the public library and school of art (1874), &c., besides manufactures of silk and paper. Pop. (1851) 6546; (1881) 12,162; (1891) 16,819.

Watkin, SIR EDWARD WILLIAM, was born at Salford in 1819, and was employed in his father's counting-house till 1845, when he became secretary to the Trent Valley Railway; and from that time onward he has been known as director or manager of several of the most important railways, especially of the South-Eastern. In 1861 he undertook a mission to Canada in connection with the union of the Canadian colonies, and was returned to parliament in 1864, his long parliamentary career being most closely associated with Hythe. He has done much to help in securing parks for the people, especially in Manchester, and was made a baronet in 1880. A strenuous promoter of the Channel Tunnel, he contributed the article on that head to this work. Another undertaking of his was the (unfinished) Wembly Park Tower, between Willesden and Harrow, designed to exceed the Eiffel Tower (q.v.) in height. In 1889 he acquired by purchase part of Snowdon. He is a knight of various foreign orders, and was created a baronet in 1880.

Watling's Island, one of the Bahamas (q.v.), the probable landfall of Columbus.

Watling Street, one of the great Roman highways of Britain, commencing at Dover, passing through Canterbury and Rochester to London, and thence to Chester and York, and northwards in two branches to Carlisle and the Wall in the neighbourhood of Newcastle. Traces of the ancient road are still to be found in many parts of its course, and in some it is still an important highway; a street in London retains its name. It was the line of division in the treaty between Alfred and Guthrum the Dane, and it is still the boundary between Warwickshire and Leicestershire. Of the 'Waetlings' nothing is now remembered. Perhaps a trace also survives in the name Wattlesborough, a place on Watling Street near Wroxeter (*Uriconium*).

Watson, RICHARD, divine, was born at Heversham in Westmorland in August 1737. He was educated at Trinity College, Cambridge, and was elected fellow (1760), professor of Chemistry (1764), and regius professor of Divinity (1771). He became archdeacon of Ely, and in 1782 bishop of Llandaff, retaining two rectories, but visited his diocese but rarely. A Liberal in politics and theology, he published, besides sermons, essays, and charges, an *Apology for Christianity* in answer to Gibbon (1776), and an *Apology for the Bible* (1796) in reply to Paine. He died 2d July 1816. See his egotistic autobiography (1817).

Watson, THOMAS (*c.* 1557–92), a writer of artificial love poetry, was a Londoner who studied at Oxford. He wrote Latin poems and Englished Italian madrigals, but is best known for his *Hecatompathia* (1582) and *Teares of Fancy* (1593).

Watson, WILLIAM, the son of a Wharfedale farmer, born 2d August 1858, published *The Prince's Quest* (1880) and *Epigrams of Art, Life, and Nature* (1884), but first attracted notice by *Wordsworth's Grave* (1890). *Odes and other Poems* appeared in 1894, *The Father of the Forest* in 1895, *The Purple East* (sonnets on the Armenian atrocities) in 1896, *The Hope of the World* (1897), and a collected edition of his *Works* in 1898. He also issued a volume of *Excursions in Criticism* (1893).

Watt, the name of the electrical unit of activity or rate of doing work. It is measured by the product of the voltage or electromotive force of the source into the current supplied. Thus a dynamo which is yielding 30 amperes at a voltage of 100 is working with an activity of 3000 watts. The watt is equal to 0·735 foot-pound per second; so that one horse-power per second is equal to 746 watts. It is customary to use the kilowatt as the practical unit. It is equal to a thousand watts or 1·2 horse-power per second. See ELECTRICITY, OHM, VOLT.

Watt, JAMES, improver, and almost inventor, of the modern steam-engine, was born at Greenock in Scotland on the 19th of January 1736. His father, a general merchant at Greenock, was long a member of the council of that burgh, and for a time a magistrate. His mother, Agnes Muirhead, was a woman of superior endowments. Two members of James Watt's family—his grandfather and an uncle—possessed some local reputation for scientific or engineering ability. The former was a teacher of mathematics, surveying, and navigation at Crawfordsdyke near Greenock; the latter was a land-surveyor and engineer. James Watt was very weakly as a child, and, being unable to go to school with regularity, he became to a great extent his own instructor. His mother taught him reading, and his father writing and arithmetic. He early

manifested a turn for mathematics and calculations, and a great interest in machines, and accordingly —his father's business, for which he had been destined, having greatly declined—he came to Glasgow in June 1754 to learn the trade of a mathematical instrument maker. After a year in Glasgow he went to London, but ill-health compelled him to return home about a year after; he had however made good use of his opportunities, and after his return he set up as a mathematical instrument maker in Glasgow. The incorporation of hammermen of that city put difficulties in his way; but the authorities of the university took him by the hand, appointed him mathematical instrument maker to the university, and gave him the use of premises within their precincts. He occupied these premises from 1757 to 1763, when he set up a place of business in the town. In 1767 he was employed to make the surveys and prepare the estimates for a canal projected to unite the Forth and the Clyde. He made surveys for various canals, for the improvement of the harbours of Ayr, Port-Glasgow, and Greenock, and for the deepening of the Forth, the Clyde, and other rivers. He was also employed on a survey for the Caledonian Canal (q.v.). In this and in other surveys, the accuracy of which was borne witness to by Telford, he made use of a new micrometer, and a machine, also of his own invention, for drawing in perspective.

As early as 1759 Watt's attention had been directed to the capabilities of steam as a motive-force by Mr Robison (q.v.), afterwards professor of Natural Philosophy in the university of Edinburgh, who was then a student in Glasgow. In 1761–62 Watt made a series of experiments on the force of steam, using a Papin's Digester (q.v.); but it was not till the winter of 1763–64 that he began the investigations which ended in his improvement of the steam-engine. A working model of the Newcomen engine, kept for the use of the natural philosophy class in the college, was sent to him to be put in repair. He quickly found out what was wrong with the model, and easily put it into order; but in doing this he became greatly impressed with the defects of the machine, and with the importance of getting rid of them. The result was that he hit upon the expedient of the separate condenser, which prevented the loss of steam in the cylinder. See STEAM-ENGINE, where his other important inventions, the use of the 'air-pump,' steam-jacket for cylinder, double-acting engine, &c., are described.

Watt, soon after perfecting his model, formed a partnership with Dr Roebuck, then of the Carron Ironworks, for the construction of engines on a scale adapted to practical uses; and an engine was erected at Kinneil, near Borrowstounness. But Roebuck got into difficulties; and nothing further was done until, in 1774, Watt entered into a partnership with Matthew Boulton (q.v.) of Soho near Birmingham, when, Roebuck's interest having been repurchased, the manufacture of the new engine was commenced at the Soho Ironworks. A patent for his invention had been taken by Watt in 1769, and a prolongation of his patent for twenty-five years was secured in 1775. This partnership was a fortunate one for Watt—Boulton was bold and enterprising; Watt was timid and shrank from the commercial side of affairs. The advantages of the new engine were in no long time found out by the proprietors of mines; and it soon superseded Newcomen's machine as a pumping-engine. Watt afterwards made numerous improvements in its construction, and in conjunction with his partner Boulton he immensely improved the quality of the workmanship employed in building engines and other machines. Between 1781 and 1785 he obtained patents for a series of inventions—among them the sun and planet motion, the expansion principle, the double engine, the parallel motion, and a smokeless furnace. The application to the steam-engine of the governor was Watt's crowning improvement. He described a steam-locomotive in one of his patents (1784), but did not prosecute it further, neither did he encourage his chief assistant Murdock (q.v.) in his experiments. He also invented a letter-copying press, machines for copying sculpture, and numerous devices unconnected with the steam-engine, several of which he patented. It is curious to recall that Boulton and Watt attempted to secure an act of parliament forbidding the use of high-pressure engines; Watt persisted in the use of steam at low pressure. Watt's claims to be the first discoverer of the composition of water were long and strenuously maintained (see WATER, p. 565).

He retired from business in the year 1800, giving up to his two sons, James and Gregory, his interest in the extensive and prosperous business which Boulton had created at Soho. He showed the same alert and active mind after his retirement. The attic room at Heathfield Hall, his house near Birmingham, where he used to work alone, is still preserved, in its old condition. Here he was perfectly happy, working with his turning-lathe, and amongst his tools and models. In the earlier portion of his life he suffered much from ill-health. He had quickness of apprehension, a powerful memory, and an immense store of well-digested miscellaneous information outside his own domain. In conversation his utterance was slow and unimpassioned, with a quiet, grave humour, while his manners were gentle, modest, and unassuming. He died at Heathfield on 19th August 1819 in his eighty-fourth year. There are many monuments to Watt; the inscription on that in Westminster Abbey is from the pen of Lord Brougham. Watt stands at the head of all inventors, and the honours paid to his memory and to himself in his later years appear to have been deserved by his personal qualities, no less than by the immeasurable benefits which his inventive talents have conferred upon the human race.

See J. P. Muirhead, *Origin and Progress of the Mechanical Inventions of James Watt* (3 vols. 1854), comprising a memoir, letters, and patent specifications; Muirhead's *Life*, abridged from his larger work (1 vol. 2d ed. 1859); Smiles, *Lives of Boulton and Watt;* Williamson, *Memorials of the Lineage of Watt* (1856); Cowper in *Proc. Inst. Mech. Engineers*, Nov. 1883.

Watt, ROBERT, bibliographer and physician, was born the son of a small farmer near Stewarton in Ayrshire in May 1774, and studied for the church at Glasgow University (1793–97). He subsequently studied medicine at Edinburgh, and was licensed in surgery and pharmacy, which arts he practised in Paisley and in Glasgow (1799–1817). At his death (12th March 1819) he was a distinguished physician, accoucheur, and lecturer on the practice of medicine at Glasgow. He wrote medical works on diabetes, consumption, and hooping-cough, and a moral work, *Rules of Life;* but he is best known by his valuable (though far from complete or infallible) *Bibliotheca Britannica* (4 vols. 4to. 1824; see BIBLIOGRAPHY), which orginated in a catalogue (published 1812) of a library he gathered for the use of his students.

Watteau, ANTOINE, was born at Valenciennes, in October 1684, and in 1702 he betook himself to Paris, where for some time he earned a livelihood by the sorriest hack-work for a picture-dealer. He subsequently received instruction from Gillot, and got employment with Andran, the decorator of the Luxembourg, and in 1711 became a student at the Academy. In 1717 he was made a member of the Academy, and became famous as the creator of a new type of art. There is a

strange contrast between the gaiety of his art and the melancholy of his life constantly overshadowed by ill-health. In 1718 he visited England to consult Dr Richard Mead, then famous, for whom, during his stay, he painted one or two pictures. After his return home his health gradually declined; and on 18th July 1721 he died of consumption at Nogent, near Paris. In virtue of their charming colour and graceful design, the pictures of this master of the Rococo age still enjoy a high vogue, though his reputation as an artist is now but an echo of that which, in his lifetime, he enjoyed. He employed himself chiefly in painting small landscapes, with something of the nature of the *Fête Galante* going on in them—mock-pastoral idylls in court-dress. The largest collection of Watteaus—that made by Frederick the Great—belongs to the German emperor; and many are in the hands of English collectors.

See the *Catalogue raisonnée* of his works by De Goncourt (1875), and the monographs by Cellier (1867), J. W. Mollett (1883), Vollbehr (Hamb. 1885), Hannover (Copen. 1888), Dargenty (Paris, 1891), Nantz (Paris, 1891), and Claude Phillips (*Portfolio*, 1895).

Wattle. See ACACIA.

Wattle-bird (*Anchochæra carunculata*), a wattled Honey-eater (q.v.) of Australia, with wattles half an inch long. The plumage is variegated gray, brown, and white, and the flesh is delicious eating. In a Tasmanian species (*A. inauris*) the wattles are over an inch long.

Watt's Dyke. See OFFA'S DYKE.

Watts, ALARIC, was born in London, March 16, 1797, and died there, April 5, 1864. He had four years' schooling at Wye and Ashford in Kent; was an usher at Fulham and Runcorn, and a newspaper editor at Leeds and Manchester; married in 1821 the Quakeress, Priscilla Wiffen (1800–73), a sister of the two Spanish scholars; founded the *United Service Gazette* (1833); and made a great hit by his annual, the *Literary Souvenir* (1824–37). Latterly he was less successful, and in 1854 he was granted a pension of £100. He published two volumes of poetry, but one piece only by him is remembered—the alliterative *jeu d'esprit*, 'An Austrian army awfully arrayed,' &c. The Life by his son (2 vols. 1884) contains some interesting sketches of his contemporaries.

Watts, GEORGE FREDERICK, painter, was born in London, 23d February 1817, sent a picture to the Academy in 1837, but formed his style during a three years' sojourn in Italy after the old masters, especially of the Venetian school. He attracted public notice by his cartoon of 'Caractacus' sent to Westminster Hall in 1843, and again by pictures of 'Echo' and 'King Alfred' in 1847. He is above all things a poet-painter, but remarkable for his individuality, dignity, extreme correctness in drawing, splendid coloration, and exquisite purity of atmosphere. He has painted many noble portraits (not a few of them the most eminent of his contemporaries) and some fine landscapes; his historical subjects are in the grand dramatic manner, but he is best known by his magnificent pictorial moralities, emblems of profound and subtle import. He sympathised with many of the aims of the Pre-Raphaelite school, but stood quite apart from it. Among his more important paintings—familiar many of them by photogravures or other reproduction, though he has never been a 'popular' painter—are 'Paolo and Francesca' (1848), 'Fata Morgana' (1848), 'Life's Illusions' (1849), 'Love and Death' (1877), 'Watchman, what of the Night?' (1880), 'Hope' (1886). The exhibition of his works at the Grosvenor Gallery (1882), which included one of his admirable sculptures, comprised about half of his life's work. He has executed a fresco of St George in the Houses of Parliament, and another in Lincoln's Inn. He declined a baronetcy in 1894, when he sent 150 portraits (Carlyle, Browning, M. Arnold, Tennyson, &c.), as a gift to the nation, to the National Portrait Gallery.

Watts, HENRY, born in London, 20th January 1815, in 1837 became demonstrator at University College, librarian to the Chemical Society in 1850, and editor of its *Journal* in 1861. He translated Gmelin's *Handbuch der Chemie* (18 vols.) and other chemical works, but is best known by his *Dictionary of Chemistry*, based on that of Dr Ure (5 vols. 1863–68; supplements in 1872–75–81; new and revised ed. by Morley and Muir, 4 vols. 1889–94). He died 30th June 1884.

Watts, ISAAC, hymn-writer and divine, was born on July 17, 1674, at Southampton, where his father kept a boarding-school and wrote poetry. At sixteen he was sent to an academy in London kept by Thomas Rowe, an Independent minister. Here his devotion to his studies was so excessive as to permanently injure his constitution. In 1696 he became tutor in the family of Sir John Hartopp at Stoke-Newington, and there he remained six years, acting also as assistant to Dr Chauncy, minister of the Independent Church in Mark Lane, whom he succeeded in 1702. His health was throughout infirm; and in 1712 he was prostrated by an illness so violent that he never thoroughly recovered from its effects. A visit which he paid to Sir Thomas Abney at Theobalds for change of air resulted in his domestication in the establishment till his death, thirty-six years afterwards, on November 25, 1748. As his health permitted he continued to preach and to write. Though hardly over 5 feet high, and feeble physically, he was counted among the best preachers of his time, and his sermons by no means belie this reputation. His theology was marked by a large charity and catholic spirit then uncommon amongst Dissenters. The degree of D.D. was given him by Edinburgh in 1728. His theological works were numerous, but are now quite forgotten. His treatise on *Logic*, long since superseded, was once a text-book at Oxford. But this childless saint and scholar assured the perpetuity of his name by his *Divine and Moral Songs for Children* (1715), which, in spite of many a metrical defect and much hopeless prose, show strength, sanity, and the right simplicity without weakness. And in Dr Johnson's words, 'a voluntary descent from the dignity of science is perhaps the hardest lesson that humility can teach.' His *Horæ Lyricæ* (1706), *Hymns and Spiritual Songs* (1807–9), and *Psalms of David Imitated* (1719) contain nearly 500 hymns and versions, of which many remain amongst the cherished treasures of English devotion. It is enough to name but these: 'There is a land of pure delight,' 'Jesus shall reign where'er the sun,' 'When I survey the wondrous cross,' and 'O God, our help in ages past.' There are Lives by Dr Gibbons, Dr Johnson, Southey, Milner (1834), and E. Paxton Hood (1875).

Watts-Dunton, THEODORE (the name Dunton, his mother's, he assumed in 1896), poet and critic, was born in 1836 at St Ives in Huntingdonshire. His father, according to Norris's *History of St Ives*, was a solicitor and a naturalist, intimately connected with Murchison, Lyell, and other geologists, a pre-Darwinian evolutionist of considerable mark in the scientific world of London, and the Gilbert White of the Ouse valley. He received at Cambridge a somewhat elaborate private education, comprising music, art, and the physical sciences, especially biology. Settling in London, he soon became the centre of a very remarkable literary and artistic company. He is described

in the introduction to Philip Bourke Marston's collected works, by Mrs Chandler Moulton, the editor, as 'a poet whose noble work won for him the life-long and intimate friendship of Rossetti and Browning and Lord Tennyson, and was the first link in that chain of more than brotherly love which binds him to Swinburne, his house-mate at present and for many years past.' He thus came to exercise a most important influence on the art and culture of the day; but although he has written enough to fill many volumes—in the *Examiner*, the *Athenæum* (since 1876), the *Nineteenth Century*, the *Fortnightly Review*, &c.—he has let year after year go by without his collecting his essays, which, always dealing with first principles, have ceased to be really anonymous, and are quoted by the press both in England and in Germany as his. But, having wrapped up his talents in a weekly review, he was only ephemerally known to the general public, except for the sonnets and other poems that from the *Athenæum*, &c., had found their way into anthologies, and for the half-dozen articles on poetic subjects that he contributed to the *Encyclopædia Britannica* and the present work. The poems of his which are most generally known are 'The Burden of the Armada' and 'The Ode to Mother Carey's Chicken,' the latter of which has been often reprinted in England and America. The chief note of his poetry —much of it written in youth—is its individuality, the sources of its inspiration Nature and himself. His prose essays—literary mainly, but ranging also over folklore, ethnology, science generally—are marked as much by their independence and originality as by their suggestiveness, harmony, incisive vigour, and depth and breadth of insight. They have made him a force in literature to which only Sainte-Beuve, not Jeffrey, is a parallel. Mr Swinburne has styled him 'the first critic of our time—perhaps the largest-minded and surest-sighted of any age,' and Rossetti in a published conversation said the same thing. In 1898 he published *The Coming of Love*, his first volume of collected poems, and in 1899 made a great hit with the Gypsy romance of *Aylwin*.

See, besides works cited at Rossetti, W. Sharp's *Sonnets of the Century* (1887), preface to *The New Day* of Dr Hake (1890), and A. Miles's *Poets of the Century* (1892).

Waugh, EDWIN, the Lancashire poet, was born January 29, 1817, at Rochdale. As a youth he was apprenticed to a local printer and bookseller, but on the expiration of his apprenticeship he seems to have devoted himself almost entirely to literature. With his removal to Kelsal near Manchester he became one of the most active members of the Manchester Literary Club, of which he was at one time president. His first sketches of Lancashire life and character appeared in the *Manchester Examiner*, and at once attracted friendly attention to the author. Among Mr Waugh's numerous prose writings may be cited his *Factory Folk during the Cotton Famine*, the *Besom Ben Stories* (possibly the best of his humorous pieces), *The Chimney Corner* (a series of exquisite village idylls), and the admirable descriptions of natural scenery in his *Tufts of Heather*, *Irish Sketches*, and *Rambles in the Lake Country*. But it is as a singer rather than as a story-teller that our author will be best remembered. For several years he had been in the habit of contributing dialect songs to various periodicals, and these pieces, first collected in 1859 as *Lancashire Songs*, secured for their author immediate recognition as a poet. Rivalling the Cumbrian poems of Robert Anderson, and comparing favourably with the best work of the rustic followers of Burns, these rude lyrics won the hearts of his countrymen by the power, pathos, and kindly humour with which he paints the homely ways and thoughts of his country-people; indeed few poems enjoy such popularity in Lancashire as Waugh's 'Come whoam to thi childer an' me.' As an expositor of dialect Mr Waugh merits high praise. The nice shades of local *patois*, current in villages separated by only a few miles, are tenderly discriminated, and the idiom is nowhere maintained to the tedium of the general reader, but relieved by brilliant descriptive passages written in Mr Waugh's terse and pure English. Outside his native county Mr Waugh's rendering of dialect is somewhat less happy, and the specimens of the country speech of Cumberland and Ireland, as given in *Jannock* and *Irish Sketches*, can scarcely be accounted a success. In 1882 Mr Waugh became the recipient of a small pension from the Civil List. With failing health he removed to New Brighton, Cheshire, where he died, April 30, 1890, of cancer in the throat. Personally Mr Waugh was the centre of a large circle of friends, who delighted in his genial wit and powers as a *raconteur*. The best edition of Waugh's collected works is that in 11 vols., with Caldecott's illustrations.

Wauke'gan, capital of Lake county, Illinois, on the west shore of Lake Michigan, 36 miles by rail N. by W. of Chicago. It is mostly built on a bluff, 50 feet above the lake. Pop. 5345.

Waukesha, capital of a county, Wisconsin, on Fox River, 19 miles W. of Milwaukee. Pop. 6321.

Waurin, JEHAN DE, an old English chronicler, whose work comes down to 1471. The *Recueil des Croniques et Anchiennes Istories de la Grant Bretaigne* was edited for the Rolls series (5 vols. 1864–91). Vols. i. and ii. were translated in 1864–87.

Wausau, capital of Marathon county, Wisconsin, 210 miles NW. of Milwaukee; pop. 9251.

Wauters, ÉMILE, born at Brussels, 29th November 1846, has painted many great historical pictures, and is a remarkable portraitist.

Wave. When the surface of a sheet of water is disturbed waves are invariably produced. These may vary in magnitude from the huge rollers of the Atlantic to the tiniest observable ripple. The broad characteristic of such wave-motion is that as the waves pass over the surface at a considerable speed the liquid itself simply rises and falls with a slight to-and-fro motion in a steady rhythmic manner. The wave, in short, is a particular state of motion handed on from one portion of the water to another. It is energy, not matter, that is transmitted. In the case of ordinary sea-waves it is not easy to see that gravity is the effective dynamic agent in their propagation. In accordance with hydrodynamic principles the tendency must be for the water at the crest of a wave to be pulled down to the level of the water in the neighbouring trough, and for the latter to be pushed up to the level of the former. Corresponding to this surface oscillation there must be at any point below the surface an oscillation in pressure. Also at any instant the pressure will vary from point to point along a horizontal line drawn in the fluid in the direction in which the wave-motion is being propagated. These conditions obviously imply a definite motion of the particles of the fluid. If we suppose this motion of the fluid itself to be so small that we may neglect the square of its value, we are able to determine mathematically the character of the motion in the simplest type of oscillatory waves sustained by the action of gravity. Two simple cases are usually distinguished according as the length of the wave is great or small compared with the depth of the liquid. In the former case we have the propagation of long waves in shallow water. Each particle of liquid describes an ellipse

with longer axis horizontal. As the depth increases this ellipse diminishes in size, and becomes more elliptical. At the bottom the liquid simply moves to and fro in a straight horizontal line. The velocity of the wave is equal to the square root of the product of the total depth of the liquid into the acceleration due to gravity, in symbols $\sqrt{gh}$. The shallower the water the more slowly will the waves pass.

In the other simple case we find a type of which the deep-sea wave may be taken as an example. Each particle of fluid describes a circle, which rapidly diminishes in size as the depth increases. The velocity of wave-propagation is given by the formula $v^2 = gl/2\pi$, where l is the wave-length and π is the ratio 3·14159... . Thus, with a wave-length 4π or about 12·6 feet, the velocity of propagation will be 8 feet per second or 5·6 miles per hour. Again, with a wave-length of 100π—a length by no means uncommon with Atlantic rollers after a gale—the waves will travel at 40 feet per second or 27·3 miles per hour. Atlantic waves from 500 to 600 feet long and from 44 to 48 feet high have been observed to take from 10 to 11 seconds to pass. This gives a velocity of 50 or 55 feet per second. The theoretical formula gives 50·6 and 55·4 feet per second respectively. The Hydrographical Bureau of Washington records the observation of a wave half a mile long which took 23 seconds to pass. According to the formula it should have taken 22·7 seconds. These comparisons show that so far as the value of the velocity is concerned the simple theory is very satisfactory.

This theory, which is avowedly an approximation, gives a wave form whose crests are similar to the troughs. Now a glance is sufficient to show that the crests are sharper and the troughs flatter than this similarity would require. Stokes has, however, carried the approximation a step further, and finds that the steeper crests and flatter troughs are quite accounted for; also that the particles are, on the whole, carried forward in the direction of propagation of the wave.

In the case of oscillatory waves the disturbance, as already noted, rapidly diminishes as the depth increases. Thus at a depth equal to one wave-length the disturbance of the water is only $\frac{1}{535}$th of that at the surface; and at a depth of two wave-lengths, only $\frac{1}{300000}$th of that at the surface. With the largest ocean waves the agitation has an inappreciable effect at even moderate depths.

Near a shore-line or beach the to-and-fro motion of water along the bottom must have its effect on the material accumulated there. Signor Cornaglia has made some very valuable observations on the formation of beaches along the shores of the Mediterranean. He finds (as the theory also indicates) that the bottom water under a crest moves in the direction of the wave-motion, and that the water under a trough moves in the opposite direction. A stone or other object lying on the bottom will, as wave follows wave, be subjected to pressures acting in alternate directions. If the bottom is inclined, as in the case of a shelving beach, the shoreward push due to a passing crest is greater than the seaward push when the trough is passing. The seaward push will, however, be aided by the resolved part of the weight of the stone acting down the slope. At a certain depth, depending on the inclination of the slope and on the size of the waves overhead, the landward push will just be balanced by the seaward push together with the resolved part of the weight. In shallower depths, that is, nearer the shore, the landward push will have the advantage, and the effect of the waves will be to carry material up the beach. On the other hand, in greater depths, that is, farther from the shore, the other forces will have the advantage, and the materials will tend to be carried out to deeper water. Thus there exists near to every shore a neutral line or strip, above which sediment tends to move up, and below which it tends to be carried away to greater depths. In the Mediterranean this neutral line lies at a depth of from 26 to 33 feet. Signor Cornaglia shows the importance of this phenomenon in relation to estuaries and harbours, which become silted up if their mouths and openings are on the land side of the neutral line, but remain deep if their outlets are on the sea side of the neutral line.

As oscillatory waves flow in upon a shelving beach they gradually change character. The troughs become flatter, and the crests become sharper. At length the crest begins to curl over, and finally topples as a breaker upon the beach. If we regard these waves as oscillatory waves in shallow water, we see that their velocity should diminish with the depth. Hence there is a tendency for the advancing wave, which, so to speak, strives to keep its original momentum, to be retarded by friction on the bottom. Hence the crest tends to outstrip the lower parts of the wave, and the result is the breaker. It is certain, however, that as the depth becomes smaller and smaller the waves lose their true oscillatory character and become solitary waves or waves of translation.

The solitary wave was discovered and studied by Scott Russell, the eminent engineer. To this class belongs the long wave which accompanies a canal-boat, and which we see traversing the canal when the boat is stopped. The most favourable rate at which a canal-boat can be drawn is when its velocity is such that it rides on the crest of the solitary wave. When this condition is not fulfilled part of the work done by the horse is expended in producing fresh solitary waves. The speed of the wave is measured by $\sqrt{gh'}$, where h' is the height of the crest of the wave above the bottom of the canal. In a canal 8 feet deep the boat's most favourable speed would be a little greater than 16 feet per second, or about 11 miles per hour. Boussinesq and Rayleigh have worked out the theory of the solitary wave, and their conclusions agree very well with the observations made by Scott Russell. For example, the latter observed that when the height of the wave was equal to the depth of the undisturbed liquid the wave began to break; and the theory shows that with this relation of depth and height the water at the crest is moving horizontally with the speed of the wave. One characteristic of this solitary wave is that when it is a crest the water is displaced forward a definite amount and does not return. On the other hand, when it is a trough the water is displaced backward—i.e. opposite to the direction of propagation of the solitary trough. For this reason the solitary wave is also called the wave of translation. It is found that a solitary trough is very unstable; and it is doubtful if a solitary crest can remain permanently of the same form even on a frictionless fluid.

Stationary waves in running water, such as may be seen on any shallow brook with uneven bed, belong to another class of waves. One particular inequality, a large stone for example, will produce one conspicuous wave and a number of smaller ones accompanying it. The conditions of the problem are difficult to state; and very little has been done in the discussion of it. Lord Kelvin has shown that a certain relation between the speed of the water and the average depth determines whether there is a crest or trough formed over the inequality.

With water-waves whose wave-lengths are longer than 1 foot gravity is practically the efficient agent in propagating the wave-motion. But when

the waves get small another agent comes into play —viz. the pressure due to the Surface-tension (q.v.) of the curved surface of the water. This pressure acts downwards over the convex crest and upwards over the concave trough. Its magnitude increases with the curvature, which becomes greater as the wave-length becomes smaller. Thus the influence of the surface-tension in accelerating the speed of the wave becomes more pronounced as the wave is taken shorter and shorter. When a wavelet becomes so small that the surface-tension is more effective than gravity, it is distinguished by the name of ripple. There is a certain particular wave-length for which gravity and surface-tension have equal effects as regards the speed. Shorter wave-lengths are ripples, longer wave-lengths are waves; and the speed of the wavelet having this critical wave-length is a minimum. All other ripples and waves, whatever be their wave-lengths, travel faster. For any speed greater than this minimum speed two wave-lengths correspond. In other words, for any given wave propagated mainly by gravity there corresponds a ripple propagated at the same speed mainly by surface-tension. These statements are all contained in the following formula which expresses the speed (v) of waves on the surface of fresh water in terms of the wave-length (l): $v^2 = 61{\cdot}4l + 31/l$. The units are the inch and second. The first term on the right is the part due to gravity, the second the part due to surface-tension. The minimum speed (9·34 inches per second) is given when these two terms equal each other, so that the critical wave-length which separates ripples from waves is 0·71 inch. When the wave-length is $2\frac{1}{3}$ inches the speed is $12\frac{1}{2}$ inches per second, instead of 12 inches per second as it would be under the influence of gravity alone. Now the same value of v is obtained if we substitute 0·217 for l in the formula. That is, the *ripple* of wave-length 0·217 inch travels with the same speed as the wavelet of wave-length $2\frac{1}{3}$ inches. It is easy to see from the formula just given that the product of the wave-lengths (in inches) of the ripple and wavelet which move with the same speed must equal $\frac{31}{61\cdot4}$ or ·505, so that if the one wave-length is given the other can be at once calculated.

A very pretty experiment due to Scott Russell, but first discussed fully by Lord Kelvin, gives a practical demonstration of the fact that to every ripple there corresponds a wave having the same speed. Let a thin rod, dipping vertically in smooth water, be drawn through it at a speed of 10 inches per second or more. In front of the rod a group of ripples advancing with it will be formed, and behind will be seen the corresponding wavelets travelling also with the rod. These combine to produce a beautiful pattern on the surface of the water. If we increase the relative speed of the rod and the water the ripples in front get shorter, and the wavelets behind get longer. On the other hand, a diminution of speed causes the ripples to lengthen and the wavelets to shorten until for a particular speed they are equal in wave-length. For slower speeds wave patterns are not formed.

Any disturbance of the surface of water results in the formation of waves. A stone falling in, or a fish rising, produces a series of wavelets or ripples travelling outwards in widening circles. Of all agents that have to do with the generation of waves wind is, however, the most effective. An almost inappreciable puff of air will produce tiny ripples on an otherwise smooth water-surface. The first production of such ripples must depend upon the variations of vertical pressure accompanying the breeze; but once they are fairly started the momentum of the wind itself will have its direct influence on the wavelets. The power of wind in lashing up the surface of water is shown on a grand scale in every storm at sea.

Besides water-waves, which have been the chief object of discussion in this article, there are numerous other kinds of wave-motion which are essentially involved in many physical phenomena. For example, Sound (q.v.) has to do with waves travelling in elastic media, either as waves of compression and dilatation or as waves of distortion. A similar kind of wave-motion accompanies Earthquakes (q.v.). Then, again, the whole of physical optics is built upon an elaborate theory of wave-propagation, the exact nature of which is yet to be discovered (see LIGHT, POLARISATION, &c.). Maxwell's brilliant theory that the wave-motion which constitutes light is an electric rather than an elastic phenomenon has virtually carried the day; but it remains to find a dynamical explanation of electricity itself, or, at any rate, to conceive an ethereal medium whose fundamental property is a capacity to transmit wave-motions of the kind required. For an account of phenomena depending on the coexistence of wave-motions, see INTERFERENCE. See also HARBOUR.

Waverley. See FARNHAM.

Wavre, a town in the Belgian province of Brabant, 15 miles SE. of Brussels by rail; pop. 7432. Here on the 18th June 1815 there was a fiercely contested battle between the Prussians under Thielmann and the French under Grouchy, in which the Prussians successfully prevented the French from joining Napoleon at Waterloo.

Wax, the name given to some animal and vegetable substances, and even to one or two mineral bodies, which more or less resemble beeswax both in their appearance and in their physical properties. Beeswax and Chinese *pe-la* wax are of animal origin: Carnauba palm-wax and myrica-wax are vegetable products; and ozokerite (see BITUMEN) is an example of mineral wax. The true waxes differ from fats in not yielding glycerine when they are made into soaps with alkalies.

Beeswax is secreted by bees, and of it they build the walls of the cells of their comb. When this is drained of honey it is melted in boiling water, and the wax which floats on the surface is collected in the solid state when the water cools. Raw beeswax is of an impure yellow colour, so that for many purposes it requires to be bleached. Its fracture is finely granular, and it has a peculiar glistening appearance when rubbed which, when seen in other bodies, is called waxy. The melting-point of beeswax varies from about 139° to over 146° F., and its sp. gr. is ·960. It is soluble in ether, turpentine, benzole, and some other liquids, but not in alcohol. It contains about 85 per cent. of *myricin*, a compound of one of the higher ethers of the ethyl series with palmitic acid. Myricin is a crystalline fatty body melting at 162° F., and having the formula $\left.\begin{matrix}C_{16}H_{31}O\\C_{30}H_{61}\end{matrix}\right\}O$. It differs from ordinary fats by yielding on saponification myricyl alcohol, a crystalline fatty body, in place of glycerine. *Cerotic acid*, $C_{27}H_{54}O_2$, is also present in beeswax to the extent of about 12 per cent., and generally in the free state. This acid is dissolved by boiling alcohol in which the other bodies composing wax are insoluble. As both myricin and cerotic acid are crystalline and brittle, and melt at higher temperatures than wax itself, the tenacity and plastic character of the latter is ascribed to the presence of a comparatively small quantity of a softer substance named *cerolein*, which does not seem to have been as yet thoroughly investigated. *Melissic acid* ($C_{30}H_{60}O_2$) was first prepared by Brodie from the myricin of beeswax, in which it has lately been

found in the free state. With one exception it is the highest known member of the fatty acids. It fuses at 194° F. (90° C.).

Beeswax is bleached by dividing cakes of it into ribbons, which are spread on canvas, kept moist and exposed to sunshine. The ribbons are turned over at intervals, and occasionally sprinkled with water. After a first bleaching the wax is melted, formed once more into ribbons, and again exposed to the sun's rays. A third treatment of the same kind is usually required. Only solar bleaching will suit when it is to be used for candle-making, and for this purpose the wax also requires a previous treatment with acid. Wax can, however, be bleached with chemical agents. Candles of this material cannot be made, like those of stearin or paraffin, in moulding machines, since they do not part freely from the moulds. They are manufactured by first pouring melted wax on wicks arranged round a hoop, and when they have reached the proper thickness they are rolled in the plastic state on a marble slab. Candles of beeswax, owing to its greater hardness, have less tendency to 'gutter' than those made of stearin or paraffin. Beeswax has also a pleasant odour. By itself it makes by far the best carriage candles, and when these are made of other materials beeswax is sometimes mixed with them. But its high price limits its use for such purposes. It is employed for waxing floors of polished wood, as an ingredient in making some varnishes, for making lithographic crayons, and as a resist in printing patterns on calico.

Wax was of importance to the ancients for writing-tablets (see WRITING), the writing produced by the sharp end of the stylus being, when it had served its purpose, obliterated by the other end. The art of modelling figures and portraits in wax dates from prehistoric times. Beeswax was used for this purpose by the ancient Egyptians. The ancient Greeks practised the art with great skill at least 300 years B.C., and developed the method of casting in bronze by means of wax now known as *cire perdue* (see FOUNDING, Vol. IV. p. 752). Wax was the material in which the patterns or models for both large and small works of art in bronze were usually finished in ancient and Renaissance times, and was so employed that it might melt away in the casting of them. The Romans were wont to have wax portraits of their ancestors set up in their entrance-halls as evidence of ancient pedigree. Wax was also the material with which the colours for *encaustic* painting practised by the ancients were made up. The remarkable portraits, believed to have been executed in the earlier centuries of our era, which were discovered by Dr Flinders Petrie at Fayyûm in Egypt, were painted with pigments laid on with melted wax. A modern kind of encaustic (see MURAL DECORATION) is sometimes called *wax-painting*. Wax and other images were used with evil intent in Magic (q.v.). In the 14th and 15th centuries sculpturing in wax, or cero-plastics, was practised by artists of good standing, who have left mainly figures in low relief or statuettes. But Vasari praises a large portrait statue of Lorenzo de' Medici by Verrocchio and Orsino, of which the framework was wood, clothed with real garments, the face, head, and hands being of wax. But no skill evades the lividness of the flesh or the ghastly stare of the glass eye; and wax-portraiture has been abandoned by artists proper, and left to the skilful workmen who manufacture portrait figures of royal personages, popular characters, and distinguished murderers for shows, perambulating or permanent. Of the latter that of Mme. Tussaud (q.v.) is the best known. Wax-modelling has also a humbler sphere in the making of one kind of artificial flowers, composed of thin leaves of coloured wax, surface painted in detail with proper pencils, and artificial fruit, and in producing tailors' dummies, as well as anatomical models and pathological specimens; and embryological models, now much used in the teaching of zoology, are usually made of wax.

Beeswax is produced in nearly all the temperate and tropical countries of the world. Large quantities are obtained from southern Asia and North Africa. East Indian wax mostly comes from hilly regions, the bees which produce it being wild or semi-wild. The amount of beeswax annually imported into the United Kingdom is about 50 tons. Its price in the bleached state is £7 per cwt.

Chinese wax is produced by *Coccus ceriferus*, Fabr. (*Coccus pe-la* of Westwood), living on the ash-tree *Fraxinus chinensis*, and belonging to the same genus as the lac-insect (see LAC). This beautiful substance resembles spermaceti in general appearance. It has a highly crystalline structure, and is very hard for a wax, its melting-point being 180° F. Chemically it consists chiefly of ceryl cerotate. Although this should be an excellent material for making candles, their manufacture from it presents some points of difficulty. It is perhaps owing to this, still more to its high price, that the wax has never become an article of much commercial importance in Europe. But it is so in China and Japan, where it is used for making candles, or for coating candles of inferior materials, and also for sizing paper and textiles. The average annual production in China is valued at £600,000. The price per cwt. is £7, 10s.

A wax similar to the Chinese pe-la is produced in Japan by an insect which is probably another species of coccus living on *Ligustrum Ibota*. It is, however, not abundant enough to be of industrial importance.

Spermaceti.—See this head.

Carnauba wax is found in thin films on the leaves of a Brazilian palm (*Copernicia cerifera*). It consists chiefly of myricyl cerotate and myricyl alcohol. Its melting-point is 185° F., rising to about 195° F. when long kept, and its specific gravity is about ·99. This substance is made into candles to a large extent in Brazil, but it is only used in limited quantities in the candle manufacture in England. A small proportion of it mixed with other candle-making materials is useful in destroying the 'mottle' which some of these have a tendency to show. Carnauba wax is used to adulterate beeswax, and on the Continent to mix with such substances as stearin and cerosin to make cheap 'wax' candles for church purposes. The imports of Carnauba wax into England, though not large, are increasing—2500 bags in 1891, and much more in 1892. The price is £3 per cwt.

From the stem of *Ceroxylon andicola*, the wax-palm of the Andes, a resinous exudation is obtained, about one-third of which consists of a wax used for making candles (see PALM). A similar substance is produced by *Klopstockia cerifera*, another South American palm.

Japan Wax is obtained from the fruit of several species of Rhus, of which *R. succedanea* is the most important, but *R. vernicifera* and *R. sylvestris* also yield it. The berries contain the wax between the kernel and the outer skin. The raw wax is of a greenish colour, and is cut into strips and bleached white by exposure to the sun. This wax is mostly composed of palmitin, and is therefore rather a fat than a true wax. Its melting-point varies from 124° to 128° F. It is important as a candle-making material in Japan, although but little used for this purpose in England. It has a rather unpleasant smell. Japan wax is an ingredient in some polishing mixtures for furniture and leather, and it is

also employed to make a transparent castor-oil pomade. The imports of it into England, amounting to 625 cases in 1892, are very variable. The price per cwt. is £1, 18s.

Myrtle-berry Wax.—The berries of several species of Myrica are coated with a waxy substance. In the United States the wax from *M. cerifera*, which is a rather soft greenish substance, with a melting-point of 123° F., has been much used (more or less mixed with beeswax) for candle-making. It consists most largely either of free palmitic acid or of palmitin with some myristin. *M. cordifolia* of South Africa and other species found in South America yield myrtle-wax (see CANDLEBERRY).

Paraffin-wax.—Solid paraffin is so called. When of good quality for candle-making, it is a comparatively hard, pure white substance resembling beeswax, but rather more translucent. It has neither taste nor odour, and is not acted on by either alkalies or acids, with the single exception of nitric acid, which slowly attacks it, but only when this acid is at or near its boiling-point. Paraffin dissolves with the aid of heat in various naphthas (those from shale, petroleum, and coal-tar), in turpentine, ether, bisulphide of carbon, and to some extent also in alcohol and fatty oils. Paraffins are found in commerce with various melting-points, but all are mixtures of hydrocarbons belonging to the marsh-gas or paraffin series (see HYDROCARBONS). Those melting between 70° and 118° F. have a crystalline structure and are classed as soft paraffins. Such as melt between 115° and 150° F. (about the highest that can be made) are called hard paraffins, and in these the crystalline texture disappears. The hard are less easily dissolved than the soft kinds.

Besides its extensive use in candle-making, paraffin is employed for a great many purposes in the arts, such as for laundry purposes along with starch, for dressing textile fabrics and for rendering them waterproof, in the manufacture of perfumes from flowers, and to give a finish to certain articles made of wood, bone, or leather. In the United States it has been extensively consumed as a chewing-gum, and has been tried with some success as a preservative of fruit. Soft paraffin is largely bought for dipping matches. Paraffin purified without the use of acid has recently come into extensive use as an insulator by electricians. See PARAFFIN, CANDLE, and HYDROCARBONS.

Sealing-wax (q.v.) is not now made of wax at all.

Wax-bill (*Estrelda astrilda*), a well-known small South African bird, much in repute in other lands as a cage-bird, is about 4 inches long, and has a bright red bill, the translucency of the horny covering giving it a waxy appearance.

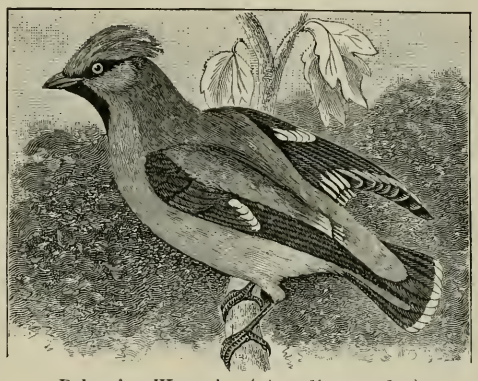
Wax-palm. See WAX.

Wax-plant. See ASCLEPIADACEÆ.

Wax-tree (*Vismia*), a genus of plants of the natural order Hypericaceæ, having a five-parted calyx, and five petals, generally covered with soft hairs on the inside. All the species yield a yellow resinous juice when wounded, which, dried, has similar properties and appearance to gamboge, and in commerce is named American gamboge. The species are natives of tropical America.

Wax-wing (*Ampelis*), a genus of small passerine birds in which the secondary quills of the wings, and sometimes other feathers of wings or tail, are tipped with red horny appendages like sealing-wax. There are three species: the Bohemian Wax-wing or Chatterer (*A. garrulus*), found in the northern hemisphere of both old and new worlds; the Japanese Wax-wing (*A. phœnicoptera*); and the



Bohemian Wax-wing (*Ampelis garrulus*).

smaller Caroline Wax-wing or Cedar-bird (*A. cedrorum*).

Waxy Degeneration (also called *amyloid* or *lardaceous* degeneration) is a morbid process in which the healthy tissue of various organs is transformed into a peculiar substance, allied in its chemical composition to albuminous substances. Organs affected by this degeneration have a certain resemblance in consistency and physical character to wax. They may be cut into portions of the most regular shape, with sharp angles and smooth surfaces; and the thinnest possible slices may be removed by a sharp knife for microscopical examination. Such organs are abnormally translucent, increased in volume, solidity, and weight. Usually the first parts affected by this degeneration are the small blood-vessels, the middle or muscular coat being first changed. Subsequently the adjoining tissues become similarly affected. When a solution of iodine is brought in contact with such tissues, a deep reddish-brown colour is produced; and this colour is alone a sufficiently characteristic test. Although amyloid degeneration is common to many tissues and organs, the parts most frequently affected are the spleen, liver, kidneys, lymphatic glands, and intestines. Waxy degeneration is very rarely met with as a primary condition. It is almost always the sequel to some chronic wasting disease, and is particularly associated with profuse and long-continued suppuration, as in strumous disease of bone, diseases of the lungs, kidneys, or intestines, with much purulent discharge; and with advanced constitutional syphilis. It can thus rarely be regarded as itself the cause of death, though it may materially hasten the fatal issue. No treatment is known to be of any avail; but when the degeneration is not very far advanced, it may gradually disappear if the suppuration or other morbid condition which has led to its development is arrested.

Wayland, the Smith (A.S. *Veland;* old Norse, *Völundr;* Ger. *Wieland*), a hero of German saga, who was originally a kind of demi-god in popular mythology, with points of identity with the Greek Hephæstus and Dædalus. He was son of the sea-giant Wade, a nephew of King Wilkinus, and was first bound apprentice to the famous smith Mimir. Then he was carried across the sea to the dwarfs, whom he soon surpassed in their own science. He dwelt a long time in Ulfdaler along with his two brothers, Eigil, the best archer, and Slagfidr, and here they met three swan-maidens, with whom they lived for seven years, until these flew away to follow battles as Walkyries. Afterwards Wayland came

to King Nidung, who cut the sinews of his feet and put him in prison, for which he revenged himself by putting the king's two sons to death, and violating his daughter Baduhild, who afterwards gave birth to Wittich. Wayland then flew away in a feather-robe, which he himself manufactured, and which his brother Eigil had tried first, only to be precipitated to the ground. By skilfully piecing together the various old legends, Simrock has produced the Saga of Wayland as a whole in his poem *Wieland der Schmied* (1835), and in the 4th part of his *Heldenbuch* (1843). The legend is often alluded to in Scandinavian, Anglo-Saxon, English, and German poems, and even old French poems tell of Galant the smith. Wayland Smith's Cave, a two-chambered megalithic monument, near the White Horse in Berkshire, is immortalised in *Kenilworth*.

See Depping and Michel, *Veland le Forgeron* (1838); Grimm's *Deutsche Mythologie;* Müller, *Mythologie der deutschen Heldensage* (1886); and Golther, *Die Wielandsage* (*Germania*, vol. xxxiii.).

Wayne. Anthony, an American general, was born at Easttown, Pennsylvania, January 1, 1745, the grandson of a Yorkshireman who commanded a body of dragoons at the battle of the Boyne, and emigrated to Pennsylvania. Raising in 1776 a regiment of volunteers, he was appointed colonel of it, and sent to Canada, where he covered the retreat of the provincial forces at Three Rivers. He commanded at Ticonderoga until 1777, when he was made brigadier-general, and joined Washington in New Jersey. He fought bravely at Brandywine; led the attack at Germantown; captured supplies for the distressed army at Valley Forge; distinguished himself at Monmouth; was defeated at Paoli; but achieved his most brilliant victory in the carrying of Stony Point with the bayonet at midnight, July 15, 1779. His courage and skill saved Lafayette in Virginia in 1781; and he aided in the siege of Yorktown. At the close of the war, rewarded by popular enthusiasm, and having, by his dash and audacity, acquired the sobriquet of 'Mad Anthony,' he retired to his farm in Pennsylvania, subsequently took up a tract of land granted to him in Georgia, and sat in congress for a few months. Appointed, on Washington's recommendation, in 1792 general-in-chief of the army, he next year commanded a successful expedition against the Indians of the north-west, founded Fort Wayne, and in 1795 signed a treaty with the Indians by which the United States acquired a large addition of territory. He died at Presque Isle (now Erie), Pennsylvania, 15th December 1796.

Wazan, an inland town of Morocco, picturesquely situated on the steep northern slope of a two-peaked mountain, in the hill-country 90 miles SE. of Tangier; pop. 20,000. It is a sacred city and a place of pilgrimage, the headquarters of the Grand Shereef. The principal buildings are the great mosque and the tombs of a long line of shereefs. The trade is, as elsewhere in Morocco, mainly in the hands of the Jews. See Morocco; also Watson, *A Visit to Wazan* (1880); and Harris in *Blackwood's Magazine* (1892).

Wazirabad, a town of the Punjab, 21 miles N. of Gujranwala by rail; pop. 16,462.

Waziris, an Afghan hill tribe, inhabiting the highlands between the Kuram and the Gomul passes on the western frontier of the Punjab—now in British territory. See map at Afghanistan.

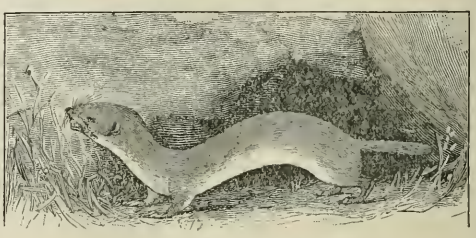
Weasel (*Mustela vulgaris*), a common carnivore belonging to the same genus as the marten, sable, polecat, mink, and stoat. It is widely distributed throughout Europe, northern and central Asia, and the northern parts of North America. The body of the male is about 8 inches in length, the tail 2½ inches; the female is somewhat smaller. The colour of the upper parts is reddish brown, of the under parts pure white. In northern regions



Weasel (*Mustela vulgaris*).

and in very cold winters the weasel occasionally becomes pure white, just as the stoat becomes the white ermine. Like related species, the weasel is characterised by courage out of proportion to its size, by agility and wariness, and by pertinacious blood-thirstiness. It feeds on rats, mice, voles, moles, and frogs, but may also destroy young rabbits and birds. Often the blood of the victim is sucked and the brain eaten, or the body may be dragged home and left till it becomes semi-putrid. In its hunting it is most persevering, keen in scent and sight; it will take to the water after the water-vole, or climb to a bird's nest; it usually sleeps during the day, and is most active at night. Like many of its relatives it bites severely and has a disagreeable smell. A nest of dried leaves and moss is made in a sheltered hole in the ground or in a tree trunk, and there in spring the litter of four to six young are reared. Against hostile intruders the mother defends her offspring to the death. The fur is sometimes used, but the animal is too small to be commercially important.

Weather. See Meteorology.

Weathering. See Denudation.

Weaver-bird (*Ploceidæ*), a family of passerine birds numbering between 200 and 300 species, which bear considerable resemblance to the finches, and are, indeed, often spoken of as such. The name has reference to the remarkable structure of the nests of many of these birds, which are woven in a very wonderful manner of various vegetable substances, and are objects of great interest. The Ploceidæ are natives of the warmer parts of Asia, of Africa, and of Australia; none being found in Europe nor in America. They are small birds, with a strong conical bill, the ridge of which is slightly curved, the tip entire. The wings are pointed or rounded, the first quill remarkably short, and the males of many species have a distinct summer and winter plumage, the former acquired by moulting some of the feathers. This is the case in the genus Pyromelana, for example, in which the males in full plumage are adorned with the most brilliant yellow, orange, or scarlet, set off by velvety black. They are often called 'bishops;' and the species represented is yellow above and black below, with brownish wings and

tail, when 'in colour' as shown. There is great diversity in the form and appearance of the nests constructed by different species. One of the best-known species is the Baya (q.v.) of India. Many of the other weaver-birds construct nests pretty much on the same plan with this—pouches elongated into tubes, entering from below; those of some are kidney-shaped, and the entrance is in the side. They very generally suspend their nests in the same way from the extremities of branches, and often prefer branches which hang over water, probably as affording further security against monkeys, squirrels, snakes, and other enemies. Social habits are very prevalent among them, and many nests of the same species are often found close together. Some of them attach the nest of one year to that of the year preceding, as the *Nelicurvixes nelicourvi* of Madagascar, which sometimes thus makes five nests in succession, one hanging to another. Some of the African species build their nests in company, the whole forming one structure. Thus the Social or Republican Weaver-bird of South Africa (*Philhetærus socius*), often called Social Grosbeak, constructs a kind of umbrella-like roof, under which 100 to 200 nests have been found, the nests like the cells of a honeycomb, and arranged with wonderful regularity. An acacia with straight smooth stem, such as predaceous animals cannot easily climb, is often selected by the bird-community. When the situation is chosen, the birds begin by constructing the roof, which is made of coarse grass, each pair afterwards building their own nest, which is attached to the roof. As new nests are built every year, the weight of the structure often becomes so great as to break down its support. The Red-billed Weaver (*Textor panicivorus*) is a large species of the weaver-bird group, which is commonly seen in South Africa accompanying herds of buffaloes, and feeding on the bots and other insects which infest them, alighting on their backs to pick them out of the hide. The bird is often of great use to the buffalo in another way, by giving warning of the approach of an enemy. The Whydah Birds (q.v.) likewise belong to the group of Ploceidæ; and a large number of (usually) small seed-eating birds, commonly imported as pets, are referred to this family, such as Avadavats or Amadavats (*Estrelda amandava*), Waxbills (Pytelia), Mannikins (Munia—not to be confused with the Manakins, i.e. Pipridæ), and the well-known 'Java Sparrow' (*Munia oryzivora*), of which there is a white domestic variety. The 'Bengalese' of bird-dealers are white and pied varieties of a Mannikin (*Munia striata*) domesticated for centuries in Japan; and many other Ploceidæ will breed, more or less freely, in captivity.

Baya Weaver-bird and Nest (*Ploceus baya*).

Weaving is the art of forming a web or cloth by the intersecting of two distinct sets of fibres, threads, or yarns. The one set of yarns which pass in a longitudinal direction from end to end of the web is called the warp; the yarn which crosses and intersects the warp at right angles is called the weft. Textures made by knotting, twisting, and knitting are distinguished from woven fabrics by the fact that the yarns in these proceed in the same direction or have similar functions, while in knitting one continuous thread alone is used. The art of weaving, even in its simplest form, demands a certain amount of manual dexterity combined with some mechanical skill; and therefore, although one of the most ancient and fundamental of human industries, its practice implies some amount of knowledge and civilisation. It is, however, a universal art, and the textile skill of any people has in all ages been a measure of their culture and advancement. Indisputably, also, next to the industries connected with the production of food, those related to the manufacture of cloth are the most important of all arts, and the inventive genius, patient skill, knowledge, and taste which have been lavished on cloth-making have been, beyond all measure, greater than have been devoted to any other range of industries.

Weaving in general implies the preparation of yarns by spinning; but in making haircloth, woven wire, and some kinds of matting yarns are not employed. The simplest form of weaving is that employed in making the mats of uncivilised nations. These consist of single untwisted fibres, arranged side by side to the width required, and of the length of the fibres themselves, which are tied at each end to a stick, which is so fixed as to keep the fibres straight, and on the same plane, as in fig. 1. Then the weaver lifts up every other of these longitudinal threads, and passes under it a transverse one, which he first attaches by tying or twisting to the outermost fibre of the side he commences with, and afterwards in the same way to that on the other side, when it has passed through the whole series.

Fig. 1.

Hand-loom.—But all weaving proper is done in a loom, which may be a very simple and primitive apparatus, or it may range upwards in complexity of mechanical contrivance and delicacy of adjustment to one of the greatest triumphs of human ingenuity. In the simplest operation of weaving it is necessary to pass one set of threads transversely through another set, divided into two series, working alternately up and down, so as to receive the transverse threads in passing, and interlock them, forming thereby a united surface out of the threads. The loom is made to assist the weaver in this operation after the manner shown in fig. 2: A, A, A, A is the frame of the loom, and is of no other use than to hold the working-parts in their proper position. At each end of the frame a roller is placed, B, C, so that they will readily turn on their axes; and from one to the other the threads of the warp are attached, and kept tight by the weights *b*, *b*. The warp-threads are wound round the roller B, the *beam* or *yarn-roll*, only as much of each thread being left unwound as will reach to the other roller C, the *cloth-beam*, to which the ends are fastened, and upon which the cloth is wound as it is woven.

The next step is to divide the warp-thread into two equal sets by raising up every alternate one, and inserting between them a smooth rod of wood,

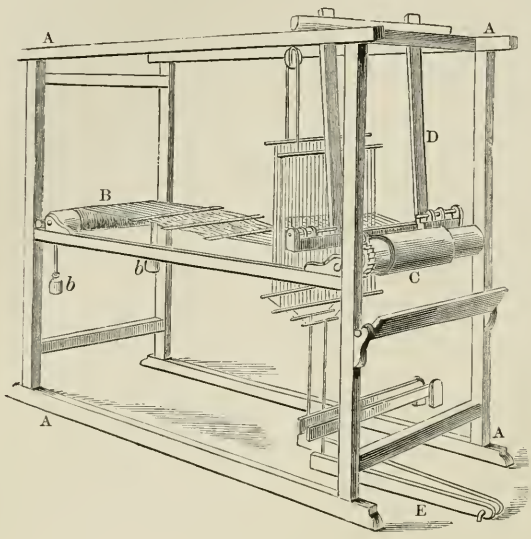


Fig. 2.

to prevent them entangling or returning to their former position. This separation takes place before the final fixing of the ends of the threads to the *cloth-beam*, because, previous to that, each thread must be passed through a small eye or mail in a perpendicular thread called the heald, which hangs down from the rod A in fig. 3 (in which only six heald-threads and six warp-threads are shown, for the sake of rendering the action clearer). There are always two sets of healds in the simplest form

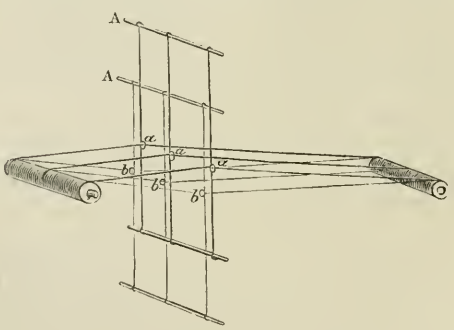

Fig. 3.

of loom, and the threads of the warp are divided alternately by the mails of each heald, so that if one heald is raised it lifts every alternate thread of the warp, and if the other is depressed it pulls down the opposite set of threads; thus, in fig. 3, the three threads of the warp are seen to pass through the three upraised threads of one heald by the loops *a*, *a*, *a*, and the three remaining threads of the warp pass through the depressed healds by their loops *b*, *b*, *b*; the united action of the two healds opens a space between the two sets of warp-threads. This space is called the shed, and through it is thrown the shuttle which carries the thread of the weft; when the weft has passed through, the healds are reversed, and the lower warp-threads now become the upper ones. The threads, after each intersection, are driven up tight by the reed, which is a narrow frame with transverse wires set sufficiently far apart for two or more threads of warp to pass through each; it hangs to the frame called the batten (fig. 1, D). The movement of the batten is produced by the hand of the weaver, whilst that of the healds is readily effected by the treadles E.

At each end of the batten is a shuttle-box, in either of which the shuttle rests when the loom is not in operation. The shuttle of the form seen in fig. 4 is usually made of boxwood, its ends shod with iron. The middle part is hollowed out into a small box, open on the upper side. In this box the bobbin, on which the yarn or thread is wound, is placed, with its two ends on pivots, admitting of its being turned by the slightest strain on the yarn; the end of the yarn passes through a hole in the side of the shuttle, as seen in fig. 4. Between each shed the shuttle is projected by the agency of the picker, moved by the picking-stick held in the right hand of the weaver, along the shuttle-race between the shed-warp from shuttle-box to shuttle-box, and the beating up of the thread left by the shuttle completes one pick of the loom. When coloured patterns are being produced, or when for any reason more than one kind of weft must be frequently interchanged, a number of shuttles corresponding to the varieties of weft must be used. In such case a compound shuttle-box containing as many compartments as there are kinds of weft is required, and a mechanism is applied to the loom for bringing any particular shuttle into line at the time it is needed.

Fig. 4.

Power-loom.—But into the manifold devices by which the loom has been brought to the perfect condition it has attained it would be impossible here to enter. The ordinary hand-loom, while fully exemplifying all the principles of weaving, is now, for nearly all purposes, superseded by the power-loom. Automatic weaving was substantially the invention of the Rev. Edmund Cartwright (q.v.), who himself thus graphically narrates the course of his experiments:

'It struck me that as in plain weaving, according to the conception I then had of the business, there could be only three movements which were to follow each other in succession, there would be little difficulty in producing and repeating them. Full of these ideas, I immediately employed a carpenter and smith to carry them into effect. As soon as the machine was finished I got a weaver to put in the warp, which was of such material as sail-cloth is usually made of. To my great delight a piece of cloth, such as it was, was the produce. As I had never before turned my thoughts to anything mechanical, either in theory or practice, nor had ever seen a loom at work, or knew anything of its construction, you will readily suppose that my first loom must have been a most rude piece of machinery. The warp was placed perpendicularly, the reed fell with a force of at least half a cwt., and the springs which threw the shuttle were strong enough to throw a Congreve rocket. In short, it required the strength of two powerful men to work the machine at a slow rate, and only for a short time. Conceiving in my great simplicity that I had accomplished all that was required, I then secured what I then thought a most valuable property by a patent, 4th April 1785. This being done, I then condescended to see how other people wove, and you will guess my astonishment when I compared their easy mode of operation with mine.

Availing myself, however, of what I then saw, I made a loom in its general principles nearly as they are now made, and it was not till the year 1787 that I completed my invention, when I took out my last weaving patent, August 1 of that year.'

As first put on the market, the power-loom was a cumbrous and clumsy machine, which competed with much difficulty against the hand-loom. But by degrees various adaptations and accessories were added to the loom, which enormously increased its efficiency, until it attained that swiftness and certainty of action, and that power of producing all variety and quality of work, which now characterise it, and go to make it the most marvellous of all mechanical combinations. In fig. 5 is seen the skeleton of a power-loom divested of its working-

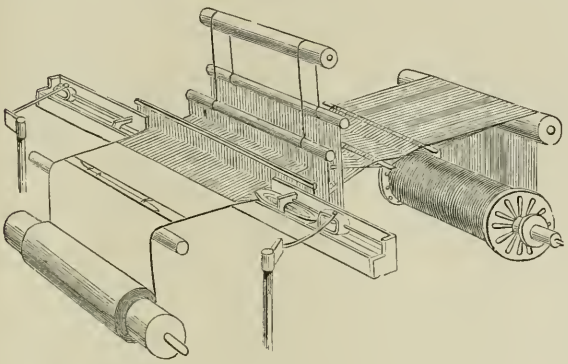

Fig. 5.

parts, in which there is necessarily great variety. The whole of the complicated series of motions is invariably derived through the crank-shaft which revolves under the web.

Loom-mounting.—Before the weaver is in a position to proceed with the formation of the simplest of webs, a number of most important preliminary operations are necessary. These are embraced under the general name of loom-mounting, and include, in the case of warps, the warping, sizing, beaming, healding, and sleying of the yarn. Warping consists in bringing together and arranging in parallel order and in uniform length the number of threads which are required for the breadth of web to be formed. Sizing or dressing is an operation in which the warp yarn so assembled is treated with a glutinous or pasty compound to give the threads increased compactness and tenacity. Beaming consists in spreading the warp uniformly over the warp-beam, the width of the web to be made, and in rolling it around the beam in a regular manner, keeping the threads parallel and in straight order. Healding or drawing-in is the most important of all operations in loom-mounting, or indeed in weaving, for on it the whole nature of the weave depends. In the case of the simplest of all weaves, the making of plain or tabby cloth, only two heddles or heald-shafts are required in the loom, and the warp is drafted in alternate threads through the mails or loops in each shaft. Thus the odd threads, 1, 3, 5, 7, &c., are passed in orderly succession through No. 1 shaft, and the alternate 2, 4, 6, 8, &c. go through shaft No. 2. In this way the warp is divided into two equal quantities. After being drafted through the healds, the warp is passed between the splits or dents of the reed, two, three, or four threads being carried in each split, according to the size of reed and width of web. It then only remains to carry the warp over the breast-beam, attach the ends to the piece-beam, and the operation of weaving may be begun.

Weaves.—With two shafts of healds in the loom it is possible only to produce a plain web, and no variation of pattern can arise except from the introduction of stripes by the use of coloured warps or of checks by using also different coloured wefts. A section of plain cloth is seen in fig. 6.

Fig. 6.

When more than two shafts of healds are mounted in the loom, therewith begins the possibility of variation. With three shafts a simple twill can be produced, in which the weft flushes or passes over one and under two warp-threads alternately, thereby producing a kind of diagonal furrow, which runs from edge to edge of the cloth. In this simple weave the warp-threads are equally divided among the three shafts, and in regular succession two are raised while one is depressed to form the shed. Viewed transversely, this twill is shown in fig. 7. From this point upwards the possibility of combination and variation with the use of additional shafts of healds increases enormously. Thus with four shafts many combinations, regular and irregular, may be formed, the simplest and most common of which is known as the Cassimere twill, in which two weft-threads flush over and under two warp-threads alternately in a diagonal direction. When the number of shafts exceeds four it becomes possible to obtain a sateen weave such as is the basis of figured damasks and similar textures. In weaving a sateen only one shaft of healds, whatever number there may be in the loom, is depressed at each pick; consequently the warp flushes smoothly over the weft, giving the cloth a smooth feel and lustrous appearance, especially in fine linens and silks. The production of figured damasks depends on the combination of plain and sateen weaves, the effect in silks being heightened by the use of different colours also. But for the production of a

Fig. 7.

complete pattern of any considerable dimensions a large number of picks or shots of the shuttle are needed, and for each pick there is a different combination of warp-threads in the shed. Now the number of heald-shafts it is possible to mount in a loom is limited, and besides it is impossible for a hand-loom weaver to operate more than twelve or sixteen treadles, and each shaft of healds requires a separate treadle. It is only very small and simple figured designs which can be completed in that number of picks; and when the separate sheds of warp number hundreds and even thousands it is obvious that some other means must be devised for obtaining the sheds than can be secured by healding. By means of a mechanical attachment called a witch or dobbie-frame, it becomes possible to actuate up to about forty-eight sets of healds by a single pair of treadles, but beyond that number of combinations healds are not used. For all complicated patterns each warp-thread is passed through an independent suspended loop or mail, and thus it becomes capable of entering into an endless variety of combinations of sheds. Before the invention of the Jacquard apparatus the weaver had the difficult and tedious task of tying together the combinations in each separate shed of

his pattern, an operation called 'tying the harness,' and these sheds were attached to a 'draw-boy' apparatus, by which they were mechanically operated in their proper sequence.

Jacquard Loom.—The great invention of Jacquard entirely obviated the tedious task of harness-tying, and so simply effected what was formerly a difficult, complex, and tedious operation that now the most varied and extensive pattern can be woven with as much ease and rapidity as a piece of plain cloth. The apparatus was invented in 1801 by Joseph Marie Jacquard (1752–1834), a native of Lyons, who, stimulated by reading an account in an English newspaper of the offer of a premium for any person who should invent a machine for weaving nets, set his wits to work to improve the existing machinery for weaving. The reception of his great invention by the public was most dispiriting, for, though Napoleon rewarded him with a small pension, the silk-weavers themselves offered such violent opposition to its introduction that on one occasion he narrowly escaped with his life, and his machine was broken up by the body of men who, under the title of Conseil des Prud'hommes, were appointed to watch over the interests of the Lyonnese traders. But on the spot where the machine was publicly destroyed a statue now stands, to show the gratitude of a more enlightened generation.

The merit of the invention was too great to admit of its being long suppressed, and when its value was once fairly recognised it effected a complete revolution in the art of weaving, especially in the finer kinds of figured silk fabrics. The Jacquard apparatus can be adjusted to almost every kind of loom, its office being merely to direct those movements of the warp-threads which are required to produce the pattern, and which previously were effected by the weaver's fingers. The warp-threads are each (as in the common weaving process) passed through a small loop in the lifting-thread, so as to be raised by means of the treadles, which act directly upon the lifting-bars; these lifting-threads (fig. 8, *i*, *i*, *i*, *i*, *i*) are attached to certain wires in

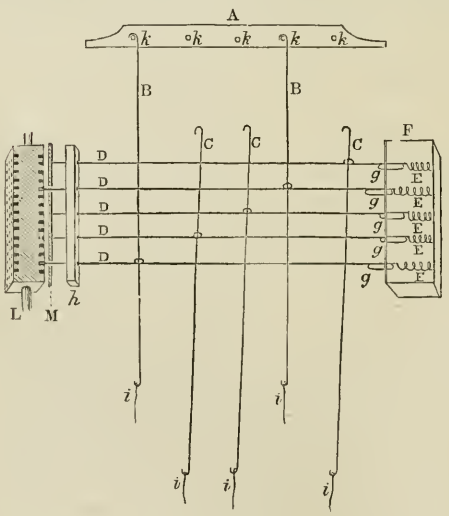

Fig. 8.

the Jacquard apparatus, which form a rigid continuation ending in a hook, which, when nothing interferes, is caught and raised by each upward motion of the lifting-bar; thus, A is the lifting-bar, and it has five projections (*k*, *k*, *k*, *k*, *k*), upon which the hooks of the wires catch when in a straight position, as at B, B, but which miss them if they be thrown out of the perpendicular, as at C, C, C. There are only five of these wires given, to prevent confusion, but practically there must be one for every thread of the warp—i.e. one for every thread in the width of the cloth to be woven. Each of the lifting-wires passes through a horizontal needle placed at right angles, D, D, D, D, D, which has a loop formed for the purpose, thus, at *f* (fig. 9). This needle passes freely through an

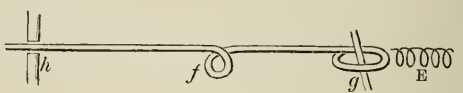

Fig. 9.

opening in the frame at *h*, and is so looped on to another rod, *g*, on the spring-box F, that it moves freely without fear of displacement, and if pushed back into the spring-box is made to press upon one of the spiral springs, E, which restores it to its place as soon as it is freed from pressure. In the diagram (fig. 1) this pressure is supposed to be exerted upon three of the lifting-wires, C, C, C; consequently, if the lifting-bar A is simultaneously raised, those three wires are missed, whilst the other two, B, B, being in position, catch the projections *k*, *k*, on the bar, are drawn up with it, and thus raise the threads of the warp to which they are attached. Now, the regulation of this pressure upon the horizontal needles is effected by a revolving square drum, which has each of its four sides perforated with rows of holes, which, like the needles and lifting-wires, correspond in number to the threads of the warp. This drum, when in its place, receives into one row of perforations the whole row of needles where they project through the frame at *h*, and it has a motion given by the machinery which brings each row on its four surfaces in regular order into the same position; and if no impediment is offered all the needles are undisturbed, and the upright wires lift the entire set of warp-threads to which they are attached. But in order to produce the necessary variations of motion required by the pattern, a set of cards are made each of the width of the square face of the drum; these also are so perforated that when placed on the surface of the drum their perforations correspond exactly with those on the face immediately beneath them; but the cards are perforated in exact accordance with the pattern, so that intervals occur in which there are no perforations to correspond with those on the drum face; hence, when the drum L (fig. 8) is brought up to the frame *h*, some of the needles will find entrance into the holes of the drum through the corresponding perforations in the covering card, seen in section M, fig. 8; but others will be prevented entering by the absence of such perforations, and the card, by the resistance it offers, will force the needles thus opposed back upon the springs E, E, E, removing thereby the hooks of the lifting-wires from the action of the lifting-bar. The cards are looped together at the corners, and move as an endless chain on the drum faces, and the entire set of perforations on the whole chain of cards exactly represents the pattern to be produced; the same as the notes represent the air in a piece of music.

Into the numerous varieties of weaving and the modifications both of looms and cloth it is quite impossible here to enter. The ribbon-loom is a most distinctive structure, in which many small webs are simultaneously woven; and the apparatus in which tubular fabrics, such as seamless sacks, is woven is an ingeniously modified loom. Of the leading varieties of weaving it must suffice simply

to mention double-cloth, in which two warps are simultaneously woven and combined into one fabric; looped textures, like Brussels carpeting, which with the loops cut become pile fabrics, as, for example, velvet; and gauze or leno, in which the contiguous warp-threads make a half-twist around each other between each throw of the shuttle.

See Darlow, *History and Principles of Weaving* (1878); Ashenhurst, *Treatise on Weaving and Designing Textile Fabrics* (1888); Beaumont, *Woollen and Worsted Cloth Manufacture* (1888); Brown, *Practical Treatise on the Power-loom* (1887); *The Textile Manufacturer*, and other technical periodicals and journals; also the articles CARPETS, COTTON, LINEN, RIBBON, SILK, SPINNING, THREAD, VELVET, WOOL, &c.

Weber, CARL MARIA FRIEDRICH ERNST VON, composer and pianist (1786–1826), came of a noble Austrian family whose musical proclivities seem to have grown with the decay of fortune. His father, Franz Anton von Weber, who began life as a soldier, excelled in violin-playing; likewise his uncle Fridolin, whose daughter Constanze became the wife of Mozart. Well advanced in a chequered career, Franz Anton married at Vienna in 1785 his second wife, Genovefa von Brenner, a singer of reputation. Returning thence to Eutin, near Lübeck, where but lately he had been Kapellmeister, he was glad to accept the humbler post of director of the town band. Carl Maria was born December 18 (?), 1786; and soon afterwards the restless father finally left Eutin with his wife and boy to wander from town to town at the head of a small dramatic company. The child was afflicted with hip-disease; but as soon as he could sit at the piano he was industriously plied with music lessons in the hope that he might rival the wonders of Mozart's early childhood. Other subjects were not neglected; and if his father's occupation conduced little to solid progress, the boy at least enjoyed endless opportunities of acquainting himself with the details of stage management. Carl Maria's serious training began in 1796 under Heuschkel of Hildburghausen, with whom he laid the foundations of his future skill at the keyboard. At Salzburg in 1798 he was taught by Michael Haydn and (now motherless) at Munich by Kalcher, to whose instructions in composition and pianoforte-playing were added singing lessons with Valesi. His very early productions young Weber for the most part destroyed; but portions of his second opera, *Das Waldmädchen*, written and produced at Freiberg before he was fourteen, he afterwards incorporated in *Silvana*, a work of greater maturity.

At Vienna in 1803 Carl Maria was warmly welcomed as a pupil by the Abbé Vogler, who obtained for him the conductorship of the opera at Breslau. This post Weber held for two years, adding to his already intimate knowledge of matters theatrical, and giving evidence of rare talent for organisation. As orchestral conductor he displayed powers truly surprising in one of his years, while he increased his mastery of the pianoforte to the highest pitch of excellence. On the other hand, Weber was oppressed by pecuniary difficulties. His salary was hardly £90 a year, his mode of life careless, and his father dependent upon him. To make matters worse, an accidental draught of poison imperilled his life and ruined his fine voice. Soon after his recovery he left Breslau at the invitation of Duke Eugene of Würtemberg for Schloss Carlsruhe, where he passed some happy months devoted to composition and the direction of the duke's band. His host subsequently had him appointed secretary to his brother, Duke Ludwig, at Stuttgart; but the position entailed many duties and pleasures sadly detrimental to his artistic development. Weber's plight soon became even worse than at Breslau, and at last his career in Stuttgart was brought to a tragic conclusion. During a rehearsal of his opera *Silvana* he was arrested on a charge of fraud. His innocence was clearly proved; banishment, nevertheless, followed on February 26, 1810. The injustice acted as a tonic, and was the means of restoring Weber to his proper domain.

The next twelve months he spent at Mannheim and Darmstadt in familiar converse with Vogler and his friends Gausbächer and Meyerbeer, composing meantime the operetta *Abu Hassan*. Three concertos were written at Munich in 1811 for Baerman, the celebrated clarinettist, with whom he made a lengthened concert tour, the news of his father's death reaching him in Berlin. Early in 1813 he settled at Prague as Kapellmeister of the opera, charged by the manager with the entire reorganisation of the company, and well repaid by the complete success of his administration. During a visit to Gotha he composed two magnificent patriotic songs to words from Körner's *Leier und Schwert*, and eventually eight others. Later, the victory of Waterloo inspired him with the cantata *Kampf und Sieg*, performed December 22, 1815.

In 1816, having resigned his post at Prague, he was invited by the king of Saxony to undertake the direction of the German opera at Dresden. The venture was an entirely new one, Italian opera having been so far in undisputed possession. Weber began by taking the local amateurs into his confidence through the medium of the press, explaining the object he had in view and the conditions necessary to success. He had to organise an efficient chorus and (more difficult task) to engage his leading artists. The orchestra, too, needed some reform. All this was not easily done; but tact, combined with theatrical omniscience, soon won for the new director the loyal co-operation of his staff and the admiration of all save the partisans of Morlacchi, the Italian Kapellmeister. After a few months Weber's appointment was confirmed for life, and to his other duties he was called upon to add the frequent direction of the music at the Chapel Royal. On November 4, 1817, he was happily married at Prague to Carolina Brandt, the famous singer. In 1818 he wrote his Mass in E flat, the Jubel cantata and overture, and the Mass in G for the royal golden wedding in 1819. *Der Freischütz*, begun in 1817, was not complete till May 1820. The applause which greeted its production at Berlin, on June 18, 1821, was echoed in other places; in London it was played simultaneously at three theatres. Friedrich Kind, who wrote the libretto, having chosen to quarrel with Weber, he accepted for his next opera, *Euryanthe*, the literary co-operation of Frau Helmina von Chezy. The work was produced at Vienna, October 25, 1823, the first three performances, conducted by the composer, being enthusiastically received; but it did not long survive his departure. In Dresden, Leipzig, and Berlin *Euryanthe* met with the appreciation due to the grandest of Weber's dramatic creations.

But his disappointment at the comparative failure of the effort into which he had put his whole strength occasioned a long period of depression, from which he roused himself only to write his final masterpiece, *Oberon*, undertaken at the request of Charles Kemble for Covent Garden Theatre. The subject was chosen by Weber himself, and the English libretto written by J. R. Planché. Kemble's offer of £1000 doubtless weighed with the composer, now nearing his end and anxious for the future of his wife and family. But it was far from being his only consideration. So determined was he to do his best that, ill as he was, he took more than 150 lessons in English.

March 1826 saw Weber in London, the guest of Sir George Smart, and busy with rehearsals at Covent Garden. The first performance of *Oberon* on April 12 was the crowning triumph of his life. During the next few weeks he conducted frequently at the theatre and played at many concerts. Such labour proved too much for his exhausted frame. He died during the night of June 4, and was buried at St Mary's, Moorfields, whence in 1844 his remains were removed to Dresden.

Weber has a special claim to fame as founder of German romantic opera. In this he was the direct forerunner of Richard Wagner, whose principles he anticipated not only by giving due prominence to other than purely musical considerations, but by writing music thoroughly in harmony with the character of the incidents represented. More or less tentatively exemplified in *Der Freischütz*, the conditions are fully carried out in *Euryanthe*, where dramatic recitative and declamation take the place of the spoken dialogue of its predecessor. But in other branches of composition he holds a high place, and has influenced every one of his successors.

Besides the works already mentioned he composed some earlier operas, the music to *Preciosa*, the overture *Beherrscher der Geister*, two symphonies, three concertos (including the Concertstück in F minor), several sonatas, &c. for the pianoforte, as well as a goodly number of scenas, dramatic pieces, cantatas, and songs, for a summary of which the reader is referred to Dr Spitta's excellent article in Grove's *Dictionary of Music*. Weber's pupil, Sir Julius Benedict, has left an interesting sketch of his master in the 'Great Musicians' series, edited by Francis Hueffer. See also German works by Jähns (Berl. 1871, and Leip. 1873) and Reissmann (Berl. 1882).

Weber, Ernst Heinrich, physiologist (1795–1878), was from 1818 till his death a professor of Anatomy and of Physiology at Leipzig. He was specially distinguished for his researches on the senses. For the law named after him, see Psychology, Vol. VIII. p. 473.—Wilhelm Eduard Weber, physicist (1804–91), was the brother of the preceding, and in 1831 became professor of Physics at Göttingen. He was one of the seven professors deposed in 1837 for their protest against the revocation by the king of the liberal constitution. Associated with Gauss in his researches, he was specially distinguished for his contributions to electricity and magnetism. See the monograph by Riecke (1892).—Georg Weber, historian (1808–88), was from 1848 to 1872 director of the Bürgerschule in Heidelberg, and wrote a long series of historical works. Among them are books on Calvinism in Germany, on the Reformation in England, on the period of the Reformation, a history of Israel, the origin of Christianity, and a history of literature. But he is best known by his *Manual of Universal History* (20th ed. 2 vols. 1888) and his larger *Universal History* (15 vols. 1857–80; 2d ed. 1882–90).

Webster, a manufacturing town of Massachusetts, on French River, 16 miles by rail S. of Worcester. Pop. 7030.

Webster, Daniel, American statesman and orator, was born at Salisbury, New Hampshire, 18th January 1782. His father, a sturdy farmer of the border, was a member of the state legislature and a county judge. As a child Daniel was delicate, and therefore exempt from the labours of the farm. He entered Dartmouth College in 1797, poorly prepared, but soon impressed his teachers with his remarkable power of acquiring what interested him and his fluent eloquence. He graduated in 1801, studied law at Salisbury and Boston, was admitted to the bar in 1805, and quickly rose into notice at Portsmouth, the chief town of his state. Political discussion also enlisted his energies, and with the New England Federalists he opposed the second war with Great Britain. Sent to congress in 1813, he served two terms, maintaining an honourable position in an unpopular party. In 1816 he removed to Boston, where he soon became prominent as an advocate. Having been admitted to the bar of the United States Supreme Court, he established his forensic fame by the Dartmouth College case, which formed an era in the interpretation of constitutional law. The New Hampshire Supreme Court had sustained the legislature in an attempt to remodel the college; but in 1818 Webster, by a great speech, moved Chief Justice Marshall to reverse that decision, and it was declared that the original royal charter of Dartmouth, in spite of the change of sovereignty consequent upon American independence, was still a contract which could not be impaired without violating the national constitution. In the field of popular eloquence Webster's fame was first made national by his oration on the 200th anniversary of the landing of the Pilgrims—an effort which was surpassed by his address at the laying of the corner-stone of the Bunker Hill monument, 17th June 1825, and equalled by his eulogy on Adams and Jefferson in August 1826.

Copyright 1892 in U.S. by J. B. Lippincott Company.

Returning to congress in December 1823 as a representative from Massachusetts, Webster found few rivals. Henry Clay, then Speaker of the House, made him chairman of the judiciary committee. His speech on the Greek revolution, delivered in January 1824, and translated into most European languages, extended his fame still more widely. It was the first expression of his conception of the grand destiny of the United States. After rendering important services in the House of Representatives, Webster was in June 1827 transferred to the senate, the scene of his greatest triumphs. In the early part of his congressional career he had favoured free trade and opposed the policy of protection. But in 1828 he gave his adhesion to Clay's 'American system,' and vigorously defended the new protective tariff. His reason for the change was that the people of New England, adapting themselves to the policy imposed on them by the previous action of the Federal government, had established manufactures, and that it was now the duty of the government to respect and uphold vested interests. Webster's whole career was marked by a deep reverence for established institutions and accomplished facts. The principle of nationality, the dominant passion of his mind, was fully manifested in his prompt and thrilling reply to Senator R. Y. Hayne of South Carolina, who had in January 1830 attacked New England as opposing the growth of the Union. After repelling personal assaults and the slanders on his native section, he exposed the fallacy of nullification, and portrayed with matchless skill an ideal of the Union, which deeply impressed the hearts of the people, and became thenceforth a potent factor in the national life.

Benton describes Webster as then 'the colossal figure on the political stage;' he was courted by President Jackson, whom he was destined soon to oppose stoutly; he was rivalled only by Clay and Calhoun, above whom he towered in intellect, but before whom he was deficient in will-power; and in the crisis 'will more than intellect was to rule.' After wearisome years of opposition the Whig party triumphed in 1840, and Webster was called into President Harrison's cabinet as Secretary of State. Harrison died a month later, and his successor, Tyler (q.v.), changed the policy of the administration. Four of the secretaries resigned, and Webster was criticised and denounced by his

own party for remaining. His persistence was justified by the successful negotiation of the Ashburton treaty with Great Britain. When this protracted business was finally settled he resigned in May 1843. In 1844 Webster refused his party's nomination for president and supported Clay, who was, however, defeated by Polk. In 1845 Webster returned to the senate. He assisted in averting a threatened war with England over the north-western boundary, which was fixed on the parallel of 49° suggested by him. His speech in defence of the Ashburton treaty in 1846 contained also answers to personal attacks on himself as being in the pay of New England manufacturers. The truth is that, being careless in money matters and lavish in expenses, he had accepted assistance from political friends, but he was entirely free from corruption or defalcation. The leading event of Polk's administration was the war with Mexico, which Webster opposed, as he did also any acquisition of territory by conquest. The war gave the Whig party its next candidate for the presidency, General Taylor. Webster bitterly declared the nomination 'one not fit to be made,' and refused the second place on the ticket. Yet he advised his friends to vote for Taylor, who was elected.

The question of slavery, which had long been agitated, now became the all-absorbing problem. Webster had held the prevalent Northern view that slavery was, under the constitution, a matter of domestic policy, left with the states, not to be interfered with by the general government. He deprecated the annexation of Texas and the extension of slavery, but he rebuked the formation of the Free Soil party, and in 1850, after expressing his approval of Clay's compromise, he wrote that he abhorred slavery, but was unwilling to break up the Union to abolish it. His final position was declared in his speech of the 7th March 1850, in which, after a dispassionate review of the history of slavery, he detailed the grievances of both North and South, giving emphasis and sympathy to the latter. His Northern friends were dismayed, while the Abolitionists were enraged. Whittier gave voice to a deep popular feeling in his *Ichabod*. Webster had come to regard slavery as one of the vested interests of the American nation. He had now lost his controlling influence in Massachusetts; but he was still a factor in national politics. After President Taylor's death in July 1850 Fillmore called him to his former post as Secretary of State, where again there were differences with England to settle—a protectorate in Honduras and disputes about the fisheries. Webster was deeply disappointed at not receiving the Whig nomination for the presidency in 1852. His health and spirits gave way, and he was obliged to retire from Washington to his home at Marshfield, Massachusetts, where he died on 24th October 1852.

Webster was the greatest of American orators. He was of large frame, and his brain greatly exceeded the average weight. His dark face, otherwise heavy, was lighted by large expressive eyes. His voice was of matchless compass, his utterance deliberate. Good taste, good sense, and an unrivalled gift of arrangement and style supported his glowing eloquence. The imposing dignity of his manner often rose to majesty, and he was called by his admirers 'the godlike Daniel.' As a secretary of state he was admirably qualified; his mighty memory and his power of working hard when he chose fitted him to deal with complicated international questions as they arose. But his statesmanship was throughout marked and limited by his reluctance to interfere with established institutions. His lasting service to his country was as the apostle of nationality. It must be admitted that his moral character deteriorated under adulation and the disappointment of his most cherished ambition. Had his conscience matched his intellect he would have taken a nobler position on the question of slavery, and might have attained the first rank among American statesmen. Dreading innovation, he was content to be known as 'the great expounder of the constitution.'

Webster's *Speeches, Forensic Arguments, and Diplomatic Papers* were published in six volumes (1851); his *Private Correspondence* in two volumes (1857). The best biographies are by G. T. Curtis (2 vols. 1869) and by Henry Cabot Lodge (1884).

Webster, JOHN, one of the great names of English Tragedy, was alive and writing for the stage between the years 1602 and 1624. But beyond this all is conjecture; when and where he was born and died it is impossible to ascertain. Webster is described on the title-page of one of his works as a merchant-taylor; and he was long supposed, on no sufficient authority, to have been at one time clerk of St Andrews, Holborn. For his name is not on the register of that parish, nor has research elicited any sound collateral evidence on the point. That he must be confounded neither with John Webster, the author of *The Saint's Guide*, nor with John Webster of Clitheroe, the careful investigation of the Rev. Alexander Dyce, the dramatist's first editor, has made certain. Here, then, the materials of the biographer end. Himself has said, 'I rest silent in my own work.' Webster's first recorded writing was a share in *Lady Jane* and *The Two Harpies*, a pair of patch-work productions, in which Dekker, Drayton, Chettle, and others were his collaborators; both are lost. In 1604 he made some additions to the *Malcontent* of Marston. How far these went we have no means of knowing, but we may conjecturally ascribe to him the 'Induction,' a sprightly prelude to what Marston well calls his *aspera Thalia*. In 1607 were printed *The History of Sir Thomas Wyat*, a tragedy, and two comedies, entitled *Westward Ho* and *Northward Ho*, all three the joint work of Webster and Dekker. The *History* is merely remarkable for a text singularly corrupt, but the twin-companions are a notable contrast. Both are vigorous, breezy, humorous plays, interesting as documents on the manners of their day. But while *Westward Ho* is an ill-constructed combination of prose and poetry (the best of it clearly Dekker's), *Northward Ho* is symmetrical, strong in construction, and written throughout in a sturdy, homespun prose, without hint of poetry from beginning to end. Five years later came the *White Devil*, and with its publication Webster entered his kingdom, rising near the level of the greatest tragic writers of any time. Pathos, passion, truth to nature, combined with astounding art of execution, are qualities seldom if ever more consummately displayed than here. *The Duchess of Malfi*, published in 1623, is a yet more supreme achievement in tragic art. All the great qualities of the *White Devil* are revealed with a still greater perfection of poetic beauty and verbal fitness. The story too is infinitely sympathetic. Pity and terror, the tragic emotions, are wrought to their uttermost of endurance. Published in 1654, *Appius and Claudius* has poetry, pathos, simplicity, and constructive excellence in the plot. But set beside these others it seems cold, pale, and merely pretty, lacking, in brief, the signal qualities of Webster's best work. *The Devil's Law Case* (1623), excepting only the excellent passages quoted in Charles Lamb's *Specimens*, is disagreeable and sordid. An ode on the death of Prince Henry, with other fragments of verse (all inferior to the noble prose of his prefaces), makes up the sum of Webster's writings. In 1664 Kirkman the printer, an

ignorant man and an unscrupulous, published two comedies, *The Thracian Wonder* and *A Cure for a Cuckold*, which he declared to have been written by Webster and Rowley. Kirkman's unsupported word proves nothing, and although some ingenuity has been exercised to prove Webster's paternity in the case of the former play, both actions may be unhesitatingly dismissed. In 1624 a tragedy entitled 'the recent murther of the sonn upon his mother, written by Forde and Webster,' was licensed for the stage. It is lost to us now, with how much more!

Not popular in his own day, Webster, in Mr Swinburne's happy phrase, 'found his first recognition at the pious and fortunate hands of Charles Lamb.' Since then he has been praised to reverence by various masters of criticism, and his name claimed by enthusiastic writers as the next in tragic art to Shakespeare's. An attempt at a detailed appreciation may be spared in the case of a dramatist whom Lamb and Hazlitt have praised in imperishable sentences. But a single word may be said of Webster's limitations as these are defined in Kingsley's *Plays and Puritans*, and elsewhere. Webster is charged with the faults of Tourneur—with having a diseased view of human nature, and the art of a poet of horror and the shambles. In support of the last part of the indictment the many terrible episodes of the *White Devil* and *The Duchess* are cited. But no poet should be judged by episodes and scenes removed from their context and considered in 'a cold abstraction.' The effect produced *on the reader as he reads* is the only just test, and to examine this is the true function of the critic as the other is that of the *advocatus diaboli*. To him who reads no episode in either of Webster's masterpieces seems forced and wrong; the atmosphere is charged with horror, and each point of terror is a just and natural step towards the catastrophe. For the rest it will suffice to say that no one ever rose from Webster's pages inspired with any but a more spacious, a loftier, and a braver view of life and its issues. There are instances without end in his best work where nature seemed to take the pen and write for him. But passion and pity and terror were the emotions that transcribed their secrets for him; not cynicism and nausea. The chosen epithet of Hazlitt in this connection, echoed by Mr Swinburne, is the last word on this dramatist: 'there is no nobler-minded poet than Webster.'

See C. Lamb's *Specimens of English Dramatic Poets*, &c., and Hazlitt's *Lectures on the Literature of Elizabeth*, &c. Webster's works were first collected by the Rev. Alexander Dyce (4 vols. 1830), next by Hazlitt (1857–58). See also the edition by Mr J. A. Symonds in the 'Mermaid' series, and Mr Swinburne's admirable essay in *The Nineteenth Century*, June 1886.

Webster, Noah, lexicographer, was born in Hartford, Connecticut, 16th October 1758. His studies at Yale College were interrupted by service in his father's company of militia in the war of independence, but he graduated in 1778, and thereafter took to teaching and to the study of law, being admitted to the bar in 1781. But he soon returned to teaching, and made so great a hit with the spelling-book which formed part of *A Grammatical Institute of the English Language* (3 parts, 1783–85) that for twenty years he and his family lived on its meagre royalty of less than one cent a copy. Political articles and pamphlets, lecturing, journalism at New York, a few years' prosperous practice of law at Hartford, and again journalism in a fresh venture at New York occupied his life till 1798, when he retired to a life of literary labour at New Haven. Here, with the exception of the years 1812–22 spent at Amherst, Massachusetts, he lived till his death, 28th May 1843. Long a devoted student of the English tongue, he published *A Philosophical and Practical English Grammar* (1807), and the famous *American Dictionary of the English Language* (2 vols. 4to, 1828), the fruit of the labours of twenty years.

A second edition followed in two volumes (1840–41), with a supplement in 1843. The chief later editions were those by Professor Chauncey A. Goodrich, his son-in-law (1847), that of 1864 (edited after Goodrich's death in 1860 by Noah Porter), in which the etymologies were by Dr C. A. F. Mahn of Berlin (supplement in 1879 by Professor F. B. Dexter), and the revision of 1890 executed under the supervision of Professor Noah Porter. See the Life by Horace E. Scudder in the 'Men of Letters' series (Boston, 1882).

Wedderburn, Alexander, a Lord Chancellor of England, ennobled as Lord Loughborough and Earl of Rosslyn, was born at Edinburgh, 13th February 1733, the son of a Scottish judge. He passed as advocate, but was called to the English bar in 1757. He entered parliament in 1762, took part in the great Douglas cause, and in 1771 left the opposition to become a strenuous supporter of Lord North as Solicitor-general. He supported the American war policy, and was made chief-justice as Lord Loughborough (1780); but in 1784, disappointed of the chancellorship, passed over to Fox, and curried favour with the Prince of Wales. Insinuating and unscrupulous, he next made friends with Pitt, by whom he was made Lord Chancellor (1793), but to whom he played false. Addington gave him his earldom (1801), and he died 2d January 1805.

Wedding Ceremonies doubtless arose by degrees and in different ways; and often when the mode of contracting a marriage altered, the earlier mode survived as a ceremony. Thus, for example, the system of capture was transformed into a mere symbol after purchase was introduced as the legal form of contracting a marriage, and again the custom of purchase has survived as a ceremony after it has ceased to be a reality. Marriage being a matter of some importance naturally begot ceremonial—symbolical of sexual intercourse, or of living together, or of the wife's subjection to the husband. And naturally religious rites would be added to give sanction—prayers, sacrifices to appease the gods. There was no religious contract among the ancient Hebrews, and there is no trace of priestly consecration in the Scriptures or the Talmud. Under Christianity a religious character came early to be given to the rite, although the early church, like the Buddhists, regarded marriage as little more than a concession to human weakness. The notion that marriage is a sacrament grew naturally out of St Paul's phrase, 'This is a great mystery' (Eph. v. 32), for the Vulgate translation renders *μυστήριον* by 'sacramentum.'

One of the most wide-spread rites of marriage is that of the man and woman eating out of the one dish, as we see it, for example, all over the Malay Peninsula, and elsewhere. Among the Roman three forms of marriage prayers, sacrifices, and auspices were essential only in the *confarreatio*, not in the *coemptio* and *usus*. In the first of these, the old patrician mode, the chief ceremony was the offering of a cake of spelt, made to Jupiter in the presence of the *pontifex* and *flamen Dialis* with ten witnesses. The *coemptio* again was a symbolic sale in which the father delivered his daughter to her husband as a piece of property, she at the same time declaring her consent. In the betrothal the bridegroom gave the bride earnest-money, as in other cases of contract, or a ring in its stead. The *usus* resembled our *handfasting*, the only thing required being that the woman should live a year in the man's house without absenting herself from his bed for three nights.

Our modern 'best-man' is no doubt the survival of the bridegroom's best helper in the act of capture. In the good old times there were many hearty wedding customs now considered almost as indecorous as Squire Western's jokes would be, such as the struggle for the bride's garters, the drinking of healths in the bridal chamber, the singing of boisterous and appropriate songs outside the door, and the like. The throwing of rice is not an indigenous English custom, and has displaced the strewing of herbs, flowers, and rushes on the way to church. The giving of garlands, gloves, and the like has fallen into disuse; but knots and favours are still used symbolic of indissolubility; and the ring and bridescake retain their place, oldest and most universal of our wedding customs. The wedding-feast was sometimes protracted for a week, and it was formerly the universal custom amongst the poor for the guests to bring contributions of all kinds in what were called *penny-weddings*, so that the young couple not only saved the expense of the feast, but had something over on which to begin housekeeping. The modern custom of giving presents is a survival of a time when such were more immediately useful than they now often are. Many minor customs are observed in different corners of the kingdom, governing the whole order of procedure, and these it is necessary to respect in order to ensure success in the enterprise. Thus in Shropshire the bride must be dressed entirely in new clothes, of any colour but green, without even a pin that she had ever used before; although elsewhere it is lucky to wear something already worn by a happy bride. Often the bride's father does not go to church; the mother never does. Great pains used to be taken to select a favourable day—the importance of this we see in the dislike to May (q.v.), or again in the Bedouin preference for Friday, the Chinese for spring or the last month in the year. In olden times the actual sale of wives was not unknown in England, and we are told that the second Duke of Chandos bought his second wife in 1744 from her husband, an ostler in Newbury, who was offering her for sale as the duke passed through the town. See FAMILY, MARRIAGE, HANDFASTING, BRIDE, RING, JUS PRIMÆ NOCTIS.

Wedge, one of the mechanical powers, in principle a modification of the Inclined Plane (q.v.). The power is applied to the back of the wedge by pressure or, more usually, by percussion. Familiar examples of its use are the splitting of wood, the fastening firmly of the handle of an axe, the raising of a ship in a dry-dock, &c. Axes, nails, plugs, planes, chisels, needles, and all sharp-pointed instruments are examples of the single wedge.

Wedgwood, JOSIAH, the creator of British pottery as an art, was born at Burslem, Staffordshire, 12th July 1730. His father was a potter, and at ten he was set to work at the same business, his education being of the scantiest. After an abortive attempt to settle himself at Stoke with a partner named Harrison, in 1759 he returned to his native place, and there commenced business as a potter. From the first his ardour for the improvement of the manufacture was conspicuous. His earliest efforts were directed to the refining of the material, and in 1763 he took out a patent for a beautiful cream-coloured porcelain, which became popularly known as Queen's Ware, Queen Charlotte having much admired it, and extended her patronage to the manufacturer. Subsequently, other improved materials were produced. The attention of Wedgwood was not less assiduously directed to considerations of form and decoration; he busied himself in emulating the grace of the antique models; and the celebrated sculptor Flaxman was from 1775 employed to furnish designs for his 'Wedgwood ware'—white cameo reliefs on a blue ground and the like. In this way what he found a rude and barbarous manufacture he raised to the level of a fine art; and he found his reward in the amassing of a fortune of upwards of half a million. In 1769 he had removed his works some little way from Burslem; and to the new site he gave the fanciful name Etruria, as that of the country of old most celebrated for the beauty of its ceramic products. Here he built himself a splendid mansion; and here he died, 3d January 1795.

Apart from his eminence in the art to which he mainly devoted himself, Wedgwood was a man of considerable culture. Natural philosophy, in particular, he studied with much success. He was a fellow of the Royal Society, as also of the Society of Antiquaries; and to the *Philosophical Transactions* he from time to time contributed papers. He likewise interested himself deeply in all matters of public concernment; and mainly through his influence it was that the Grand Trunk Canal, uniting the waters of the Mersey, the Trent, and the Severn, was carried out. He was a man of much benevolence and of an almost princely liberality.

See Llewellen Jewitt, *The Wedgwoods* (1865); the Life by Eliza Meteyard (2 vols. 1866); three other works by her (1872-73); Mr Gladstone's *Gleanings* (1879); F. Rathbone, *The Masterpieces of Old Wedgwood Ware* (1892-93); the Life by S. Smiles (1894); also the articles POTTERY, p. 367, and PORTLAND VASE.

Wedmore, a village and parish (pop. 3060) of Somersetshire, 8 miles WNW. of Wells. Here the peace of Wedmore was signed in 878 between King Alfred (q.v.) and Guthrum the Dane. See Prof. Earle's *Peace of Wedmore* (Oxford, 1878).

Wednesbury (locally *Wedgebury*), a municipal and parliamentary borough in the south of Staffordshire, 8 miles NW. of Birmingham. Crowning a hill at the north end of the town is the cruciform Perpendicular church of St Bartholomew, supposed to occupy the site of a temple of Woden—whence the Anglo-Saxon name, *Wodnesbeorh*. It seems to have been built in the 11th, and rebuilt in the 15th century, and was much altered and restored between 1766 and 1885. Here, too, in 916 the Princess Ethelfleda, Edward the Elder's sister, founded a castle. Modern buildings are the town-hall (1872), public baths and free library (1878), and art gallery and museum (1891), with a collection of modern paintings, the gift of a local benefactor, valued at £10,000. One of the great iron towns of the Black Country, in a district abounding in coalpits, ironworks, railways, and canals, Wednesbury has manufactures of boiler-plates, bar-iron, steel, railway ironwork, gas and steam tubes, edge tools, &c. In 1886 it was incorporated as a municipal borough, and in 1867 was made a parliamentary borough, returning one member, and till 1885 including West Bromwich (q.v.). Pop. (1851) 11,914; (1881) 24,566; (1891) 25,342; of parliamentary borough (1891) 69,083. See the *History of Wednesbury* (Wolv. 1854).

Wednesday, the fourth day of the week, the *Dies Mercurii* of the Romans, the *Mittwoch* ('mid-week') of the modern Germans. The Anglo-Saxon form was *Wódnes dæg;* the Dutch, *Woensdag;* Swedish and Danish, *Onsdag*.

Weed, a popular name for any sudden illness, cold, or relapse with febrile symptoms in women after confinement or nursing, especially Milk-fever (q.v.) and inflammation of the Breasts (q.v.).—In horses Weed, or Shot of Grease (Lymphangitis), consists in inflammation of the large absorbent glands and vessels situated between the horse's thighs, occurring particularly after a day or two of rest, after exposure to cold, or during imperfect action of the bowels. See VACCINATION.

Weed, THURLOW, journalist, was born at Cairo, New York, November 15, 1797, was employed as a lad in several printing-offices, served as a private in the war of 1812, and afterwards edited newspapers in Western New York, until in 1830 he founded the Albany *Evening Journal*, an anti-Jackson, Whig, or Republican paper, which became the organ of the party, and which he controlled for thirty-five years. He was a leading party manager, and exercised almost supreme influence in nominations and appointments, while declining all offices for himself. In 1867–68 he was editor of the New York *Commercial Advertiser*. He died 22d November 1882. See his *Autobiography* (1882; vol. ii., by his grandson, 1884).

Weeds, the name given to all those plants which grow wild in cultivated grounds, and injure the crops; which they do both by choking them and by exhausting the soil. Those weeds which are annuals or biennials, as charlock, yellow rattle, and melilot, may gradually be got rid of by merely cultivating, for a succession of years, such plants as are to be cut before the seeds of the weeds are fully ripe. Perennial weeds, such as couch-grass, can only be removed from the ground by repeated and careful tilling; and for this purpose crops which require much hoeing are advantageously planted, and recourse is had to summer fallowing (see FALLOW) in fields, and frequent weeding in gardens. Thistles and other large weeds are frequently pulled in cornfields before the corn comes into ear, and to prevent their seeding they are cut in pastures. Sedges and rushes, which spring up in great abundance in damp grounds, disappear on thorough draining. Leafy crops which thickly cover the soil prevent the growth of many weeds by the exclusion of air and light. Weeds which have been rooted up form excellent compost for manure. Those which make their appearance in fallow grounds serve for green manuring when they are ploughed down. Cultivated grasses growing in arable fields are weeds there. The seeds of weeds are carried normally by the wind, but may be conveyed by running streams. Weeds are often sown along with crops, the seed being imperfectly cleaned; and they are often spread by manure, conveyed by the droppings of birds, or in the mud clinging to the feet of men and animals. Weeds spread far and near from ill-cleaned hedgerows. Weeds transferred to new countries sometimes grow more luxuriantly than at home; thus the Anacharis (q.v.) from America almost chokes up ditches and canals in England, and the thistle from Britain is a ruinous pest in some parts of Australia.

Week designates generally a period of seven days. It was probably first instituted as a kind of broad subdivision of the periodical month, corresponding to the four quarters of the moon, or about $7\frac{3}{8}$ days. Neither this civil division of time nor its application to sacred things was originally solely Jewish, but we find the earliest Jewish cosmogony and legislation closely connected with it. The older of the two accounts of the creation (Gen. ii. 4 *et seq.*) does not recognise the six days' work, and indeed we may assume the connection between the seven days' week and the work of creation as an accommodating generalisation of later days with the symbolic number *Seven* (q.v.). The Sabbath is emphatically the day of rest, while seven weeks after the Passover the Pentecost or Feast of Weeks takes place. The Egyptians at an early period counted seven periodical days, naming them according to the seven planets. The application of the names of the planets to the days of the week in the order they now stand originated in this way: it was an astrological notion that each planet in order presided over an hour of the day, the order, according to their distances from the earth, being, on the geocentric system, Saturn, Jupiter, Mars, the Sun, Venus, Mercury, the Moon. Assuming Saturn to preside over the first hour of Saturday, and assigning to each succeeding hour a planet in order, the 22d hour will fall again to Saturn, the 23d to Jupiter, the 24th to Mars, and the first hour of the next day to the Sun; in the same way the first hour of the following day falls to the Moon, and so on. From Alexandria this seven days' week was imported, together with the names of the individual days, to the Greeks—who previously divided their months into three decades—and to the Romans about the time of Christ. Rome had previously counted her periods by eight days, the eighth day itself being originally called *Nundinæ*—a term later applied to the whole cycle—as returning *nono quoque die*, when the country-people were in the habit of coming to town for the purposes of business, and chiefly to inquire after public news, the changes in government and legislation, vacant places, and the like. But the seven days' cycle soon found great favour among the Romans, owing partly perhaps to the spread of Egyptian astrology, although the change was not officially introduced before Constantine. It is certain that the Jewish name Sabbath came into use in Rome, and from Rome it spread to all the Romance languages, and even into the Teutonic. In the same manner the Latin *Septimana* (the Greek *hebdomas*) has become the modern designation for week in the Italian *Settimana*, Spanish *Semana*, and French *Semaine*. The *Codex Theodosianus* is the first document which adopts the term *Septimana* in the meaning of 'week.' The Jews, as well as the early Christians, had no special names for the single days, but counted their number from the previous Sabbath, beginning with Sunday, as the first after the Sabbath, and ending with Friday, as the sixth after the previous or eve (*Ereb*) of the next Sabbath. After a very short time, however, young Christianity, which in the same manner had endeavoured to count from the *feria secunda*, or second day after Sunday, to the *Septima* (or Saturday), had to fall back again upon the old heathen names, previously introduced in Gaul, Germany, &c. by the heathen Romans. The Sunday, or *dies Solis*, alone was changed in many of the Romanic languages in accordance with the new creed. It was called *Kyriake*, *dies Dominiens* or *Dominica*, the 'Day of the Lord,' a term which in Italian became *Domenica*, in Spanish *Domingo*, and *Dimanche* in French. It is very curious to notice how the names of the five days of the week which followed those named after the sun and moon became Germanised, as it were, or the names of the originally imported gods translated into those of the Germanic divinities. Quakers disapprove of the heathen names, and name the days 'First Day,' 'Second Day,' &c. The Arabs, like the Jews, count their days, beginning and ending with sunset, by sevens, without giving them planetary names. Greeks, Slavs, and Finns also count their days from Sunday, instead of naming them. The French Revolution altered the seven days' week into a decade of ten days; but the new computation introduced in 1793 was abrogated again in 1805. The 'weeks of years,' in Hebrew prophetical poetry (like the Roman *annorum hebdomadæ*), indicate cycles of seven years.

See CALENDAR, SABBATH; and Ideler's *Chronologie* (1831); Grimm's *Deutsche Mythologie* (1835); and Lenormant's *La Magie chez les Chaldéens* (1874); and for the Feast of Weeks, see FESTIVALS.

Weems. See EARTH-HOUSES.

Weever, or Sting-fish, a genus of fishes (Trachinus), of which two species, the greater (*T. draco*), 12 or 13 inches long, and the smaller (*T. vipera*), are both British, and are esteemed for the table. They have sharp dorsal and opercular spines, with which they can inflict serious wounds.

Weever, John (1576–1632), author of *Ancient Funerall Monuments* (1631 ; 3d ed. by Tooke, 1767), was a native of Lancashire, studied at Queen's College, Cambridge, and died in London.

Weevil, a popular name for a large number of beetles, marked by the prolongation of the anterior part of the head into a beak or proboscis, generally used by the females as an ovipositor, and by both sexes as a boring organ. They were formerly ranked in one family Curculionidæ, but Le Conte constituted them a special group with the title Rhynchophora, and divided them into several families—Curculionidæ, Scolytidæ, Brenthidæ, and Anthribidæ. According to some authorities there are about 30,000 species ; and most would allow at least half that number. With few exceptions the footless grubs are destructive to plants. The Curculionidæ are compact weevils, with very hard wing-covers, and with a downward-pointing beak or proboscis, bearing the antennæ on its sides and the mouth-parts at its end. Their scales are often very brilliant. With few exceptions they devour plants—roots, stems, leaves, fruits, seeds, or, in fact, any part. Among the 10,000 described species are : *Calandra granaria*, whose larvæ feed on stored grain ; *C. oryzæ*, attacking rice, wheat, and maize ; various species of Rhynchophorus, whose large, fleshy, white larvæ, known as palm-grubs or *grugru*, are sometimes eaten ; Balaninus, whose mandibles, unlike those of other beetles, move vertically, whose larvæ are hatched in chestnuts, hazel-nuts, acorns, and the like ; *Trichobaris trinotata*, a little black weevil, which destroys potatoes in America ; *Anthonomus pomorum*, often destroying apple-blossom in Britain ; *Conotrachelus nenuphar*, which lays its eggs in nectarine, plum, apricot, peach, and other stone-fruit, and is a great pest in America ; *Cionus scrophulariæ*, whose larvæ spin cocoons remarkably similar to the capsules of *Scrophularia nodosa*, which the insect usually infests ; Pissodes, whose larvæ attack pines ; *Phytonomus punctatus*, a clover weevil, introduced from Europe into America ; *Entimus imperialis*, the diamond-beetle, with very brilliant scales. Species of the likewise brilliant Rhynchites attack fruit-trees ; species of Apion especially affect vetches ; and those of Larinus infest Compositæ.

The Scolytidæ are very small weevils, some almost microscopic, which, both as larvæ and as adults, bore in wood and bark of trees, especially Coniferæ, and occasionally attack herbaceous plants (see Bark Beetles). The Brenthidæ are much elongated weevils, mostly tropical, usually infesting bark, and notable for the combats of the rival males, which are larger and better armed than their mates. Brenthus and Eupsalis are representative genera. Among the Anthribidæ *Cratoparis lunatus*, common in the eastern United States, feeds on the fungi of dead trees ; and the larvæ of Brachytarsus are even more aberrant in their habit, for they are parasitic on female coccus-insects. The seed-inhabiting 'weevils' or Bruchidæ, which do much damage to the seeds of leguminous plants, within which the larvæ hatch and pupate, were excluded by Le Conte from his group Rhynchophora, and placed near the Chrysomelidæ. Both in Europe and America *Bruchus pisi*, *B. rufimanus*, &c. are destructive to peas and beans, but the common pea-weevil in England is *Sitones lineatus*, one of the Curculionidæ.

The most important British weevils are probably the following : *Anthonomus pomorum* on apple-blossom ; *Apion apricans*, &c. on clover ; *Bruchus rufimanus* on bean-seed ; *Hylesinus fraxini* ; *Hylurgus piniperda* ; species of Otiorhynchus on vines, raspberries, strawberries, &c. ; *Scolytus destructor* ; *Sitones lineatus*. For preventing or lessening the attacks of these pests, see Miss Ormerod's *Manual of Injurious Insects* (2d ed. 1890).

See *Riverside* or *Standard Natural History* ; Le Conte and Horn in *Proc. Amer. Phil. Soc.* (xv. 1876).

Wegscheider, Julius August Ludwig, rationalistic theologian (1771—1849), became professor of Theology at Rinteln in Hesse, and in 1810, at Halle. His chief work was the *Institutiones theologicæ dogmaticæ* (1815).

Weighing-machines, contrivances for ascertaining the weight of any object, the name being, however, specially appropriated to those used for large and heavy objects, as large bales, casks, laden carts or vehicles, cattle, &c. ; while those employed for finer purposes are called balances. The large and cumbrous ones are usually modifications of the principle of the steel-yard. See Balance.

Weights and Measures. Of the earliest standards of length the principal were the palm or handbreadth, the foot, and the cubit (from elbow to tip of mid-finger). There were two leading cubits : the natural cubit in Egypt, Chaldea, Phœnicia, and Greece = 6 palms = 2 spans = $1\frac{1}{2}$ foot = 18·24 inches ; and the royal cubit of Memphis, found also in Babylonia and Chaldea = 20·67 inches. The Greek foot (= 12·16 inches) passed into Italy and was there divided into 12 unciæ (inches) ; it was afterwards shortened, becoming as small as 11·65 inches. The Romans used a 3-foot *ulna*. The Saxons used an ell or yard of 36 inches, based on the Roman foot. This was continued by the Normans in England, various modifications occurring in the ell. Henry VII. and Elizabeth made standard yards of 36 inches : Henry's was 35·963 inches of the present standard ; Elizabeth's was about $\frac{1}{10}\frac{1}{0}$ inch short of the present yard. In 1742 the Royal Society of London made a standard 42-inch scale ; in 1760 Mr Bird made for a Weights and Measures Committee of the House of Commons a copy of an old yard-measure found in the Tower. In 1824 (5 Geo. IV. chap. 74) this copy was legalised as the standard yard, with the direction that in the event of its being lost, the standard was to be recovered by making the length of a mean-time seconds pendulum in the latitude of London, in a vacuum at sea-level equal to 39·1393 inches. In 1834 the standard was destroyed in the fire at the Houses of Parliament. In 1838 a committee was appointed under Mr Airy, astronomer-royal ; in 1841 they reported against the accuracy of the pendulum-method ; in 1843 they were appointed as a commission to restore the lost standards ; this they did between 1843 and 1854 by taking the best secondary evidence, and they produced a standard bar of gun-metal, the distance between two lines on which, crossing two gold studs, is one yard at 62° F. and 30 inch bar. pressure. This was legalised as the standard by 18 and 19 Vict. chap. 72. Parliamentary copies are lodged at the Mint, the Royal Observatory, Greenwich, with the Royal Society of London, and immured in the parliament buildings, Westminster ; while copies have been supplied to many towns. The Weights and Measures Act of 1878 (41 and 42 Vict. chap. 49) regulates the law, renders all old local or customary weights and measures, other than imperial ones, illegal, and enacts penalties on false and unverified weights and measures varying from £5 to £50.

Two-thirds of a cubit, we have seen, made a

'foot;' a cubic 'foot' of water weighed a talent. When the 'foot' was $\frac{2}{3}$ the royal cubit, the talent was 655,566 grains; this was the Egyptian, Hebrew, and Olympic monetary talent, later known as the great Alexandrian talent of brass and the Egypto-Roman talent. A talent half this weight was known as the Alexandrian talent of silver, or 327,783 grains; this was divided into 60 minas of 5463 grains each; these are the origin of the Saxon moneyer's lb. of 5400 grains = Mint lb. or Tower lb. = old apothecaries lb. of Germany; one such lb., in silver coins, was the original form of 'one £ sterling,' and was divided into 20 'shillings,' or 240 'pence' or pennyweights; each dwt. was divided into 32 monetary grains (wheat-grains), each equal to 0·703125 modern grain. The Tower weight was abolished in 1527. The Saxon ounce contained 416·5 grains = nearly, Roman uncia = $\frac{1}{12}$ libra; the libra (= 5015 grains) was the Greek-Asiatic and Persian mina of 5015 grains. The Troy lb. is 5760 grains = 12 oz. of 20 dwt. each. Troy weight is now restricted to gold, silver, and jewels, except diamonds and pearls; the latter are weighed in carats (= 3·1683 grains), which were originally $\frac{1}{144}$ the Alexandrian ounce (the twelfth part of the mina of silver). Various larger lbs. were early used for merchandise; in 1303 the 'avoirdupois' lb. (= 7000 grains) was in use. The Troy lb. standard made by Mr Bird in 1758 for the Weights and Measures Committee was legalised in 1824; in 1834 the standard was destroyed; the Standards Commission replaced troy weight by avoirdupois, and the standard lb. is a mass of platinum weighing 7000 grains *in vacuo*, copies of which are distributed as in the case of standards of length. The standard of capacity is the gallon, which was in 1824 adjusted so as to contain 70,000 grains, or 10 lb. avoirdupois of water at 62° F. and 30 inches bar. pressure; this gallon occupying 277·274 cubic inches, instead of the old Winchester gallon of 274¾ cubic inches. The French or Metric system of weights and measures is based on the Decimal System (q.v.); and see METRE, ARE, GRAMME, LITRE.

See Chisholm's *Weighing and Measuring*, Kelly's *Universal Cambist*, Tate's *Modern Cambist*, Whiteley's *Law of Weights and Measures*, Ridgeway's *Origin of Metallic Currency and Weight Standards* (1892); the articles on the various measures; also AVOIRDUPOIS, DEGREE, GRADUATION, GRAVITY, TROY WEIGHT, UNITS, &c.

Wei-hai-wei. See PORT ARTHUR.

Weil, GUSTAV, orientalist (1808–89), was of Jewish descent. He studied in Germany, Paris, and the East, and became (1838) librarian and (1861) professor of Oriental Languages at Heidelberg. His chief works are a Life of Mohammed from Arabic sources (1843), histories of the califs (1846–62) and of the Islamitic peoples (1866), &c.

Weimar, a small but interesting town of Germany, capital of the grand duchy of Saxe-Weimar-Eisenach, and residence of the grand-duke, 31 miles E. of Gotha and 155 SW. of Berlin. It stands in a pleasant valley on the left bank of the Ilm; but the environs are in no way remarkable, and the town itself is irregularly and rather poorly built. Though the residence of the court, Weimar carries on neither trade nor manufactures, and seems a dull, provincial-looking town. The lustre conferred on it by the residence here, at the close of the 18th and the earlier portion of the 19th century, of Goethe, Schiller, Herder, and Wieland, at the court of Karl-August, has faded since that group was broken up by death; and now the interest of the place (Thackeray's 'Pumpernickel') is almost wholly derived from its monuments, traditions, and associations. The town church (*Stadtkirche*), dating from the year 1400, has a 'Crucifixion' by Cranach, and contains a number of memorable tombs, among which are those of Bernhard of Weimar and Herder. The ducal palace, rebuilt in 1790–1803 after the fire of 1774, is a handsome building, some of the apartments of which are decorated by frescoes illustrating the works of Goethe, Schiller, Herder, and Wieland. Other buildings are the Rothes Schloss (1574); the Grünes Schloss, with a library of 180,000 volumes, and relics of Luther and Gustavus Adolphus; the court theatre (rebuilt 1825), where Liszt produced Wagner's *Lohengrin;* and the houses of Cranach, Goethe, Schiller, and Herder. The park and gardens of the palace, within which is the summer residence of Goethe, are much esteemed as a promenade. Pop. (1871) 15,998; (1890) 24,546. See works by Schöll (1857), Gräf (3d ed. 1880), Springer (1868), and Francke (1886).

Weir, HARRISON WILLIAM, book-illustrator, painter, and wood-engraver, was born at Lewes on the 5th May 1824. From about 1845 he exhibited at the Royal Academy and elsewhere pictures of birds and animals. But he is best known by his drawings and wood-engravings in the *Illustrated News, British Workman, Band of Hope Review, Chatterbox, Pictorial Times, Field, Graphic, Black and White;* in various books of natural history and poultry; and in a series of works written by himself, *Animal Stories, Bird Stories, Our Cats,* &c.

Weismann, AUGUST, biologist, was born in 1834 at Frankfort-on-the-Main, in the lyceum of which city his father was professor of philology. He was educated at the gymnasium till his eighteenth year, studied medicine at Göttingen, and in 1860 became physician to the Archduke Stephen of Austria. This appointment secured time for zoological pursuits, the first outcome of which was a treatise on the *Development of the Diptera.* Impaired sight compelled abandonment of microscopical work for some years, and Weismann turned to the study of the problem of variability of organisms, on which the doctrine of descent with modification is based. The results of this, drawn mainly from observations on caterpillars and other insects exhibiting metamorphosis, appeared in a series of papers issued between 1868 and 1876, of which an English translation by R. Meldola, with prefatory note by Darwin, was published in 1882 under the title of *Studies in the Theory of Descent.* But it is round the answer which Weismann, after many years of research, has given in his *Essays upon Heredity and Kindred Biological Problems* (Eng. trans. vol. i. 1889; 2d ed. 1891; vol. ii. 1892) to the question 'How is it that a single cell of the body can contain within itself all the hereditary tendencies of the whole organism?' that interest and controversy have gathered. In all theories of Heredity (q.v.) biologists have assumed that characters acquired by the individual are transmitted to offspring. This Weismann denies, and, while biologists have concerned themselves with speculation as to the mode by which such transmissions are effected, he challenges them to prove that they are effected at all. The *onus probandi* is thus thrown upon his opponents, whose assumptions must give way to experimental evidence, which alone can determine, and that only after protracted record of cases, whether individually-acquired characters are transmitted or not.

Death, he contends, is not a primary attribute of living matter; the Protozoa, or one-celled organisms, being immortal in so far that they do not die naturally. The Protozoon, a microscopic, jelly-like, apparently—not really—structureless mass, with no seeming unlikeness of parts, multiplies by division. Each half becomes a complete individual, and grows in like manner as the whole to which it belonged, till it also divides, and so on with the

multiplication of Protozoa *ad infinitum*. It cannot be said of either half that one is parent and the other offspring, for both are of the same age, and only, in a limited sense, as the subdivisions into separate individuals are repeated, can we speak of succession of generations. In these processes there is nothing analogous to death. 'There are,' Weismann says, 'no grounds for the assumption that the two halves of an amœba are differently constituted internally, so that, after a time, one of them will die while the other continues to live. Observations show that when division is almost complete the protoplasm of both parts begins to circulate, and for some time passes backwards and forwards between the two halves. A complete mingling of the whole substance of the animal, and a resulting identity in the constitution of each half, is thus brought about before the final separation' (*Essays*, p. 26, 1st ed.). Consequently, there is unlimited persistence of the individual; potential, although not absolute, immortality so long as life lasts on the earth.

While the one-celled organisms are thus immortal, only the reproductive cells of the Metazoa, or many-celled, are immortal. How has this come about? Weismann accounts for it by the failure of certain Protozoa to divide equally, whereby unlikeness of parts and differences of position of parts resulted. 'The first multicellular organisms were probably clusters of similar cells, but these units soon lost the original homogeneity. As the result of mere relative position there arose division of labour, some of the cells were especially fitted to provide for the nutrition of the colony, while others undertook the work of reproduction' (*Ib.* p. 27). Clearly, those on the outside, being exposed to the direct and constant action of their surroundings, would be the media of nutrition, and the builders-up of the cell-commonwealth. So the result of this cell-clustering would be that the cells fell into two classes, body cells and germ-cells. While the body cells were solely concerned with the nutrition of the organism, losing in this specialisation of function the power of reproduction, that power became concentrated in the germ-cells, or, speaking more precisely, in the germ-plasm, which is located in the nucleus of the germ-cell. It is these germ-cells which are the immortal part of the Metazoa. 'It is necessary to distinguish between the mortal and immortal part of the individual—the body (*soma*) in its narrow sense—and the germ-cells. Death affects only the former; the germ-cells are potentially immortal, in so far as they are able, under favourable circumstances, to develop into a new individual' (*Ib.* p. 122). With increasing subdivision of function there has been increasing modification of the organism, but the twofold classification of the somatic or body cells and the germ-cells has remained. The death of the body cells is involved in the ultimate failure to repair waste, because a worn-out tissue cannot for ever renew itself, and because cell-division has its limits. In brief, death is the penalty paid for complexity of structure. As it is impossible for the germ-cell to be, as it were, an extract of the whole body, and for all the cells of the body to despatch particles to the germ-cells whence these derive their power of heredity (the fundamental idea of Darwin's theory of Pangenesis), the germ-cells, so far as their essential and characteristic substance is concerned, are not derived from the body of the individual, but directly from the parent germ-cell. Heredity, Weismann contends, is secured by the transference from one generation to another of a substance with a definite chemical and molecular constitution—in other words, by the 'continuity of the germ-plasm.' This germ-plasm (which, Weismann's critics argue, runs perilously near a metaphysical concept) is assumed to possess a highly complex but extremely stable structure, so stable 'that it absorbs nourishment and grows enormously without the least change in its complex molecular structure' (*Ib.* p. 271). Of this germ-plasm it is further assumed that a small portion contained in the parent egg-cell is not used up in the construction of the body of the offspring, but is reserved unchanged for the formation of the germ-cells of the following generations. 'One might represent the germ-plasm by the metaphor of a long creeping root-stock from which plants arise at intervals, these latter representing the individuals of successive generations' (*Ib.* p. 266).

Only variations of the germ-plasm itself are inherited, and it is upon these variations that natural selection operates. Variations are due not to the influence of external condition nor to use or disuse of organs, but to sexual conjugation. This process combines two groups of hereditary tendencies derived from the mingled germ-plasms of the male and female parents, resulting in those individual differences which form the material from which new species are produced by the action of natural selection. Those differences multiply in geometrical ratio, so that 'in the tenth generation a single germ contains 1024 different germ-plasms with their inherent hereditary tendencies, and, as continued sexual reproduction can never lead to the reappearance of exactly the same combinations, new ones must always arise' (*Ib.* p. 276).

So the sum of the matter is that natural selection is the dominant factor, that use and disuse of parts and the action of the environment count for nothing, or, at the most, for but a little. Here and there Weismann makes concessions as to the modifying influences of body cells on the germ-cells (*Ib.* p. 170), and as to the ultimate origin of hereditary individual differences in the direct action of surroundings (*Ib.* p. 279), which are a partial surrender of his main contention as to the isolation of the germ-plasm. The vulgar notions concerning the transmission of mutilations and developments of non-vital parts are altogether without evidence, as are the beliefs in coincidence between maternal shocks and impressions and 'birth-marks,' and other malformations in the offspring; but the case is altered when we deal with subtle processes initiating changes in vital parts. It is not easy to reconcile the theory of an insulated 'germ-plasm' with the ceaseless manufacture, secretion, and expulsion of germ-cells, the materials of which are derived from the materials nourishing the entire organism; nor with the subtle influence of the nervous system on the reproductive organs. The chief arguments against Weismann's theory are summarised in the article on Heredity (q.v.), but perhaps the most serious difficulty is in the reconciliation of psychological evolution with the continuity of the germ-plasm. For the researches of Spencer, Balfour, and others have demonstrated that the nervous system had its origin in modifications of the primitive skin due to the direct action of the environment.

Be this as it may, the wide-reaching sociological significance of the doctrine of Heredity—which may be regarded as the physical correlate of Determinism—gives an importance to the labours of Weismann that cannot be overrated, and makes urgent the record of extended observations on the lines already laid down by Galton.

For bibliography of subject, see list of books at end of article HEREDITY, also the articles DARWINIAN THEORY, VARIATION, and cognate articles in this work; Weismann's *Essays* (1892) and *The Germ Plasm* (1893); G. J. Romanes, *An Examination of Weismannism* (1893); Herbert Spencer, *A Rejoinder to Professor Weismann* (1894); and numerous articles in *Nature*.

Weiss, BERNHARD, a learned German theologian, was born at Königsberg, 20th June 1827, studied at Königsberg, Halle, and Berlin; became *privat-docent* at Königsberg in 1852, and professor extra-ordinary in 1857; and was called to a chair at Kiel in 1863, to Berlin in 1877, where also in 1880 he became superior consistorial councillor and adviser to the government in spiritual concerns. Of his numerous works three stand among the first in importance of their time: *Lehrbuch der biblischen Theologie des Neuen Testaments* (1868; 5th ed. 1888; Eng. trans. 2 vols. 1882–83), a book unequalled in grasp and insight; *Lehrbuch der Einleitung in das Neue Testament* (1887; Eng. trans. 1887–88), the fullest and best orthodox book on the subject; and *Das Leben Jesu* (1882; Eng. trans. 3 vols. 1883–84), a work neither closely knit in argument nor altogether happy in exposition, yet perhaps, on the whole, the most satisfactory bulwark that has been raised to defend the faith in the cardinal fact of Christianity against its assailants. His earlier books on the Petrine theology (1855), Philippians (1859), the theology of John (1862), Mark (1872), and Matthew (1876) prepared the way for these. Weiss has also prepared the newest editions of Meyer's commentaries on Matthew (1883), Mark and Luke (1878 and 1885), John (1886), Romans (1887), the Pastoral Epistles (1885), the Epistles of John (1888), and Hebrews (1888). His work on the Revelation appeared in 1891; that on the Catholic Epistles in 1892.

Weissenburg. See WISSEMBOURG.

Weissenfels, a town of Prussian Saxony, 35 miles SW. of Leipzig, with miscellaneous manufactures (see FURS) and a pop. (1890) of 23,909.

Weitbrecht, GOTTLOB FRIEDRICH, theologian, was born at Culm, 4th June 1840, studied at Tübingen, and after travels in England and Scotland, and a considerable experience in teaching, settled in 1885 as pastor in Stuttgart. Of his numerous writings need only here be named *Das Leben Jesu* (2d ed. 1883); *Unser Glaube* (1888); *Die Sittlichkeit des Mannes Ehre* (1889).

Weizsäcker, KARL, an eminent German theologian, was born at Oehringen near Heilbronn, December 11, 1822, studied at Tübingen and Berlin, and became successively *privat-docent* in theology at Tübingen (1847), preacher (1848), court-chaplain in Stuttgart (1851), superior consistorial councillor (1859), and successor to Baur in the theological faculty at Tübingen (1861). He edited the *Jahrbücher für Deutsche Theologie* from 1856 to 1878, and made his name widely known by the profound learning and unusual lucidity of his *Untersuchungen über die evangelische Geschichte* (1864) and *Das apostolische Zeitalter* (1886–89). Other writings are on the epistle of Barnabas (1863), on the Tübingen theological faculty (1877), and a new translation of the New Testament (1875). He died 13th August 1899.—His brother, JULIUS WEIZSÄCKER, historian, was born at Oehringen, 13th February 1828, studied theology at Tübingen, but early gave himself to historical studies at Berlin and Paris, habilitated as *privat-docent* in history at Tübingen, and filled chairs successively at Erlangen (1864), Tübingen (1867), Strasburg (1872), Göttingen (1876), and Berlin (1881). He died at Kissingen, 3d September 1889. Already he had written on the origin of the Pseudo-Isidorian decretals, when in 1860 he was called to Munich to undertake under Sybel's direction the editing of the *Deutsche Reichstagsakten*, which the then sitting Historical Commission had determined to publish. Of this vast work he lived to edit six volumes (1867–87; i.–iii., those under King Wenzel; iv.–vi., those under King Ruprecht, 1376–1410).

Welbeck Abbey, the seat of the Duke of Portland, in Nottinghamshire, 3 miles S. of Worksop. Occupying the site of an old Premonstratensian abbey, it came from 'Bess of Hardwick' to her son Sir Charles Cavendish, the father of the first Duke of Newcastle, whose far-away heiress married in 1734 the second Duke of Portland. It stands in a park 10 miles in circumference, and is a stately Palladian edifice of mainly the 17th and 18th centuries, but was greatly enlarged about 1864 by the fifth duke, to whom it owes its semi-underground picture-gallery, ball-room, and riding-school, the last 385 feet long, 104 feet wide, and 51 feet high.

Welcker, FRIEDRICH GOTTLIEB, a great German scholar, was born 4th November 1784 at Grünberg, in Hesse-Darmstadt, studied at Giessen, spent the years 1806–7 in Rome, filled a chair at Giessen, fought against the French as a volunteer in 1814, spent the following winter in Copenhagen writing the life and editing the remains of Zoega, was next called to a chair at Göttingen, and finally (1819) in the newly-erected Prussian university of Bonn, where he laboured till his death, 17th December 1868. His chief works are *Die Aeschyleische Trilogie* (1824–26); *Die Griech. Tragödien mit Rücksicht auf den epischen Cyklus* (3 vols. 1839–41); *Der epische Cyklus oder die Homerischen Dichter* (2 vols. 1835–49); *Griech. Götterlehre* (3 vols. 1857–63). His *Kleine Schriften* (5 vols. 1844–67) contain his contributions to the *Archäol. Zeitung*, *Rhein. Museum*, &c. See the Life by Kekulé (1880).—His brother, KARL THEODOR WELCKER (1790–1869), was an eminent publicist and Liberal politician, filled chairs at Kiel, Heidelberg, Bonn, Freiburg, and edited with Rotteck the *Staatslexikon* (12 vols. 1834–44).

Weld, or WOOLD, also called Dyer's Rocket, Dyer's Weed, and Yellow Weed (*Reseda Luteola*), is a plant of the same genus with Mignonette (q.v.), a native of waste places in England, very common in Germany and in many parts of Europe. It has an upright stem two to three feet high; lanceolate, undivided leaves; and long racemes of small yellow flowers, with four-partite calyx and prominent stamens. It was formerly much used for dyeing, but has been largely superseded by other dyes (see DYEING). The best is grown in France, England, and Holland. Good weld must have flowers of a beautiful yellow or greenish colour, and should abound in leaves; that which is small, thin-stemmed, and yellow is better than that which is large, thick-stemmed, and green.

Dyer's Rocket (*Reseda Luteola*).

Welding. When iron or steel is raised to a white heat it passes into a pasty condition, and in this state two pieces can be *welded*—i.e. firmly united together by pressure or hammering. The welding of two lengths of bar or plate iron can be effected more easily than can a piece of iron to a piece of steel. Mr D. Kirkcaldy has tested a number of welded tie-rods, plates, chain-links, &c., and finds that the tensile strength of a welded joint does not often exceed three-fourths of that of a solid piece of iron of the same section and

kind. The chain-link welds were, however, an exception to this, some of them being nearly as strong as the solid metal. (See Kirkcaldy's *Strength of Materials*, Lond. 1891.) Iron tubing and other objects have recently been successfully welded by means of the heat of the electric arc, which, however, does not readily admit of an area of more than two square inches being done at a time. (For an account of this method of electric welding, see *Engineering* for December 25, 1891.) Most metals pass too rapidly from the solid to the liquid state to admit of being welded. Horn and especially tortoise-shell among animal substances can be welded when they are softened by heat.

Welhaven. See NORWAY, Vol. VII. p. 534.

Well. See ARTESIAN WELLS, DIVINING-ROD, PUMPS, SPRING, WATER, WELLS.

Welland Canal. See CANAL, p. 699.

Welle, a great river of Equatorial Africa, rising in the Monbuttu country and keeping a mainly westward course to 19° W., where it turns south-westwards, and as Mobangi or U-banghi enters the Congo. Schweinfurth, its discoverer, thought the Welle or Maku joined the Shari, and so fell into Lake Tsad; Stanley held it to be a tributary of the Congo through the Aruwimi; Grenfell proved its connection with the Congo by the Mobangi.

Wellesley, province. See PENANG.

Wellesley, RICHARD COWLEY, MARQUIS, was born in Dublin, June 20, 1760. His father, the first Earl of Mornington (1735–81), was a man of great ability, though chiefly known for his musical attainments. Richard was educated at Eton, then at Christ Church, Oxford, and distinguished himself by his mastery of the classics, and especially by the remarkable excellence of his Latin verse. On his father's death in 1781 he took his seat in the Irish House of Peers, and in 1784 he was returned to the parliament at Westminster as member for Beeralston in Devonshire, sitting later for Saltash and Windsor. He supported Pitt's policy and Wilberforce in his efforts to destroy the slave-trade, and as early as 1786 became one of the Lords of the Treasury, having had the good fortune also to gain the favour of George III. In 1793 he became a member of the English Privy-council and of the Board of Control, and in October 1797 he was selected by Pitt to be Governor-general of India, and raised to the English peerage as Baron Wellesley. At this time the power of England was by no means supreme in India, but at the close of Wellesley's administration in 1805 she had become predominant, the revenue of the company raised from seven to fifteen millions, the foundations of British India securely laid. He cleared out the French from the Peninsula by ordering the Nizam to disband his French contingent of 14,000 men, and sent English soldiers to take their place, and in May 1799 crushed the dangerous power of Tippoo Saib when General Harris took Seringapatam by storm. This year he was made Marquis of Wellesley, and received the thanks of parliament, while later the Court of Proprietors voted him an annuity of £5000. In 1802, mortified by misunderstandings at home, he offered to resign, but was induced to remain because of the threatening clouds on the horizon. The great struggle with the Mahrattas soon broke out, but was closed by the energy of Wellesley and of his younger brother Arthur, afterwards Duke of Wellington. In 1805 Wellesley returned to England, where he never overcame the mortification of finding that he no longer stood first of men as he had done in India. He chafed much under the attacks on his administration which were made in parliament. In 1809 he went as ambassador to Madrid to urge a more vigorous support to his brother in the struggle within the Peninsula against the French, and on his return was made Foreign Minister and a Knight of the Garter. He became Lord-lieutenant of Ireland in 1821 and again in 1833. He died at Kingston House, Brompton, September 26, 1842, and by his own desire was buried in the chapel of Eton College.

See the *Memoirs and Correspondence*, edited by Robert R. Pearce (1846); the *Despatches, Minutes, and Correspondence*, edited by Montgomery Martin (1840); the study by Col. Malleson (1889), and that by W. H. Hutton (1893).

Wellhausen, JULIUS, a learned Old Testament scholar, was born at Hameln, 17th May 1844, studied at Göttingen under Ewald, became *privat-docent* there in 1870, and ordinary professor of Theology at Greifswald in 1872. He resigned in 1882 from conscientious reasons, first became professor extra-ordinary in Philology at Halle, and in 1885 ordinary professor of Oriental Languages at Marburg. He has made his name widely known by his equally able and uncompromising application of the views of Graf and Kuenen to the fundamental problems of Old Testament history.

His books are *Der Text der Bücher Samuelis* (1872), *Die Pharisäer und die Sadduzäer* (1874), *Geschichte Israels* (vol. i. 1878, rewritten as *Prolegomena zur Geschichte Israels*, 1883; Eng. trans. 1885), *Skizzen und Vorarbeiten* (5 parts, 1884–89), *Muhammed in Medina* (1882), and *Die Komposition des Hexateuchs* (1889). Wellhausen also edited the 4th and 5th editions of Bleek's *Einleitung in das Alte Testament* (1878, 1886).

Wellingborough, a market-town of Northamptonshire, on a declivity near the confluence of the Ise with the Nen, 10½ miles ENE. of Northampton. Almost destroyed by fire in 1738, it has a chalybeate spring (the 'Red Well'), said to have been resorted to by Charles I. and Henrietta Maria; a large and imposing parish church (restored 1861–74), mainly Decorated and Perpendicular in style; a corn exchange (1861); a grammar-school (1595), transferred to new buildings in 1880; and important industries of boot-making, iron-smelting, &c. Pop. (1851) 5061; (1891) 15,068.

Wellington, a market-town of Shropshire, 2 miles NE. of the conspicuous Wrekin (1320 feet) and 10 E. of Shrewsbury. It stood near the ancient Watling Street, hence its name 'Watling Town.' Situated in a populous mining and agricultural district, it has some manufactures of farm implements, &c., an Italian town-hall built in 1867 at a cost of £10,000, and a corn exchange (1868). Pop. (1851) 3926; (1891) 5831.

Wellington, a market-town of Somerset, 7 miles SW. of Taunton, near the Tone and the foot of the Black Downs (900 feet), which were crowned in 1817 by a Wellington obelisk. The 'Great Duke' took for some unknown motive his titles from this place; and its manor (held formerly by King Alfred, Asser, Aldhelm, the Protector Somerset, the Pophams, &c.) was purchased for him in 1813. The large Perpendicular church has a Jacobean monument to Chief-justice Popham; and T. S. Baynes was a native. Serges and other woollen goods are manufactured. Pop. (1851) 4601; (1891) 6808. See A. L. Humphrey's *History of Wellington* (1890).

Wellington, the capital of New Zealand, on Port Nicholson, an inlet of Cook Strait, on the southern coast of the North Island, 180 miles by sea from New Plymouth, and 150 miles from Nelson. It was the first settlement of the New Zealand Company, and was planted under the direction of Colonel Wakefield, with a band of pioneer colonists, in 1840. The harbour is a fine

expanse of water, 6 miles long and 5 broad, and has an excellent wharf, affording accommodation to ships of any tonnage. After the removal of the seat of government hither in 1865 the town made rapid progress; it possesses a number of good public buildings, including Government House, Houses of Legislature, government buildings, post-office, college, museum, hospital, and many banks, clubs, theatres, hotels, and insurance offices. The streets are generally wide, and have good dwelling-houses. Wellington is the seat of Anglican and Catholic bishops, and possesses two cathedrals, together with about twenty other places of worship. There is a railway to the interior. Wellington is also connected by steamers with the chief ports of New Zealand, and with Melbourne and Sydney. Amongst the industries are tanning, brewing, candle and soap works, boot-factories, meat-preserving, and shipbuilding. There is a public park, and the botanical gardens have an area of 100 acres. The suburb of Newton or South Wellington is connected by tramway with the older town. Pop. (1888) 28,000; (1891) 31,021, or with suburbs, 33,224.

Wellington, Duke of, the Hon. Arthur Wellesley (or Wesley), was third of the four sons who reached man's estate of Garret, first Earl of Mornington, of Dangan Castle, County Meath, and Anne Hill, daughter of Lord Dungannon. He was born on 29th April 1769, according to a committee of the House of Commons which had to decide, in April 1790, whether or not he was then of age, and therefore eligible to take his seat. But Lady Mornington always insisted that he was born on May-day 1769, and the duke himself kept that day as his birthday, though his baptismal certificate is dated April 30. The place of his birth, too, is somewhat doubtful, but it was probably Mornington House, 24 Upper Merrion Street, Dublin, and not Dangan Castle, as sometimes stated. It is remarkable that the same year produced his great antagonist Bonaparte, and that similar uncertainty exists as to the date of his birth, now allotted to August 15. His three brothers were all men of mark and eminent scholars, but he was for many years considered the dunce of the family, and was by no means a favourite with his mother.

Copyright 1892 in U.S. by J. B. Lippincott Company.

He went first to school at Chelsea and then to Eton, distinguishing himself at neither as regards learning, but gaining some renown at the latter by fighting 'Bobus' Smith, brother of the witty Canon Sydney Smith of St Paul's. From Eton he went to a French military school at Angers for about a year, was 'not very attentive to his studies,' and rather weak in health, but acquired a useful knowledge of the language.

On 7th March 1787 he received his first commission as ensign in the 73d Foot. His eldest brother Richard, Earl of Mornington since his father's death in 1781, watched over him and gave him the benefit of his great political and social influence, so that he soon became lieutenant in the 76th Foot, then in the 41st Foot, and then in the 12th Light Dragoons. From captain in the 58th Foot, he went in 1792 to the 18th Light Dragoons. Then, being promoted into the 33d Foot as major, he purchased the lieutenant-colonelcy of that regiment in September 1793, with money provided by his brother. In the meantime he had served as aide-de-camp to two viceroys of Ireland, Lords Westmoreland and Camden, and entered parliament as member for Trim. In 1796 he became engaged to the Hon. Catherine Pakenham, third daughter of Edward Michael, second Lord Longford; but they were not allowed to marry until 10th April 1806, when he returned from India a major-general and victor in several great battles. Up to 1793, when he assumed command of the 33d Regiment, he had been considered dull, idle, and perhaps frivolous, but he soon showed very different traits, and worked so earnestly and wisely that his regiment was in a few months officially declared to be the best drilled and most efficient in the Irish command. In 1794 a force under Lord Moira was despatched to succour the Duke of York, who, beaten at Oudenarde, was retiring on Antwerp. Here the 33d joined the army, and its commander, who had resigned his seat in parliament in order to lead it, commenced his war service by taking part in a retreat, for the French had cut the allies in two, the Austrians retiring by Maestricht, the British towards Holland. The first engagement in which Arthur Wesley, as he then signed himself, took part was during the retreat of General Abercrombie's brigade from Boxtel, which place they had tried to retake, but without success. The 33d were in support, and by their steady fire, added to the skilful way in which they were handled, were able to beat off the enemy at a very critical moment. Wesley's coolness and promptitude on this occasion were noticed by his superiors, and he was selected to command the rear-guard, and faithfully fulfilled this arduous task. The retreat was made in winter weather of unusual severity, and great privations were endured. The superior officers, too, of this unfortunate expedition were criminally careless and indolent, so that the final escape of the army to its ships in the spring seemed to Wesley almost miraculous. So great was his disgust at the way this affair had been mismanaged that, on reaching his home at Trim, he applied for civil employment, indicating the Revenue or Treasury Board as his preference. But his request was not complied with, and soon after he was ordered with his regiment to the West Indies. They embarked, but after striving in vain for six weeks to get out of the Channel, returned to Spithead. He then led the 33d to Poole, and there became so seriously ill that he could not embark when, in January 1796, the regiment started for the East Indies. However, by taking passage on board a swift man-of-war, he overtook it at the Cape, and landed with it at Calcutta in February 1797. Within two months he was nominated to command an expedition against Manilla; but the troops were recalled when they had but reached Penang. He occupied himself in compiling regimental orders for troops on board ship, and wrote papers on Pulo-Penang and on Bengal, which showed great talent as a financier. He also wrote on the necessity of expelling the French from Mauritius, and on many other subjects connected with the government of India. At the same time he energetically protected the interests of his men whenever threatened.

In the winter of 1797 he visited Lord Hobart at Madras, and his military memoranda of that date show how customary it was with him to study the topography of any country he might be in, a habit which led him, three years beforehand, to select the field of Waterloo as the spot on which a battle for the defence of Brussels against an invasion from the south ought to be fought.

On 17th May 1798 his brother, Lord Mornington, landed at Calcutta as governor-general. A letter written on this occasion was the first signed 'Arthur Wellesley,' a spelling which, following the usage of his family, he henceforward adopted. Lord Mornington found the British settlements, then a mere fringe on the edges of India, in considerable danger. Bonaparte was in Egypt, threatening to attack India, and Tippoo, sultan of Mysore, was coquetting with the governor of Mauritius, by whose aid he hoped to drive the British out of the country. After some months of vexatious delay, utilised, however, in prepara-

tions and much diplomatic fencing, an expedition against Tippoo was set on foot. Wellesley and the 33d were despatched from Calcutta to Madras. The transport ran on the Ságar reef in the Hooghly, but soon got off undamaged. It took six weeks to perform the voyage, and all on board suffered from dysentery, fifteen men dying owing to the bad water. On 29th January 1799 General Harris took command, and General Stuart, with 6000 men, prepared to co-operate with him from Bombay in an attack upon Seringapatam, but was himself assailed without success, on 6th March, by Tippoo. Three weeks later General Harris' army, after capturing many fortified posts, met the sultan near Malvalli, on the right bank of the Maddoor. Wellesley, in command of the left brigade, moved in echelon, the 33d leading, against Tippoo's right, and his vigorous onset, combined with the charge of General Floyd's cavalry brigade, routed the enemy in less than two hours. His loss was but a few score in killed and wounded, the enemy's nearly 2000. General Harris then outmanœuvred Tippoo and invested him in Seringapatam. A night attack in two columns, on 5th April, against the outposts was only partially successful. The column led by Wellesley failed to find the post and got into confusion. Next day, however, the same troops carried the post with ease and little loss. Wellesley, who had been slightly wounded in the knee, was much mortified at his first failure. At the final assault, when Tippoo was slain, he led the reserve column, and took command of the place after its capture. By vigour and justice he put a stop to the great disorder which ensued, and restored confidence amongst the people. During three months as governor of Seringapatam he found himself engaged in numberless ways, as soldier, engineer, statesman, traffic-manager, and even sanitary authority. He had to bury Tippoo with due pomp, see to the removal and pensioning of his sons and wives, restore the old Hindu dynasty, and control the distribution of over a million sterling of prize money. In administering the affairs of the place he showed great capacity, and his opinion was sought in settling the future of the conquered province.

On 24th August 1799 he was appointed to command the troops in Mysore in General Harris' place, and engaged in the onerous work of establishing tranquillity there. The principal cause of trouble was a Mahratta freebooter, Dhundia Wágh, who had collected some 5000 men and six guns, and executed numerous successful raids. After hunting him from 15th June to 10th September, Wellesley, at the head of four regiments of cavalry, and without waiting for his infantry, dashed upon him, killed him, and dispersed his following. In the camp his little son was found, of whom Wellesley took charge and was mindful in after years. When he quitted India he left some hundreds of pounds to be expended upon the boy, who died in 1822 of cholera. Prevented by illness from joining Baird's expedition from Kosseir to the Nile, Wellesley remained two years longer in Mysore, and on 29th April 1802 was promoted major-general.

The treaty of Bassein (December 31, 1802), which made an ally of the Peshwá, consolidated British power in India, but soon necessitated military operations against the rival Mahratta chiefs, Sindhia and Holkar, by whom he had been deposed. At the request of Lord Clive, General Wellesley was given the command of a mixed force some 10,000 strong, with which he covered 600 miles in forty-two days, and entered Poona, the Mahratta capital, on 20th April 1803. In the last march he rode with the cavalry alone 60 miles in thirty-two hours, and by his sudden appearance saved the city from being burned by Holkar's lieutenant Amrut Rao. Behind him he left posts, and arranged for the construction of basket-boats, so as to be able to continue his operations during the rainy season. For some time he occupied an isolated and dangerous position, threatened by the disaffected chiefs from the north and separated from a second division coming from the west under Colonel Stevenson. At length having received full political powers, he called upon Sindhia to withdraw north of the Nerbudda, and on his failing to do so declared war against him on 6th August 1803. General Wellesley moved at once, captured Ahmadnagar on the 11th, crossed the Godavari on the 21st, and on the 23d found himself confronted by the combined forces of Sindhia and the rajah of Berar at Assaye. Their numbers have been estimated at from 40,000 to 50,000, with a hundred guns. Judging that bold action was the safest, though the enemy's position was strong, he attacked at once, and after a much more serious battle than any which had hitherto been fought in India gained a complete victory, capturing all the Mahratta guns. His loss was 2500 out of a force little exceeding 7000 men. Stevenson's division having effected a junction with him pursued the enemy, and Wellesley finished the campaign by the victory of Argaum and the storming of Gáwilghar in December. The treaties with Sindhia and the rajah of Berar were signed by him, and the Mahratta power was completely broken.

His despatches concerning these matters and Indian policy generally show him to have been one of the ablest of administrators. Now Sir Arthur Wellesley, K.C.B., he returned home early in 1805, and accompanied the abortive expedition to Hanover. The following year he entered parliament again as member for Rye, and in 1807 was appointed Irish Secretary, but after a few months was sent to Copenhagen, where he commanded the troops which drove the Danes out of Zealand. He then returned to the Irish Office, but in July embarked with some 10,000 men for the relief of Portugal. His army landed at Mondego Bay in August 1808, and on the 17th he defeated the French under Junot at Roliça. On the 21st he inflicted a second defeat upon them at Vimiera, but was superseded during the battle by Sir Harry Burrard. He, contrary to Wellesley's advice, concluded the convention of Cintra, which ensured the evacuation of Portugal indeed, but saved the French from capitulation—the inevitable result if his plans had been adhered to.

Recalled to England to give evidence before the court of inquiry into the circumstances connected with the convention, by which he was fully exonerated, he took up his Irish duties again during the winter of 1808–9, while Sir John Moore's campaign was going on. But after its failure he was given the chief command in the Peninsula, and landed at Lisbon on 22d April 1809. Then began that marvellous display of generalship, foresight, and tenacity of purpose which, ending in the expulsion of the French from Spain and the capture of Toulouse on 12th April 1814, is known by the name of the Peninsular War (q.v.). The honours conferred upon him were numerous. He became Lieutenant-general on 26th April 1808 and G.C.B.; Baron Douro of Wellesley, county Somerset, and Viscount Wellington of Talavera and Wellington in the same county on 4th September 1809; Earl of Wellington on 28th February 1812, and Marquis on 3d October; Field-marshal on 3d July 1813; Marquis Douro and Duke of Wellington on 11th May 1814, and Knight of the Garter. He was also made Duke of Ciudad Rodrigo, Magnate of Portugal, and Grandee of the first class in Spain; Duke of Vittoria, Marquis of Torres Vedras, and Count Vimiera in Portugal; and received all the

most distinguished foreign orders, including the Golden Fleece. It is remarkable that he took the place amongst the knights of the Bath rendered vacant by the death of Lord Nelson. The duke reached Paris early in May, and after a short visit to Madrid, where he gave good but unheeded advice to King Ferdinand VII., returned to England after an unbroken period of five years' active service.

He was heartily welcomed home. From Westminster Bridge, on 23d June 1814, the crowd dragged his carriage to the duchess's house in Hamilton Place. On the 24th he joined the Regent and his royal guests at Portsmouth, and then took his seat in the House of Peers. A committee of fifteen from the House of Commons presented the thanks and congratulations of that assembly, and on 1st July from a place inside the bar he thanked them for the grant of £400,000 voted on 12th May. A week later he carried the sword of state at the solemn thanksgiving service in St Paul's, and was entertained soon after by the city at the Guildhall.

Very soon afterwards he was sent as ambassador to Paris, where he was naturally ill received. Realising this, Lord Liverpool offered him the American command, but he declined to quit Europe, and remained at his post until the early part of 1815, when he took Lord Castlereagh's place at the Vienna congress. On 7th March of that year he heard by courier from Florence that Napoleon had quitted Elba. The allies at once directed their forces against France. Wellington took command of the army in the Netherlands, arriving in Brussels on 4th April. It was a hard task to form this army, but by the end of May he had under him 150,000 men—British, Hanoverians, Brunswickers, Nassauers, and Dutch-Belgians. The last were favourably inclined towards the French, and only about one-third of the whole was available for field-service. Blücher with 116,000 Prussians was, however, ready to act and in communication with him. Failing to induce the allies to negotiate, Napoleon quitted Paris on 12th June and threw himself upon Blücher and Wellington. On the 16th he defeated the former at Ligny, whilst Ney pressed hard upon the latter at Quatre Bras. But designing to fight in conjunction on the chosen position of Mont St Jean, the allies retired so as to effect this object, with the result that the French army was totally routed on the 18th June in the famous battle of Waterloo (q.v.). Paris capitulated on 3d July, and Napoleon surrendered to the captain of H.M.S. *Bellerophon* at Rochefort.

Wellington was created Prince of Waterloo in the Netherlands, the estate of Strathfieldsaye, in Hampshire, purchased from Lord Rivers for £263,000, was presented to him by the nation, and his career of active service ended. Except Frederick the Great and Bonaparte in Italy, no general of modern times had done so much with such scanty and uncertain resources. But owing to the fact that the emperors of Austria and Russia were still at Nancy, Wellington in Paris held a most important position. In order to meet the hostility of the latter sovereign to Louis XVIII. by conciliating the French troops and populace, he found it expedient to appoint the powerful but infamous Fouché minister to the king, and in the subsequent treaty withstood the demand of Prussia for the cession of Alsace and Lorraine. He had already saved the Bridge of Jena from the destruction with which it was threatened by Prussian patriotism. Appointed commander-in-chief of the joint army of occupation, he exercised a very salutary influence in the royal counsels, besides reconstructing the military frontier of the Netherlands, and performing the other duties of the post. He had many enemies in Paris. An attempt to set fire to his house on the night of the 25th June 1816 nearly succeeded, but fortunately he was giving a ball, and his servants at once detected the smell of fire before it reached the barrels of oil and bottles of gunpowder which had been maliciously placed in the cellar. On the night of the 11th February 1818 a jolt of his carriage saved him from the bullet of the assassin Cantillon, which passed through both windows. In this year when the French had, by the help of Messrs Baring, paid all the indemnities, the congress of Aix-la-Chapelle, acting on his advice, terminated the occupation originally fixed for five years.

Returning to England he joined Lord Liverpool's cabinet as Master-general of the Ordnance. In 1826 he was made Constable of the Tower, and the following year Commander-in-chief. He represented Great Britain at the congress of Verona on the death of Lord Castlereagh, and was able to prevent any joint interference with the affairs of Spain. As a member of Lord Liverpool's administration, he agreed to the St Petersburg protocol of 4th April 1827, designed to urge upon Turkey the Greek claim to autonomy, but without threats of intervention. On Canning's becoming prime-minister and going beyond this he withdrew from the cabinet, resigning the offices of Master-general of Ordnance and Commander-in-chief. Canning then concluded the treaty of London on 27th July, binding France, England, and Russia to enforce the protocol. This, as Wellington had foreseen, brought about the battle of Navarino.

On the death of Canning in August 1827, and the fall of Lord Goderich's cabinet in January following, the duke became prime-minister—only, however, at the king's earnest desire. He disappointed the Tories by advising the Lords not to oppose the Test and Corporation Acts which had been passed in the Lower House, and by a quarrel with Huskisson lost his support and that of all the Liberal members of his cabinet. Becoming, with Peel, convinced that Catholic emancipation was necessary, he brought in a bill to grant it in 1829. As he had always hitherto opposed such a measure, he incurred thereby much odium; and the Earl of Winchilsea published a letter accusing him of a design to introduce Popery. The duke thereupon called him out, and a duel with pistols was fought in Battersea Fields—his first and only duel. The duke intentionally fired wide and the earl fired into the air, so that no harm ensued, and the calumnies ceased (see Vol. IV. p. 108). Desiring to work for the good of the country alone, and not as a party man, he could not work harmoniously with his colleagues. By withdrawing, after Navarino, from intervention in the East, he lost the power of moderating Russian influence there. In Portugal he was favourable to Dom Miguel and the absolutists, and generally showed little sympathy with national causes. Failing to recognise the earnestness of the demand for parliamentary reform in 1830, he declared against it, and thus brought about the fall of his government, becoming so unpopular that he was hooted by the mob on the anniversary of Waterloo, and the windows of Apsley House broken, so that he had them protected with iron shutters. On the occasion of a visit he paid to Lincoln's Inn the mob were so threatening that he had to be escorted home by the lawyers.

Again called upon by King William IV. in 1834 to form a cabinet, he recommended Peel as prime-minister, reserving for himself the post of Foreign Secretary. Sir Robert was in Italy, but the duke was sworn in as First Lord and Secretary of State for the Home Department, so as to enable him to act in all the other offices until Peel's return in three weeks' time. This brief dictatorship greatly raised his reputation as a statesman. In January 1834, too, he had been chosen Chancellor of the

university of Oxford. Sir Robert Peel resigned in April 1835, but returned to power in 1841. Wellington joined his cabinet, but with no office except that of Commander-in-chief, and supported his Corn-law legislation. On his defeat in 1846 the duke retired from public life. He had been made Lord High Constable of England and again Master-general of Ordnance in 1838, and in 1842 Commander-in-chief by patent for life. In 1848 he organised the military in London against the Chartists in such a way that, without showing a soldier or a gun, the city was fully protected.

As age crept over him he became irritable about trifles and rather deaf, but retained his patience in grave matters and his keen eyesight. His last important service was a letter upon the defenceless state of the south coast, addressed to Sir John Burgoyne, which had great results. On 1st May 1850, his birthday, a prince was born to whom he stood sponsor and gave his name. At the opening of the Exhibition of 1851 he walked in the procession, but on 14th September the following year faded peacefully away in his armchair at Walmer. After lying in state at Chelsea Hospital, he was buried with great pomp in St Paul's. All European nations, except Austria, were represented at the funeral, and it was felt by all that a great captain and a supremely dutiful, honest man had passed away. The monument to his memory, by Alfred Stevens (q.v.), is an imposing tribute to his worth. As regards his personal appearance and character: before age had bowed his figure, his height was 5 feet 9 inches, his build slight, but with square shoulders and a good chest. His eyes were violet-gray, clear, and penetrating; his nose, Roman; hair, brown; and his whole countenance, which has been compared to Cæsar's, expressive of great power and resolution. Though accused of want of feeling, there are many instances of the 'Iron Duke' being much affected by the loss of friends, and his charity, though unostentatious, was profuse. Mr Gleig asserts that he gave away £4000 in one year. He was a man of the strictest integrity and devotion to duty. In everything he looked upon himself as the servant of the sovereign, and never allowed personal considerations to sway his opinions or actions.

Besides the many honours already mentioned, he was colonel of the Grenadier Guards, colonel-in-chief of the Rifle Brigade, Lord Warden of the Cinque Ports, Commissioner of the Royal Military College and Military Asylum, lord-lieutenant of Hants, chief ranger and keeper of Hyde and St James's parks. His duchess had died on 25th April 1831, leaving three sons and three daughters. To one of the latter Her Majesty Queen Victoria stood sponsor in person. His eldest son was Arthur Richard, second Duke of Wellington, K.G., &c., born 3d February 1807. He died without issue 13th August 1884, and was succeeded by his nephew Henry (1846–1900), second son of Major-general Lord Charles Wellesley.

A good account of his life and campaigns by Rev. C. N. Wright appeared in 1841. Other biographies are by Rev. G. R. Gleig (a personal friend), General Brialmont, Yonge, G. L. Browne, Hooper, Earl Roberts (1895), and Sir H. Maxwell (2 vols. 1899). His despatches, edited by Colonel Gurwood, are in themselves a military autobiography, supplemented as they have been by others edited by his son, who also published his speeches.

Wellington College, in Berkshire, 4 miles SSE. of Wokingham, a public school founded in 1853, in memory of the Duke of Wellington, from funds raised by public subscription. The foundation-stone was laid by Queen Victoria in 1856, and it was opened by her in 1859. It has ninety scholarships for the sons of deceased army officers, twelve exhibitions, seven open scholarships, and over 400 boys, the foundationers being boarded and educated for £10 per annum and non-foundationers for £110.

Wellingtonia. See SEQUOIA.

Wells, streams, and lakes among primitive peoples are usually regarded as infested by local nature-spirits, kind or cruel, to which offerings may be made. The savage invests everything with personality and life, and what is poetry to us is philosophy to him. The Ganges is still a sacred stream even to the civilised Hindu, and we need not be surprised to find the Xanthos or Scamander among the Homeric Greeks provided with its priest and appeased with sacrifices. Melusine (q.v.); the water-kelpie, for which it came out before the Crofters Commission in 1888 that a loch in the Gairloch district had been trawled and quicklimed in vain not twenty-five years before; and the sea-serpent seen every now and then on our shores show the malignant side of this nature-superstition, just as its more beneficent aspects are seen in our healing-wells and wishing-wells, in the 'well-wakes' that lingered in corners of Shropshire into the 19th century, and the floral-offerings—'well-dressings' of Derbyshire (notably at Tissington), Staffordshire, Westmorland, and north Lancashire, to which Milton alludes in *Comus*. Christianity only substituted a saint's name for the indigenous nature-deity, and water-worship held its place—in Brittany, in Ireland, in St Chad's baptismal well at Lichfield, St Milburga's at Much Wenlock, and hundreds of other places. The worship of fountains is condemned in the canons of St Anselm (1102), but continued for centuries afterwards. In St Bede's well, near Jarrow, weakly children are dipped and crooked pins offered; at St Helen's well in Yorkshire pieces of cloth are offered; Fergan well near the Scotch Avon was good for skin diseases and running sores; St Dwynwen's well in Anglesea was good against love-sickness, St Cynhafal's in Denbighshire against warts; at Sefton in Lancashire there is a well into which maidens throw pins in order to divine the date of marriage and test the fidelity of their lovers. Ailing children were carried to St Anthony's well at Maybole on the first Sunday of May; the well at Trinity Gask in Perthshire was sought on the first Sunday of June. The well of St Keyne (q.v.) in Cornwall had peculiar properties of special interest to husbands and wives. The most famous of all in England is that at Holywell which sprang up of itself at the place within St Beuno's Church to which rolled the head of St Winifred when struck off by Caradog ab Alan. The flow of water has never since ceased, and in 1876 the well was leased to the corporation of Holywell by the Duke of Westminster for a thousand years at a sovereign a year. There is but one story against its virtue told by Lilly of Sir George Peckham, who died in the well in 1635, 'having continued so long mumbling his pater nosters and "Sancta Winifreda, ora pro me," that the cold struck into his body, and after his coming forth of that well he never spoke more.' At St Tecla's well in Denbighshire a man could transfer his epilepsy to a cock after bathing in the well. Richard Baxter when a schoolboy heard a well at Oundle in Northamptonshire emit a noise like a drum about the time the Scots came into England, and was told the same well drummed again when Charles II. died. St Elian's in Denbighshire is the chief of the 'cursing-wells' of Wales, and it is possible to make an enemy pine by casting into it a pin and a pebble inscribed with his name.

See books by Brand, Henderson, Burne, Gregor, Wirt Sikes, Black, Hope (1893), and Mackinlay (1894).

Wells, the city of Somerset, pleasantly situated at the foot of the Mendip Hills, 20 miles SW. of

Bath and 20 (30 by rail) S. of Bristol. Here, near St Andrew's Well, from which and other springs the place took its name, King Ina in 704 established a house of secular canons; but the see was first founded in 909 by Edward the Elder, and the city has grown up round the cathedral. The see was translated to Bath during the first half of the 12th century, and still is styled Bath and Wells, though Bath's connection has been purely titular since the Reformation. Among its seventy bishops have been Jocelin (1206–42), the 'second founder' of the cathedral, Fox, Wolsey, Barlow, Laud, and Ken. That cathedral, though one of the smallest yet perhaps the most beautiful of English cathedrals, is mainly Early English in style, and is 371 feet long, by 123 across the transept, while the height of the central tower is 160 feet, of the two western towers 130. Its principal glory is the west front, with its matchless sculptures (600 figures in all, of which 151 are life-size or colossal); but other features are the north porch, the inverted tower arches, the east Jesse window with its splendid old glass, the exquisite lady chapel, and the octagonal chapter-house with its windows and central column in the perfect style of 1300. Other buildings, all of extreme interest, are the moated episcopal palace, with an undercrypt of about 1220; the deanery, rebuilt by Dean Gunthorpe in the reign of Edward IV.; the archdeaconry, now remodelled as a theological college; the gateways; and St Cuthbert's Church, with a noble west tower. Chartered by King John in 1202, Wells lost one of its members in 1867, and the second in 1868. Pop. (1851) 4736; (1891) 4822.

See works by Britton (1821), Parker (1860), Freeman (1870), Reynolds (1881), Jewers (1892), and Church (1894).

Wells, Charles Jeremiah, an English poet, who has been till lately strangely neglected by his countrymen, was born in London in 1800. He was a school companion of R. H. Horne and Keats's brother at Enfield, and at the age of fifteen sent Keats a present of flowers, which the poet acknowledged in the sonnet beginning 'As late I rambled in the happy fields.' A few years afterwards he quarrelled with Keats, and his *Stories after Nature*, fantastic and sometimes graceful tales in poetic prose, showing strangely the influence of Leigh Hunt, were written, it is said, to show Keats that he 'could do something.' The book, which was published in 1822, fell still-born, and was followed in 1824 by the noble biblical drama, *Joseph and his Brethren*. The poem attracted no attention, and remained practically unknown until attention was directed to its consummate beauties by Mr Swinburne in an article in the *Fortnightly Review* of 1875; his attention had been called to it by Rossetti. On the failure of his verses to attract notice, Wells abandoned literature. He adopted law as his profession, went to Brittany in 1840, and finally settled at Marseilles, where he died on February 17, 1879. *Joseph and his Brethren* is one of the finest dramatic poems in the language. The verse is fiery with passion and rich even to overrichness in graceful and glowing imagery. In one character, the heroine, Phraxanor, the writer shows a truly wonderful strength and subtlety of dramatic insight. Only once before, says Mr Swinburne, has such a character been given with supreme success—viz. in Shakespeare's Cleopatra. It may be, he adds, that only the dullness of fashion has kept out of sight 'a poet who was meant to take his place among the highest.'

Besides Mr Swinburne's article, see two articles by Theodore Watts in *The Athenæum* (1876, 1879); *The Academy* for March and April 1879; Mr Buxton Forman in Miles's *English Poets of the Century;* and Linton's preface to a new edition of *Stories after Nature* (1891).

Wellsville, a town of Ohio, on the Ohio River, 48 miles by rail WNW. of Pittsburgh, manufactures steel, terra-cotta, &c. Pop. 5247.

Welsbach Light. See Gas-lighting (p. 103).

Welsh, or Welch, John (*c.* 1568–1622), Presbyterian divine, was minister of Ayr from 1590 till his imprisonment by James VI. in 1605 for defying the king in defence of the church's independence, and then preached to Huguenot congregations at various towns in France till 1622, when he passed over to London. From him and his wife, a daughter of Knox, Mrs Carlyle claimed descent. See Young's Life of him, edited by Anderson (1866).

Welsh Language. See Wales.

Welsh Onion, or Cibol (*Allium fistulosum*), a perennial plant, a native of Siberia, with fistular leaves and no bulb, and a flavour resembling garlic. It is cultivated in various parts of Europe, including England. 'Welsh' here only means, as it used to do, 'foreign' (like the German *Wälsch*).

Welshpool, a town of Montgomeryshire, North Wales, near the left bank of the Severn, 20 miles W. by S. of Shrewsbury. It has a parish church (restored by Street), a town-hall and market (1873) with a clock-tower 90 feet high, and the Powysland Museum (1874); whilst 1 mile south is Powis Castle, dating from the 12th century, with a fine picture-gallery and park—the seat from Elizabeth's time of the Herberts, as now of their and Clive's descendant, the Earl of Powis. The flannel manufacture has migrated to Newtown. Incorporated by James I. in 1615, Welshpool is one of the six Montgomeryshire (q.v.) boroughs. Pop. (1851) 6564; (1891) 6489.

Welwitschia (named after Friedrich Welwitsch, Austrian traveller, 1806–72), a genus of African Gymnosperms (q.v.) belonging to the Gnetaceæ (see Sea-grape), and containing only one species (*W. mirabilis*). The stem of this remarkable plant may when mature be little over a foot high but several feet across. It bears but two leaves, the cotyledons, which sometimes grow to be 5 or 6 feet long and 2 or 3 wide, ultimately splitting into strips. The plant is said to live over 100 years. The flower consists of a panicle of brilliant overlapping scarlet scales.

Wem, a market-town of Shropshire, on the Ellesmere Canal, 11 miles N. by E. of Shrewsbury. Pop. 2600.

Wemyss, Francis Wemyss Charteris Douglas, Earl of, a father of the volunteer movement, was born 4th August 1818 and educated at Eton and Christ Church, Oxford. He sat in parliament for a division of Gloucestershire in 1841–46, followed Sir Robert Peel on the repeal of the Corn Laws, and sat for Haddingtonshire as a Liberal Conservative from 1847 till in 1883 he succeeded his father as ninth earl. As Lord Elcho he was a Lord of the Treasury in the Aberdeen Ministry from 1852 till 1855. He took a very prominent part in the volunteer movement, frequently presided over the rifle meetings at Wimbledon, and wrote *Letters on Military Organisation* (1871).

Wen-chow (*Wan-chau*), a Chinese treaty port in the province of Chch-kiang, at the head of a bay or estuary. Pop. 80,000.

Wendover, a village and parish of Bucks, under the Chiltern Hills, 5 miles SE. of Aylesbury; pop. 2000. It sent members to parliament till 1832. For Roger of Wendover, a monk of St Albans, who died 1236, see Paris (Matthew).

Wends, the name given by the Germans to a branch of the Slavs (q.v.) which, as early as the 6th century, occupied the north and east of Germany from the Elbe along the coast of the Baltic

to the Vistula, and as far south as Bohemia. They were divided into several tribes, which were successively subdued by the Germans, and either extirpated or gradually Germanised and absorbed more or less perfectly. In a narrower sense the name of Wends is given to those remnants of the Slavic population of Lusatia (q.v.) who still speak the Wendish tongue, and preserve their peculiar manners and customs. Of these Lusatian Wends or Sorbs, Upper and Lower, there were in 1889 in Saxony 56,000, in Prussia 103,000. Outside Lusatia there were 3400 in Saxony, 1000 in Prussia, 3000 in foreign parts.

Of the language there are grammars by Seiler (1830), Jordan (1841), F. Schneider (1853), Pfuhl (1867), and Liebsch (1884); dictionaries by K. Bose (1840), Zwahr (1847). Schmaler's *Volkslieder der Wenden* (2 vols. 1843) is more trustworthy than Veckenstedt's *Wendische Sagen, Märchen*, &c. (1879). See also L. Giesebrecht, *Wendische Geschichten aus den Jahren 780–1182* (3 vols. 1841–43); R. Andree, *Das Sprachgebiet der Lausitzer Wenden* (1873); Schulenberg, *Wend. Volkstum* (1882); and Mucke, *Statistik der Lausitzer Wenden* (1886).

Wendt, Hans Hinrich, German theologian, was born in Hamburg, 18th June 1853, studied at Leipzig, Göttingen, and Tübingen, became *privat-docent* in theology at Göttingen (1877), and professor extra-ordinary (1881), and was called to a chair at Kiel in 1883, at Heidelberg in 1885. His books include *Die Begriffe Fleisch und Geist im biblischen Sprachgebrauch* (1878), *Die Christliche Lehre von der menschlichen Vollkommenheit* (1882), and *Die Lehre Jesu* (2 vols. 1886–90; Eng. trans. 1892—a book of unique importance), as well as the 5th to 7th editions of Meyer's Commentary on the Acts (1880–89).

Wener, Lake (*Vener*), the largest lake in the Scandinavian peninsula, and after the lakes Ladoga and Onega in Russia the largest in Europe, is situated in the south-west of Sweden, and separated by a comparatively narrow strip of land (nearly 20 miles wide) from the fiords of the Cattegat. It is nearly 100 miles in length, 50 miles in greatest breadth, and 300 feet in greatest depth, and lies 150 feet above sea-level; area, 2408 sq. m. From the north shore a peninsula extends southward into the middle of the lake; and from the southern shore a peninsula extends northward to within about 15 miles of the point of the northern peninsula; the portion of the lake lying to the west of these peninsulas receives the name of Dalbo Lake. Of the numerous rivers that feed the lake the chief is the Klar, from the north, and its surplus waters are discharged into the Cattegat by the river Göta. It is connected by a canal with Lake Wetter, by means of which and the Göta Canal, Lake Roxen, &c. inland communication is established between the Cattegat and the Baltic Sea. The lake is rich in fish; it is often visited by sudden gusts of wind, and is in many places too shallow for navigation. There are many islands.

Wenham Lake. See Ice.

Wenlock, a municipal borough of Shropshire, extending over more than 50 sq. m., and comprising Much Wenlock, Broseley (q.v.), Coalport, Madeley, Ironbridge, and Coalbrookdale (q.v.). It was incorporated by Edward IV. in 1448, and till 1885 returned two members to parliament. Much Wenlock, under the north-east end of Wenlock Edge, 12 miles SE. of Shrewsbury, has a quaint guild-hall (restored 1848), a market-hall (1879), a corn exchange (1852), a museum, and interesting remains of a Cluniac abbey, originally founded as a nunnery about 680 by Penda's granddaughter, St Milburga, and refounded in 1080 by Roger de Montgomery, Earl of Shrewsbury. Pop. of borough (1861) 19,699; (1891) 15,703—2180 in Much Wenlock registration district. For the Wenlock group in geology, see Silurian System.

Wens, or Sebaceous Cysts, are much more common on the scalp than in any other situation, though occasionally observed on the face, shoulders, &c., and consist of obstructed sebaceous glands, which enlarge by the internal pressure of their accumulated secretions. They are never of very large size; but several or many often occur in the same patient. The closed orifice may often be noticed in the form of a small dark depressed point, and in that case the duct may sometimes be gradually enlarged by the gentle introduction of a probe or director, and its contents pressed out. By this treatment wens may at all events be kept from being unsightly, and will sometimes shrivel up and disappear. If it fail, and the patient finds the tumour so annoying that he insists upon its removal, it must be exterminated with caustic or the knife. For the smaller cysts caustics may be employed. The most prominent part of the wen must be thoroughly cauterised with nitric acid or caustic potash, which will lead to the formation and separation of a slough; the tumour is thus laid open, and may either be left to empty itself and wither or may be emptied by pressure, and cauterised within. The larger cysts are readily removed by the knife; and under antiseptic precautions the operation is not dangerous.

Wensleydale Peerage. In 1856 Sir James Parke (1782–1868), a judge of the Court of Exchequer, was created a life-peer, in accordance with an ancient but, it was maintained, wholly obsolete usage. The resolution of the House of Lords, led by Lord Lyndhurst, not to receive the new baron, led to his being given a peerage of the usual kind (it died with him). There are, however, a number of official life-peers—the Lords of Appeal in Ordinary.

Wentletrap (*Scalaria*), a genus of Gasteropods related to the Turritellidæ. The elegant shell is spiral, with many whorls, the whorls deeply divided, and not always close together, crossed by remarkably elevated ribs, the aperture round and rather small. The colour is usually lustrous white. Scalaria is a predaceous Gasteropod, ranging from the shore to a depth of 100 fathoms. About 100 species of the genus are known. Those which have the whorls close together are called False Wentletraps by shell-collectors, those in which they are not contiguous are known as True Wentletraps. Of the former some are found in northern seas, as *Scalaria communis* on the coasts of Britain and of continental Europe, and *S. grœnlandica* on those of North America. The *true* wentletraps are all natives of the seas of warm climates. A species found in the south-east of Asia, and known as the Precious Wentletrap (*S. pretiosa*), was once in such esteem amongst shell-collectors that an extremely fine specimen is said to have been sold for 200 guineas; and an ordinary price was from three to five pounds. The shell may now be purchased for a few shillings.

Wentworth. See Strafford, Rockingham.

Werdau, a cloth-manufacturing town of Saxony, on the river Pleisse, 45 miles S. of Leipzig by rail. Pop. 14,665.

Werden, a town of Rhenish Prussia, on the Ruhr, 16 miles NE. of Düsseldorf by rail, with cloth manufactures. Pop. 7970.

Weregild, or Wergild, (A.S. *wer*, 'man,' and *geld*, 'satisfaction'), a composition by which, by the custom of Anglo-Saxons, Franks, and other Teutonic peoples, homicide and other heinous crimes against the person were expiated. There was an established progressive rate of weregild for homicide, varying at different times and among different Teutonic tribes, from the weregild of the

ecorl or peasant to that of the king. In Anglo-Saxon times the value of the king was 7200 shillings; an ealdorman, 2400; a king's *thegn*, 1200; an ordinary territorial *thegn*, 600; a *ecorl*, 200. In the time of Tacitus the weregild for homicide among the Germans was due to the relatives of the deceased; that for other crimes one-half to the injured party and one-half to the state. The sum paid to the relatives in case of homicide, also known as the *man-wyrth*, seems to have been looked on as the equivalent of the dead man's value. As the power of the community or king increased, the exaction of retribution for the death of its members was considered to be the duty of the state as well as of the relatives, and the principle of division was applied to homicide as well as minor crimes; each payment being a separate full equivalent for the value of the deceased, the one to appease the feud, the other to make atonement to the state. This double weregild is recognised in the compensation for the death of a king by the laws of the Mercians and Northumbrians. In the days of Edward the Elder the weregild had become a much more complicated penalty, the composition for homicide consisting of four different payments, two of which, the *fight-wite*, or penalty for a breach of the peace, and the *weregild*, went to the king as head of the state; while a sum called the *halsfang* was paid to the kindred to stay the hand of the avenger of blood, and the *manbote* was given to the overlord to compensate him for the loss of a vassal. The graduated scales of weregild in use among the different Teutonic nations throw much light on the gradations of society at the period. It does not appear that among the nations who recognised the principle of weregild the relatives were bound to accept a compensation for their kinsman's slaughter, in place of appeasing the death-feud by blood; the latter practice was often resorted to instead. It was only through the exertions of Archbishop Theodore that Egfred, the Christian king of the Angles of Northumbria, adopted the alternative of accepting a weregild for his brother slain in battle by the Mercians, in place of demanding the blood of the slayer. See VENDETTA.

Werewolf (A.S. *were-wulf—wer*, 'a man,' *wulf*, 'a wolf.' The modern Ger. *Währwolf* is the Middle High German *Werwolf*, Latinised as *garulphus* or *gerulphus*, whence the Old Fr. *garoul*, the modern name being pleonastically *loup-garou*). Halliwell quotes from a Bodleian MS. (*Dict. Archaic and Provincial Words*, s.v. 'a-charmed') a characteristic example of 'Folk-etymology:' 'Ther ben somme that eten chyldren and men, and eteth noon other flesh fro that tyme that thei be a-charmed with mannys flesh, for rather thei wolde be deed; *and thei be cleped werewolfes for men shulde be war of hem.*' The following passages from Gervase of Tilbury's *Otia Imperialia* and Richard Verstegan's *Restitution of Decayed Intelligence* (1605) give a summary of belief about the werewolf, one of the most uncanny of the creatures of human imagination. 'Vidimus enim frequenter in Anglia per lunationes homines in lupos mutari, quod hominum genus *gerulphos* Galli nominant, Angli vero *were-vulf* dicunt.' 'The were-wolves are certain sorcerers, who having anointed their bodies with an ointment which they make by the instinct of the devil, and putting on a certain enchanted girdle, do not only unto the view of others seem as wolves, but to their own thinking have both the shape and nature of wolves, so long as they wear the said girdle; and they do dispose themselves as very wolves, in worrying and killing, and most of human creatures.' This superstition was widely spread in ancient and mediæval times, and is still a living fact amongst many savage races, and even in corners of France, not to speak of Russia and Bulgaria. Wlislocki, writing in 1891 (*Journal Gypsy Soc.*), tells us of a gypsy fiddler's wife at Tórész in north Hungary, about ten years before, who kept the family in mutton and enabled her husband to start a thriving inn by her nocturnal ravages as a *rawanush*. The parson cured the woman by sprinkling her and the house with holy water; the peasants murdered the husband, and two of his slayers were then living in the village. Indeed we may say it is a commonplace of folklore that certain men by natural gift, or magic art, can turn for a time into ravening beasts, which Dr Tylor calls 'substantially a temporary metempsychosis or metamorphosis.' And Thomas Aquinas lends the weight of his grave authority to a sound theological explanation: 'All angels, good and bad, have by natural virtue the power of transmuting our bodies.' In various forms of mental disease there is a belief in a similar transformation, but this no doubt presupposes an antecedent sane belief in the possibility of such metamorphoses into animals. These insane delusions have been widely prevalent at various times in the history of human society, and have given rise to the name of *Lycanthropy*. The wolf is of course not the only animal, although the most common in western Europe. But in England he has long been unknown, and the cat has had to be largely employed in witch transformations. Herodotus tells us the Neuri turned to wolves for a few days every year. The Khonds of Orissa think some men have the art of 'mleepa,' and by the help of a god become mleepa tigers to kill their enemies, one of the man's four souls going out to animate the beast. The tribe of Budas again in Abyssinia, ironworkers and potters, have also the evil eye and the power of turning into hyænas, whence they are very properly denied the Christian sacrament. In Virgil's 8th Eclogue we read how Mœris makes himself a wolf by means of poisonous herbs, and how he witches away the crops and calls up dead folk from their graves. Petronius Arbiter has a story of the transformation of a *versipellis* or *turnskin*, and here also we find the note so familiar in European stories of werewolves and witches, of how when the wolf is wounded the man who wore his shape is found to bear exactly the same wound. We find werewolf warriors of peculiar ferocity in Scandinavian sagas, and to this day in Denmark a man who is a werewolf is recognised by his eyebrows meeting as if his soul were ready to take flight like a butterfly. The change of shape is often effected by taking off the clothes, putting on a girdle, or rubbing with magic salve. 'Wolf-girdles' are still spoken of at least in Germany, and in December, as Tylor notes, one must not 'talk of the wolf' by name lest the werewolves rend you. During the 16th century France was much infested with werewolves, the trial of Gilles Garnier at Dôle in 1573 being the most famous historical instance; and Olaus Magnus in the same period tells of specially accursed werewolves who were ferocious against the orthodox. But on the other hand we meet a more kindly view in the Bisclaveret of Marie de France's *lai*, and in the romance of *William and the Werewolf*—more in keeping with the usual folklore notion of interchangeable transformation and mutual relationship between the human and the animal world.

It is obvious that in all this there is a close connection with the obscure facts underlying Totemism. And, as we have seen, Dr Tylor connects it also with metempsychosis, and both at least agree in a common basis of animism. The mythological explanation (λύκος, 'wolf,' for λευκός, 'shining') is of course inadmissible, for the transformations were not confined to beasts with

shining coats. Equally inadmissible is the rationalistic explanation of an innate thirst for blood in some natures breaking out occasionally, together with hallucinations, into cannibalism, the chief victims being peasants whose chief terror was wolves. For the idea of such transformations must already have been familiar and common, rather than exceptional, and thus a belief in these necessarily presupposes a belief in lycanthropy.

The Rev. S. Baring-Gould's *Book of Were-wolves* (1865) contains good examples, but its theories may be neglected. The best account is Dr Wilhelm Hertz's monograph, *Der Werwolf* (1862). See also Richard Andree in *Ethnographische Parallelen und Vergleiche* (1878), and Dr E. B. Tylor's *Primitive Culture;* also the articles TOTEMISM, VAMPIRE, and WITCHCRAFT.

Wergeland, HENRIK. See NORWAY, p. 533.

Werner, ABRAHAM GOTTLOB, mineralogist and geologist (1750–1817). See GEOLOGY, p. 148.

Werner, E., pseudonym of Elisabeth Bürstenbinder, a novelist who, born in Berlin in 1838, attained eminence as a writer of novels and stories, of which *Sacred Vows, Fickle Fortune, Riven Bonds,* &c. have been translated into English.

Werner, FRIEDRICH LUDWIG ZACHARIAS, dramatist, was born at Königsberg, 18th November 1768, studied at the university there, and in 1793–1805 was in the Prussian civil service. As author of a series of dramas he became founder of a side branch of the Romantic school, that of the mysterious and extravagant 'fate-tragedies.' He was thrice married and thrice separated by divorce, entered the Catholic Church at Rome in 1811, and died a priest at Vienna, 17th January 1823. His chief works are *Die Söhne der Thals* (1803), *Das Kreuz an der Ostsee* (1804), and *Martin Luther* (1806). See the long essay in Carlyle's *Miscellanies.* There are biographies by Hitzig (1823), Schütz (1841), and Düntzer (1873).

Wernigerode, a town of Prussia, at the northern foot of the Harz Mountains, 50 miles SW. of Magdeburg, with an old castle and a pop. of 9085.

Werther. See GOETHE.

Wesel, a strongly fortified town of Prussia, at the confluence of the Lippe with the Rhine, 35 miles NW. of Düsseldorf by rail. Cloth, pottery, machinery, &c. are manufactured. Pop. (1890) 20,736.

Weser, a river of Germany, formed at Münden out of the Werra and the Fulda; hence it flows north through Prussia, till, passing Bremen, it forms for about 40 miles the boundary between Oldenburg and Prussia, and enters the North Sea by a wide but shallow estuary, after a course of 280 miles. It communicates with the Elbe by a canal.

Wesley, JOHN, was born on June 17 (o.s.), 1703, in Epworth Rectory, his father being the rector of that little Lincolnshire market-town. He was descended from a long line of English gentry and clergy; the Duke of Wellington (q.v.) belonged to a collateral branch of the same family. On the maternal side he was related to the more cultured and refined representatives of English Nonconformity, his mother's father being Dr Samuel Annesley, 'the St Paul of the Nonconformists.' In 1714 John Wesley was nominated on the foundation of Charterhouse School by the Duke of Buckingham. In 1720 he was elected to Christ Church, Oxford, of which House his brothers Samuel and Charles were also members. Wesley soon began to display an extraordinary conscientiousness and an ascetic tendency; Thomas à Kempis and Jeremy Taylor had much influence over him. He finally resolved to enter the church, and was ordained deacon in Christ Church Cathedral in 1725, and admitted to priest's orders in the same place in 1728. In 1726 he was unanimously elected fellow of Lincoln College, and in the same year he was chosen Greek lecturer and moderator of the classes. In 1727 he left Oxford to assist his father, but returned in 1729, becoming a zealous tutor. During his absence his brother Charles and two or three other young men began to attract special attention by what was at that time regarded as a quite fanatical religious earnestness. A young gentleman of Christ Church, struck by the exact regularity of their lives and studies, exclaimed, 'Here is a new sect of Methodists sprung up.' Many years after, Wesley defined Methodist as a man who arranges his life according to 'the method laid down in the New Testament.' The two Wesleys, James Hervey, and George Whitefield were the most distinguished of the Oxford Methodists. In 1732 Wesley formed the personal acquaintance of William Law, and was for a time much influenced by mystical theology. In 1735 Wesley's father died, and in the same year Wesley undertook a mission to Georgia under the direction of the Society for the Propagation of the Gospel. At that time Wesley was a High Churchman of the most rigid type. He had two daily services. He divided morning prayer, taking the Litany as a separate office. He inculcated severe fasting and confession before communion. He made a point of celebrating the holy communion weekly. He even refused the holy communion to all who were not episcopally baptised. He insisted upon baptism by immersion. He rebaptised the children of Dissenters. He refused to bury all who had not received Episcopalian baptism. At this moment in his career he seemed to be on the point of anticipating the work of Cardinal Newman by a century. But events were about to happen which would take him ultimately to the opposite pole of the ecclesiastical world. On his voyage to Georgia he had been greatly impressed by the perfect fearlessness of the Moravians when in momentary danger of shipwreck. His irritating ecclesiastical intolerance, and an unfortunate love-affair, produced strife and misunderstanding, and he returned to England in 1738. In London he met the Moravian missionary, Peter Böhler, and after much prayerful intercourse with him, was convinced that Christian faith was not an intellectual acceptance of orthodox opinions, but a vital act, and afterwards a habit of soul by which man, under the supernatural impulse of the Spirit of God, trusts in Christ, enters into living union with Christ, and then abides in Christ, so that he no longer lives, but Christ lives in him, as the vine lives in the branch, and as the controlling mind lives in the body. Then came the ever memorable 24th of May 1738, when Methodism as history knows it was born. The decisive moment is described in his *Journal:*

'In the evening I went very unwillingly to a society in Aldersgate Street, where one was reading Luther's preface to the Epistle to the Romans. About a quarter before nine, while he was describing the change which God works in the heart through faith in Christ, I felt my heart strangely warmed. I felt I did trust in Christ, Christ alone, for salvation, and an assurance was given me that He had taken away *my* sins, even *mine,* and saved *me* from the law of sin and death. I began to pray with all my might for those who had in a more especial manner despitefully used me and persecuted me. I then testified openly to all there what I now first felt.'

The Rubicon was crossed. The sweeping aside of ecclesiastical traditions, the rejection of Apostolical Succession, the ordination with his own hands of presbyters and bishops, the final organisation of a separate and fully-equipped church, were all logically involved in what took place that night. It is difficult for us to realise now the heathen condition of England at that time; no language can describe the degradation of the masses of the people. The clergy unwittingly rendered a great

service by closing their pulpits against Wesley; their intolerance, the example of Whitefield, and the needs of men drove him into the open air. He made the great innovation first at Bristol, where he preached to 3000 persons. England has never seen anything like his open-air work. During his itinerary of half a century 10,000, 20,000, and even 30,000 people would come together and wait patiently for hours until the great evangelist appeared on horseback upon the scene. He bestowed little labour either upon fashionable localities or upon sparsely populated agricultural districts. He gave his time and strength to neighbourhoods where the working-class abounded; hence the mass of his converts were colliers, miners, foundrymen, weavers, spinners, fishermen, artisans, yeomen, and day-labourers in towns. He never journeyed less than 4500 miles in one year; he always rose at four and preached at five, as well as two or even three times later. Until his seventieth year all his journeys were done on horseback, and he rode sixty or seventy miles day after day, as well as preached several times. Terrible persecutions broke out, and his life was frequently in danger; but he completely outlived all persecution, and the itineraries of his old age were triumphal processions from one end of the country to the other. During the fifty years of his unparalleled apostolate he travelled 250,000 miles and preached 40,000 sermons. Yet he managed to do a prodigious amount of literary work.

He wrote short grammars in the English, French, Latin, Greek, and Hebrew languages; a Compendium of Logic; extracts, for use in Kingswood School and elsewhere, from Phædrus, Ovid, Virgil, Horace, Juvenal, Persius, Martial, and Sallust; a complete English Dictionary; commentaries on the whole of the Old and New Testaments; a short Roman History; a History of England from the earliest times to the death of George II.; a concise Ecclesiastical History, from the birth of Christ to the beginning of the last century, in 4 vols.; a Compendium of Social Philosophy, in 5 vols.; a Christian Library, consisting of extracts from all the great theological writers of the universal church. This library of 50 vols. was prepared especially for the benefit of his itinerant preachers, and consisted of representatives of all the leading writers, ancient, mediæval, Puritan, and modern. In addition to this he prepared many editions of the *Imitation of Christ*, and of the principal works of such writers as Bunyan, Baxter, Principal Edwards, Rutherford, Law, Madame Guyon, and others; endless abridged biographies; and, singularly enough, an abridged edition of a famous novel of the time, Brooke's *Fool of Quality, or The History of Henry, Earl of Mordland*. He also wrote a curious book, which he entitled *Primitive Physic, or an Easy and Natural Method of Curing most Diseases*. He further prepared numerous collections of psalms, hymns, and sacred songs, with several works on music and collections of tunes. In addition, he published his own *Sermons* and *Journals*, and started in 1778 a monthly magazine which still exists. His works were so popular that, to use his own language, he 'unawares became rich.' He made not less than £30,000, every penny of which he distributed in charity during his life.

In addition to his literary and evangelistic work Wesley was a great philanthropist. He founded an orphans' home at Newcastle, charity schools in London, and a dispensary in Bristol. One of the most curious delusions that has ever persisted in Christendom is the notion that he continued to be theologically or ecclesiastically a High Churchman. There is much more ground in his later career for the contention of Dean Stanley that he was the founder of the Broad Church. Under his direction the Conference in 1770 adopted resolutions which produced an outburst of furious indignation on the part of his orthodox Calvinistic friends. These resolutions stated explicitly that the heathen who had never heard of Christ could be saved if they feared God and worked righteousness according to the light they had. On another occasion he wrote in his *Journal* that he had been reading the meditations of Marcus Aurelius, and that he was no doubt one of the 'many' who would 'come from the east and the west and sit down with Abraham, Isaac, and Jacob' in the kingdom of God, while nominal Christians were 'shut out.' He spoke in the strongest terms of the 'execrable wretches' who wrangled at the various church councils, and actually added: 'Surely Mohammedanism was let loose to reform the Christians! I know not but Constantinople has gained by the change.' On the other hand, he spoke of Ignatius Loyola as one of the greatest of men. As early as 1745 he expressed the conviction that bishops and presbyters are essentially one order, and that originally every Christian congregation was a church independent of all others. From this conviction he never departed. When in 1784 he ordained presbyters and a bishop for America, his brother Charles, who did retain High Church convictions, wrote the most earnest expostulations. To these John Wesley replied in the following sentences: 'I firmly believe I am a scriptural ἐπίσκοπος as much as any man in England or in Europe; for the uninterrupted succession I know to be a fable, which no man ever did or can prove.' In harmony with these convictions he himself ordained ministers for Scotland, for the colonies, and ultimately for England. No doubt he greatly loved the church in which he was born, and deeply deplored the providential circumstances which compelled him to vary more and more from her doctrines and practices. He took upon himself with the utmost reluctance the responsibility of organising a separate church. But the most striking feature of his life as a theologian was his readiness in the last resort, whatever it cost him, to adapt his creed to indisputable facts. He was the first great religious leader in modern times who heartily accepted the Baconian principle of verification in the region of theology. He was essentially a scientific theologian. The keynote of his career is found in the characteristic exclamation, 'Church or no church, the people must be saved.'

Wesley died on March 2, 1791, in the eighty-eighth year of his age. Almost his last words were 'the best of all is, God is with us.' The organisation, doctrine, and present condition of the societies founded by him will be found at METHODISTS.

See the Life by Tyerman (1870; new ed. 1876), and those by Southey (1820; new ed. 1889), Miss Wedgwood (1870), Urlin (1870), Rigg (1875), Telford (1886), Overton (1891), Kirton, Bevan, and others. There are Lives of Charles Wesley by Jackson (1841–49) and Telford (1886); of Samuel Wesley, the elder brother, by Tyerman (3 vols. 1866); of their mother, by Kirk (1866) and Clark (1886); and of the Wesley family, by Stevenson (1876).

WESLEY, CHARLES, his brother, was born at Epworth, December 18, 1707, had his education at Westminster and Christ Church, Oxford, became one of the Oxford Methodists, 'found rest to his soul' on Whitsunday 1737, and was throughout life indefatigable lieutenant to his greater brother, especially in Bristol and London. He died in London, March 29, 1788. He is said to have written 6500 hymns. The number of books of poetry published by the brothers, in conjunction or separately, 1738–86, was sixty-three. It is usual to ascribe all the translations from the German to John, the original hymns to Charles, except such as are traceable to John through his *Journals* and other works. The *Poetical Works* of the pair, officially edited for the Wesleyan Methodist Conference, fills thirteen volumes (1868–72). Many of Charles Wesley's hymns are exquisite poetry as well as devotion. It is enough to name 'Jesu, Lover of my Soul,' and 'O for a thousand tongues to sing.'

Wessel, JOHANN (also known as *Gansfort*), a reformer before the Reformation (1420–89), was born at Groningen, educated amongst the Brethren of the Common Life, and taught philosophy at Cologne, Louvain, Heidelberg, and Paris. A humanist by training, he based his theology on the Bible directly, and was revered by his disciples as *Lux Mundi*. See monographs by Ullmann (embodied in *Reformatoren vor der Reformation*, 1866), Friedrich (1862), Dödes (in *Studien u. Kritiken*, 1870).

Wessex. In 514 a swarm of Saxons, called *Gewissas*, landed on the shores of Southampton Water, and were soon reinforced by a band of Jutes, with whom they coalesced under their king, Cerdic (519–34), becoming known as the West Saxons. They quickly overran the modern Hampshire, and Wight, and the next king, Cynric (534–60), seized Salisbury Plain, and forced his way to the Thames, only to find his progress eastward barred by the Middle Saxons. Ceawlin (560–92) pushed back the Jutes of Kent, then turned northwards, seizing the valleys of the Thame and Cherwell, next the Severn, and in 583 destroyed the old Roman station of Uriconium. But farther progress northwards was checked by the defeat at Faddiley and by long internal dissensions. Next Mercia took their possessions north of the Thames and the Somersetshire Avon. In 635 Wessex accepted Christianity, next under Cenwealh (643–72) it extended its western border from the Axe to the Parret, under Ine (688–726) beyond the Parret, and under Cuthred (741–54) it threw off the Mercian yoke. Offa in 779 again pushed them to the Thames, but they now turned westwards and made themselves masters of Devon. From this time their influence constantly grew until in Egbert, under whom they reached to the Tamar, they rose to the lordship of the other kingdoms and states, and began the history of England. See EGBERT, and ENGLAND.

West, BENJAMIN, painter, was born at Springfield, Pennsylvania, 10th October 1738, of Quaker parentage, and, though lacking all encouragement, surprised his friends by his skill in drawing at the age of seven years, and at nine painted a picture in water-colours, which in after life he declared he had in some respects never surpassed. His first colours were made from leaves, berries, &c., and his brushes hairs stolen from a cat's tail. Thus self-taught, at the age of sixteen he practised portrait-painting in the villages near Philadelphia, and painted for a gunsmith his first historical picture, 'The Death of Socrates.' At eighteen he was painting portraits in Philadelphia, and later at New York, where in 1760 he was aided by some generous merchants to go and pursue his studies in Italy. At Rome he was patronised by Lord Grantham, whose portrait he painted, became the friend of Raphael Mengs, and as the first American artist ever seen in Italy attracted much attention. He painted his 'Cimon and Iphigenia' and 'Angelica and Medora,' and was elected member of the Academies of Florence, Bologna, and Parma. In 1763, visiting England on his way to America, he was induced to remain in London, and in 1765 married Eliza Shewell, to whom he had been engaged before leaving America. His 'Agrippina landing with the ashes of Germanicus' attracted the attention of George III., who was his steady friend and patron for forty years, during which time he sketched or painted 400 pictures. His 'Death of General Wolfe,' painted in the costume of the period, against the advice of all the most distinguished painters, effected a revolution in the historic art of Britain. For the king he painted a series of 28 religious pictures for Windsor Castle. Among his best-known works are 'Edward III. at Cressy,' 'The Black Prince at Poictiers,' 'Queen Philippa at Calais,' 'Penn's Treaty with the Indians,' 'Christ healing the Sick,' 'Death on the Pale Horse,' and the 'Battle of La Hogue.' In 1792 he succeeded Sir Joshua Reynolds as the President of the Royal Academy, but declined the honour of knighthood. He attained very great contemporary fame, his drawing being correct and his composition skilful, though the colouring is a monotonous and dull reddish brown. Through his whole career he was the generous friend, adviser, and patron of young artists. He died in London, March 11, 1820, and was buried with great pomp at St Paul's Cathedral. His wife died 1817. Two sons survived him.

There is a Life of him (not good) by John Galt (1820), and another in Allan Cunningham's *Lives;* the best authorities are Dunlap's *History of Arts in the United States* (New York, 1834), C. E. Lester's *Artists of America* (1846), and H. T. Tuckerman's *Book of the Artists* (1867).

West Australia. See WESTERN AUSTRALIA.

West Bay City, a town of Michigan, on the Saginaw River, opposite Bay City, with a very large trade in lumber, &c. Pop. (1880) 6397; (1890) 12,981.

Westborough, a small manufacturing town of Massachusetts, 32 miles by rail W. by S. of Boston, with a state reform school. Pop. 5229.

West Bromwich, a parliamentary, municipal, and county borough of Staffordshire, one of the most important towns in the great manufacturing and mining district known as the 'Black Country.' It is 5½ miles NW. of Birmingham, 90 SSE. of Liverpool, 93 NNE. of Bristol, and 113 NW. of London. The *Bromwic* of Domesday, and the seat in the 12th century of a Benedictine priory, it yet is of modern growth, having risen within the last hundred years from a mere village on a barren heath, in consequence mainly of the rich coal and iron mines in the vicinity, of the industries to which these give rise, and of the transport facilities by rail and canal. The public buildings, erected in 1875 at a cost of £30,000, comprise a town-hall with a fine organ, a tower 130 feet high, a market-hall, free library, public baths, &c. There are also the institute (1886), All Saints Church (rebuilt 1872), Christ Church (1829), with a tower 114 feet high and twelve bells, the West Bromwich district hospital (1867–82), and a public park of 65½ acres, with a boating and bathing pool, and commanding a beautiful view. The last was presented to the town in 1878–87 by the Earl of Dartmouth, whose ancestor purchased the manor in 1823, it having previously been held by Stanleys, Clarke-Jervoises, &c. The manufactures comprise all departments of Birmingham hardware, as gun-barrels, axle-boxes, locks, swords, bayonets, fire-irons, fenders, saucepans, safes, cooking-ranges, gas-stoves, &c. Puddling and sheet-iron rolling, sheet-glass making, coal-mining, and brick and tile making are also carried on to a great extent. By the Reform Act of 1867 West Bromwich was included within the parliamentary borough of Wednesbury, but since 1885 it has returned a member by itself. It was made a municipal borough in 1882 and a county borough in 1888. Pop. (1801) 5687; (1841) 26,121; (1881) 56,295; (1891) 59,489. See Joseph Reeves's *History of West Bromwich* (1836).

Westbury, a little market-town of Wiltshire, 16½ miles SSE. of Bath and 25 NW. of Salisbury. Returning till 1832 two members to parliament, and then till 1885 one, it has lost its clothing industry, but has iron-smelting works. The fine church has memories of Walter Map and Mackonochie. Westbury White Horse, cut out on the southern slope of Westbury Down (775 feet), is 175

feet long, and was restored in 1778 and 1853. It probably commemorates Alfred the Great's victory of Ethandún (Edington) over the Danes in 878 (see WHITE HORSE). Pop of parish, 5613.

Westbury, RICHARD BETHELL, BARON, was born at Bradford-on-Avon, the son of a Bristol physician, June 30, 1800. He had his schooling at Corsham, near Bath, and at Bristol, at fourteen entered Wadham College, Oxford, and was just eighteen when he graduated with a first-class in classics and a second in mathematics. Soon after he was elected to a fellowship in his college, and in 1823 he was called to the bar at the Middle Temple. His industry, acuteness, and audacity quickly brought him a large practice, and made him by 1841 the leader of the Chancery bar with an annual income of over £20,000. He became Q.C. in 1840, was returned as an advanced Liberal for Aylesbury in 1851, for Wolverhampton at the general election of 1852. Already in 1851 Vice-chancellor of the duchy of Lancaster, he became Solicitor-general in 1852, Attorney-general in 1856, and in 1861 succeeded Lord Campbell on the woolsack, taking his title from Westbury in Wiltshire. In the House of Commons he had borne the burden of several important measures of law reform—the Succession Duty Bill, the Probate and Administration Bill (1857), the Divorce and Matrimonial Bill, the Fraudulent Trustees Bill, and the Bankruptcy and Insolvency Bill (1861). His ideas about legal education were too comprehensive for his contemporaries, but induced the various Inns of Court to consolidate their rules. Unsuccessful also were his schemes for revising and codifying the statutes, and for putting an end to the separation between law and equity—a consummation effected by Lord Selborne which Westbury died a fortnight too soon to see. He delivered the judgment of the judicial committee of the Privy-council on the appeals in the 'Essays and Reviews' cases, and in the debate in the House of Lords employed the unwonted artillery of raillery and irony against Wilberforce and the whole bench of bishops. In 1865 Westbury was compelled to resign office through the clamour against some official appointments, but the chancellor was personally acquitted of unworthy motives. He opposed Gladstone's Irish Church Bill, and still more the Irish Land Act of 1870, and gave the last year of his life to arduous labour as arbitrator of the European Assurance Society. He died in London, July 20, 1873. Lord Westbury's acuteness of intellect was indeed great, but did not justify his merciless use of the weapon of sarcasm, and that of the bitterest. But he has had his reward. Though a zealous reformer and great lawyer, with a rare faculty of piercing quickly to the heart of his subject, he is already remembered only by a few stories and sayings, and these not all authentic. See his Life by T. A. Nash (2 vols. 1888).

West Calder, a mining-town of Midlothian, 16 miles WSW. of Edinburgh. Pop. 2516.

West Chester, capital of Chester county, Pennsylvania, 27 miles by rail W. of Philadelphia, with a normal school and the law department of Lincoln University, and foundries, machine-shops, and manufactories of flour, hosiery, soap, and tinware. Pop. 8028.

Westcott, BROOKE FOSS, a great New Testament scholar, was born near Birmingham in 1825, and, like Lightfoot, Hatch, and Benson, had his schooling under Prince Lee at King Edward's School, Birmingham, whence he passed to Trinity College, Cambridge. He carried off the Battie university scholarship, the medal for the Greek ode twice, the Bachelor's prize for the Latin essay twice, the Norrisian prize (1850), and in 1848 was bracketed first classic. Elected fellow of his college in 1849, he took orders in 1851, and was an assistant-master at Harrow from 1852 till 1869, when he became a canon of Peterborough. He was appointed regius professor of Divinity at Cambridge in 1870, chaplain-in-ordinary to the Queen in 1879, canon of Westminster in 1883, and in 1890 succeeded his dear friend Lightfoot in the bishopric of Durham. The D.D. of his own university (1870) was followed by the Oxford D.C.L. in 1881, and the Edinburgh D.D. at her tercentenary in 1883. He was one of the company for the revision of the Authorised Version of the New Testament, and his views are known to have had the greatest influence in the deliberations. His edition of *The New Testament in Greek* was published in 1881, the result, conjointly with Dr Hort, of the labours of twenty-eight years. The first volume contained the text, the second the introduction. Manuals of the greatest value, no less for their learning than their clearness of style, are *General Survey of the History of the New Testament Canon* (1855) and *An Introduction to the Study of the Gospels* (1860). No less admirable summaries of knowledge are *The Bible in the Church* (1864) and *A General View of the History of the English Bible* (1868). His commentaries are upon the Gospel of St John (*Speaker's Commentary*, 1882), the Epistles of St John (1883), and the Epistle to the Hebrews (1889).

Besides these Dr Westcott has published several volumes of strong and eloquent sermons: *Characteristics of the Gospel Miracles* (1859), *The Gospel of the Resurrection* (1866), *The Christian Life Manifold and One* (1869), *Steps in the Christian Life* (1880), *The Revelation of the Risen Lord* (1881), *The Historic Faith*, on Apostles' Creed (1883), *The Revelation of the Father* (1884), *Christus Consummator* (1887), *Social Aspects of Christianity* (1887), *The Victory of the Cross* (1888). Other books are *On Some Points in the Religious Office of the Universities* (1873), *The Paragraph Psalter* (1879), *Some Thoughts from the Ordinal* (1884), and *Essays in the History of Religious Thought in the West* (1891).

Westerly, a village of Rhode Island, on the Pawcatuck River, 44 miles by rail SSW. of Providence, with flannel and cotton mills. The township contains noted granite-quarries. Pop. 6813.

Western Australia embraces the western third of Australia. The Indian Ocean is to the north and west, the Southern Ocean to the south, South Australia, with its Northern Territory, to the east. It extends from 13° to 35° S. lat. and 113° to 129° E. long., being 1500 miles long by 1000 broad. The area is 1,060,000 sq. m., or 678,400,000 acres—i.e. nearly twenty times the size of England. While the central portions are stony or sandy, with the north and south coasts poor in soil, there is good land at the west and in the north-east. Less hilly than eastern Australia, it is not so well watered. The Darling Range, 300 miles in length, has few peaks of 3000 feet; Koikyeunerup, north of King George's Sound, is 3500 feet; and the King Leopold Mountains are north-east. Few rivers run in the dry season; the Swan, Blackwood, Murchison, Irwin, Gascoyne, and Greenough are in the south-west, Fortescue, Ashburton, and De Grey north-west, Fitzroy and Glenelg north-east. Several shallow salt lakes are inland. The chief islands are Rottnest, near the Swan River; Dirk Hartog, off Shark's Bay; the Abrolhos Guano Isles, west; Dampier Archipelago, north-west; Buccaneer Archipelago, north-east; Nuyt's Archipelago, south-east. Besides the south-western counties, there are the western Gascoyne division, the north-west division, the eastern division, the north-eastern Kimberley division, and the southern Encla division. Perth, the capital, has Fremantle for its port. Albany, on King George's Sound, is south-east of Perth: Bunbury, south-west; Geraldton,

Guildford, and Northampton are north; York, Northam, and Beverley, east. Carnarvon is the Shark's Bay port of the Gascoyne. Roebourne and Cossack are east of North-west Cape. Broome, Derby, and Wyndham are in the north-east division. Eucla port is in the extreme south-east.

The climate is, from its dryness, brightness, and freedom from miasma, much admired, though the north and north-west are less comfortable than the south-west, from excessive heat. The tropical interior has considerable cold on winter nights. Perth, during a year, varied from 38° to 106° in the shade; Cossack, 50° to 115°; Albany, 40° to 80°. The wet season south of Shark's Bay is in winter; north of it, in summer, or December to April. Cyclones often mark the changes. The average annual rainfall in Perth is 33 inches. In the wet year 1890, however, it was 47; Bunbury, 53; Cossack, 8. The trade-winds bring little rain to the northern coast.

In the geology two features are prominent, granite and recent limestone. The first prevails about King George's Sound, the north-west and north-east ranges, and in many parts of the desert interior. Palæozoic rocks crop out in the mountains; they are chiefly Silurian, and are much metamorphosed in the mining districts. The tablelands of Kimberley and about the Ashburton are of Devonian age. Carboniferous country is recognised by Stigmaria and Lepidodendron, though there are coal-measures of Mesozoic type, and non-caking coal of good quality is being dug between Bunbury and Albany. Workable beds exist on the Collie, Murchison, Gascoyne, and Irwin rivers. Tablelands, so common inland, are of sandstone, one kind older than the other. The flat-topped hills of the north are not conformable with the Carboniferous sandstones beneath. The desert sandstone, disintegrating, is the source of the red, shifting sand-dunes. Coralline limestone Tertiary formations abound around the coast. The limestone beneath the desert sandstone is rich in springs. Mesozoic fossils are Oolitic, Jurassic, and Lias; the Tertiary comprise the huge quadrupeds Dinotherium and Nototherium. Volcanic rocks are not uncommon, and Plutonic ones permeate the more ancient sedimentary strata.

Spaniards and Portuguese had the western and northern coasts in their maps about 1530. The Dutch re-discovered these parts. Dirk Hartog, in the ship *Eendracht*, was at Shark's Bay in 1616; Edel, north, 1619; De Witt, 1628; the ship *Leeuwin* or Lioness, 1622; the *Gulde Zeepard*, at the Swan and Nuytsland, 1627. Vlaming of the *Geelvinck* brought the black swan to Europe. Tasman sailed along the north in 1644. Dampier was there in 1688 and 1696; Vancouver, at the Sound, 1791; D'Entrecasteaux, 1792; Baudin, of the *Géographe* and *Naturaliste*, 1801; Flinders, 1801; King, 1820–22; the *Beagle* survey later. Captain Grey explored in 1838; Eyre, 1841; followed by Roe, Austin, A. and F. Gregory, John and A. Forrest, Warburton, &c. A temporary settlement was made from Sydney, at the Sound, in 1825. A private association in 1828 obtained land, on certain conditions, from the government, and established themselves at the Swan River in 1829. In that year a governor was appointed, but the crown-colony made little progress till 1839. Transportation hither ceased in 1867; but responsible government was granted only in 1890. The population at end of 1891 (without reckoning some thousands of aborigines) was 53,285; in 1898 it was estimated at 162,500. The revenue in 1891 was £497,670, and in 1897, £2,843,775; while the expenditure was £3,236,044. The debt is over £7,600,000.

The natural history is not unlike that of the rest of Australia, though some quadrupeds are peculiar, as the peragalea or native rabbit. The Moloch (q.v.) or mountain devil is an insect-feeding lizard. Alligators and turtles are found northward. The tarsipes is a peculiar honey-eating bird. The sea-mullet is preserved. Pearl-oyster beds are better off Cossack than at Shark's Bay. Trepang (q.v.), or bêche-de-mer, furnishes an export.

Baron von Mueller calls Western Australia the *floral land*. Timber of excellent quality abounds to the south-west, towards Cape Leeuwin. The jarrah, or mahogany, is the *Eucalyptus marginata*, which withstands white ants and ship-worms. The karri, or *E. diversicolor*, may be 100 feet to the first branch. The wandoo and tuart are hard white gums. York gums favour poor soil. The red gum, *E. calophylla*, yields much gum. The *E. ficifolia* displays a mass of crimson flowers. There are 150 acacias, of which the raspberry gum-tree is one. Sandalwood grows from Shark's Bay to the Bight. Poison plants may sometimes kill stock. The colony's vegetation is of the oldest type in Australia, and of far higher antiquity than that of Europe.

State aid is given to both schools and churches. The system in government schools is secular; in assisted schools, denominational. Higher education is aided by the state. While the average attendance at Church of England worship was 4820, it was 3880 at Roman Catholic, 3920 at Wesleyan, 1500 elsewhere.

There are six pastoral districts in the colony. The desert has some good oases. Pasturage land is leased by the government. Of 230,000 acres in crop, wheat and other cereals do well. The gardens have twenty-five sorts of fruits, grapes being fine and abundant. Land is sold in ten annual payments of 1s. per acre, subject to conditions of improvement. But the western portion only has moisture enough for ordinary husbandry.

Geraldine, in the Victoria district, had lead and copper mines in 1842. Tin, coal, and silver are also found; but the metal to which in late years 'Westralia' has owed most is gold, which began to attract attention about 1885. In 1886, 302 oz., of a value of £1147, were exported. In 1892 the value was £226,284; in 1893, £421,385; in 1894, £787,099; in 1895, £879,748; in 1896, £1,068,808; in 1897, £2,564,977. The total value of exports increased from £799,466 in 1891 to £3,940,098 in 1897—including wool, skins, timber, pearls, mother-of-pearl, gold, lead, and copper, sandalwood and eucalyptus oils, fruits, guano, dried fish, &c. Meanwhile the rapid growth of imports showed, in spite of some disappointments to gambling speculators, steadily increasing prosperity. The imports in 1891 had a value of £1,286,093, and in 1897 of £6,418,585. The length of railway increased from 200 miles to 1500, and there are 6000 miles of telegraph. Great efforts are being made to extend the railways by means of land grants. Camels help to serve in transport to the less accessible regions. Gold reefs extend over 1200 miles. Coolgardie and Kalgoorlie are great centres. Western Australia, after some hesitation, joined in 1900 with the other Australian colonies to form the Commonwealth of Australia.

See, besides the annual year-books and blue-books, works on Western Australia by Favenc (1887), Calvert (1893), Mennell (2d ed. 1894), Hart (1894), Tiele (1894), and J. M. Price, *The Land of Gold* (1896).

Western Empire. See EUROPE, Vol. IV. p. 465; ROME, Vol. VIII. p. 794.

Westfield, a town of Massachusetts, 9 miles by rail W. of Springfield, with a state normal school and varied manufactures. Pop. 9805.

Westgate-on-Sea, a western extension of Margate (q.v.), with an asylum for inebriates.

West Ham. See HAM, WEST.

Westhoughton, a town of Lancashire, 5 miles E. of Wigan, with manufactures of silk, cotton, and nails. Pop. (1851) 4547; (1891) 11,077.

West India Regiment. See COLONIAL CORPS.

West Indies, the great archipelago which extends in a vast curve from Florida in North America to the north coast of South America, separating the Atlantic Ocean from the enclosed waters of the Mexican Gulf and the Caribbean Sea. The name still bears testimony to the belief cherished by Columbus that when he reached in the Bahamas the outlying portion of the New World he was actually on or close to that old-world India which it was his design and hope to arrive at by sailing constantly westwards (see BAHAMAS, COLUMBUS). The name Antilles (q.v.), which is applied to the whole of the islands save the Bahamas, retains a trace of the belief in the old submerged continent of Antiglia. The islands include five larger islands and several more or less well-defined groups—the Bahamas, Cuba, Jamaica, Hayti, Porto Rico, the Virgin Islands, the Caribbee Islands, or Antilles proper, divided into Leeward and Windward. A list of these islands, showing their area, population, and political connection (independent, or belonging to Great Britain, the United States, France, Holland, and Denmark), is given at AMERICA, Vol. I. p. 223; and there are in this work separate articles on the greater islands and all the groups.

The fauna of these islands, which is Neotropical (see GEOGRAPHICAL DISTRIBUTION), and the geological structure make it probable that in Pleistocene times the islands formed a *terra firma* connecting North and South America. Calcareous rocks predominate on the whole, in some cases overlying granite and other igneous rocks; some of the minor Antilles are wholly volcanic; coral-reefs are found on many of them. The Bahamas are especially low-lying. All the islands except the northern Bahamas are tropical—the extreme limits being 10° and 27° N. lat.—and the climate corresponds to the geographical position, a fair degree of coolness being found at considerable elevations on the higher islands. The year is divided into wet and dry seasons, the principal rainfall being in October, and the longest dry season being from December till April. The islands are liable to severe hurricanes. The luxuriant and varied flora and the productions are best described in the articles on the several islands and groups.

Among great events in the history of the islands as a whole are the discovery (1492); the Spanish occupation; the introduction of negro slaves (1525) to take the place of the native Carib Indians, decimated by forced labour on the plantations; the development of the sugar industry; the gradual intrusion in the 17th century of French, English, and Dutch. Between 1635 and 1719 France secured Guadeloupe, Martinique, Grenada, and St Vincent; in 1632 Tobago and Curaçao became Dutch; in 1623–1763 England obtained possession of St Christopher, Barbadoes, Antigua, Dominica, and the Grenadines. England's growing power at sea forced France to cede St Lucia, Grenada, and St Vincent; the defeat of the French fleet by Rodney off Dominica in 1782 was one of the great naval battles of the world's history. Trinidad was long a bone of contention between France and England; Hayti (q.v.) has had a peculiarly chequered history; and in 1898 Spain relinquished Cuba and ceded Porto Rico to the United States. The West Indies were long haunted by the Buccaneers (q.v.), and some of them were used by Britain as penal settlements. The abolition of slavery in the English islands (1834–38) has been regarded by the planters as the cause of a great decline in prosperity—complicated of late by the sugar bounties (see SUGAR), which led to a commission and a grant in relief in 1899.

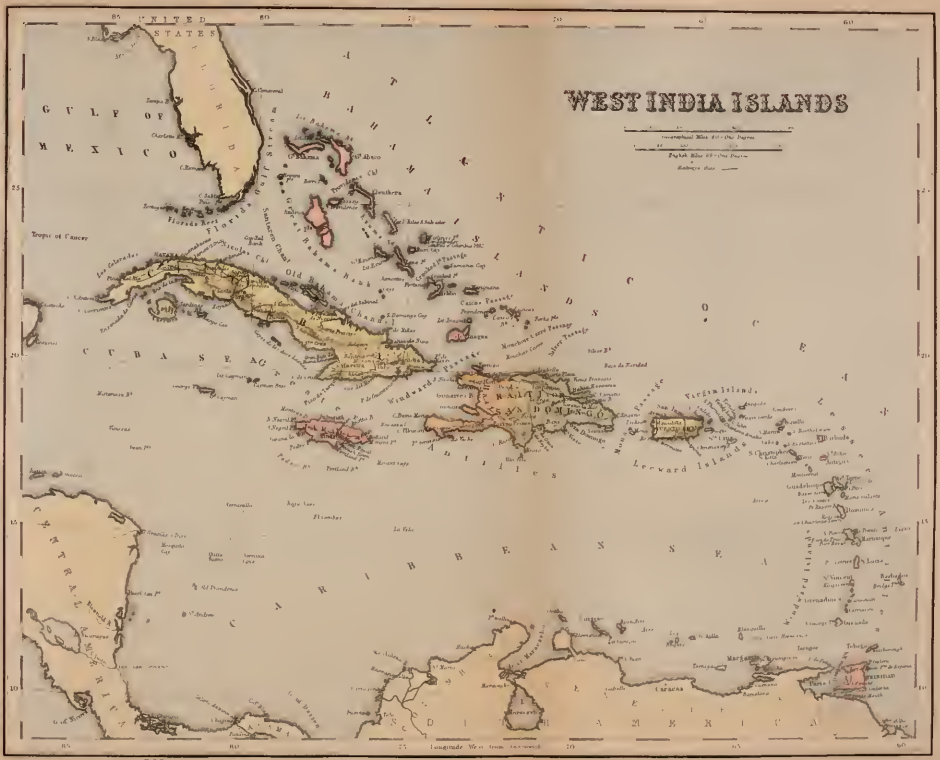
See, besides guidebooks such as those by J. H. Stark (full, with historical notes, 1898) and works on the several islands, Arthur Kennedy, *Story of the West Indies* (1898); M. G. Lewis, *Journal of a West India Proprietor* (1834); Champlain, *Voyage to the West Indies* (1859); A. Trollope, *The West Indies and the Spanish Main* (1859; new ed. 1869); Bates, *Central America, West Indies, and South America* (1878; new ed. 1882); Charles Kingsley, *At Last* (1869; new ed. 1889); Acosta, *Natural and Moral History of the West Indies* (Hakluyt Society, 1880); Eden, *The West Indies* (1881); Eves, *The West Indies* (new ed. 1891); Froude, *The English in the West Indies* (1888); Redway, *The West Indies and the Spanish Main* ('Story of the Nations' series, 1896).

Westinghouse Brake. See BRAKE.

Westland, a provincial district of New Zealand, was formerly part of Canterbury, and occupies the western portion of the Southern Island. It is 200 miles long by 30 broad. Pop. (1891) 15,882. The chief town is Hokitika (pop. 3000).

Westmacott, SIR RICHARD, R.A., an eminent sculptor, the son of Richard Westmacott, also a sculptor, was born in London in 1775. In 1793 he went to Rome to complete his studies, where he became in some sort a pupil of the celebrated Canova. His progress was rapid, and he carried off the highest prizes, in particular a gold medal given by the pope. In 1797 he returned to London, where his success in his art was not for a moment doubtful. In 1805 he was elected an A.R.A., in 1816 R.A.; and in 1835 the university of Oxford conferred upon him the honorary degree of D.C.L. Two years afterwards the honour of knighthood was bestowed on him. In 1827 he succeeded Flaxman as professor of Sculpture at the Academy. He died September 1, 1856. The works by which he is chiefly known are public monumental statues, in some of which he had much success. Of these it may suffice to mention his monuments in Westminster Abbey to Pitt, Fox, Perceval, and Addison, and in St Paul's to Sir Ralph Abercromby and Lord Collingwood. Many of his works in the antique classical manner are also of exquisite beauty and finish.—RICHARD WESTMACOTT, R.A., son of the foregoing, was born in London in 1799. He passed six years in Italy (1820–26), and after his return to London he gradually won a reputation for himself as one of the ablest sculptors of the day. He was elected F.R.S. in 1837, became A.R.A. in 1838, and R.A. in 1849. He succeeded his father in the professorship of Sculpture in 1859, a post which he filled with distinguished ability and acceptance. He died April 19, 1872. He contributed to three encyclopædias, and wrote a pamphlet on *Colouring Statues*, and a *Handbook of Sculpture* (1864).

Westmeath, an inland county of Leinster, Ireland, between Meath and Roscommon; greatest length NE. and SW., 45 miles; greatest breadth, 25 miles; area, 453,468 acres. The surface is for the most part level, the hilly district in the north not reaching a higher elevation than 710 feet. Geologically, Westmeath belongs to the great central limestone series. Of the numerous lakes which diversify the surface one chain belongs to the basin of the Shannon, which river, with its lakes, forms the western boundary; the other, towards the east, flows into the basin of the Boyne. The Royal Canal traverses the county. The climate is mild and not very moist. The soil is a deep loam, producing herbage especially suited to the fattening of cattle, which are largely fed. There is little tillage, and almost the only cereal crop is oats. The chief towns are the assize town and capital, Mullingar, and Athlone, which is partly



W & R CHAMBERS, LIMITED LONDON & EDINBURGH

in Roscommon. The county returns two members to parliament, one for the northern and one for the southern division. Westmeath anciently formed a portion of the kingdom of Meath (q.v.), but in the reign of Henry VIII. it was erected into a separate county, and at first included Longford (q.v.) and part of the King's County (q.v.). Many antiquities of the Anglo-Norman period, and some of the Celtic, chiefly tumuli and raths, are found in this interesting and picturesque county. Pop. (1841) 141,578; (1861) 90,879; (1881) 71,798; (1891) 65,028, 59,904 being Roman Catholics.

Westminster. Geographically speaking, the site of Westminster consists of an island in the Thames, named in some old records 'Thorney.' It stands opposite the spot at which the Watling Street from Chester met the Watling Street from Dover, the two ends being connected by a ford. On the Surrey side was a pavement—Stangate—and on the Middlesex side a low hillock—Tothill, which denotes a stopping-place where wayfarers could call—tout—for the ferry. On the building of London Bridge by the Romans traffic through Westminster ceased, and the Watling Street was diverted at what we call the Marble Arch. That Westminster was of early importance, possibly of earlier importance than London, is attested by the discovery of a mosaic pavement near the west end of the Abbey Church. Its position, at the point where the Watling Street emerged from the great Middlesex forest, and where, owing to the great width of the Thames, fording was safe and easy in fine weather, can be made out even on a modern map, where all contours have been so greatly altered by the embankment of watercourses, the levelling of roadways, and the building of houses. The land round the site of the future abbey was covered at every tide. A great estuary appeared at St James's Park, another opposite at Battersea; and at low-water, unless the volume of the Thames was much greater than it is now, the crossing between 'Thorney' and Stangate must have presented little difficulty. But of records on the subject we have none. The now chiefly obliterated geographical feature and the chiefly obsolete local names are our only guides. Westminster as we know it is a city in the newly-constituted county of London, which originally comprised a district extending from the walls of London almost to the village of Kensington. It has, however, been gradually reduced, and the modern parishes of St Bride, St Dunstan, St Paul, Covent Garden, St Anne, St Martin, St James, and St George, with some smaller precincts, have all been taken out of it. At present it consists only of the parishes of St Margaret and St John, and of an outlying district near Kensington Palace. The population exceeds that of the City of London, being 55,760 in 1891—a decrease of more than 4400 since 1881. The name contains a reference to an ancient abbey church, probably founded about the time of Offa, but refounded by Dunstan in the time of King Edgar, and supplied with regular monks. The exact date cannot now be ascertained, owing to a falsification of the only known copy of Edgar's charter, but it must have been about the year 971. The name further contains a reference to another minster, that of St Paul, which, it may be inferred, was older. Edward the Confessor lived chiefly at Westminster, and some of the buildings he provided for the monks may still be seen. He also rebuilt the church, and of his work an archway in the south transept may be identified. Of his palace no trace is left, but it stood, presumably, east of the abbey. The church was consecrated in 1065, and Mr Freeman was of opinion that the ill-fated Harold was crowned in it. The Conqueror was certainly crowned there, and in 1163 Edward the Confessor was canonised. In 1269 a new church, that which we now see, was consecrated, having been built by Henry III. in honour of the royal saint. The church was carried on by successive kings, and, in fact, was not completed till 1735, when the western towers were built, but the nave was finished under Richard II. The chapel of the Annunciation, or chantry of Henry V., was built in the reign of Henry VI. The Lady Chapel, or chapel of Henry VII., an elaborate example of the last phase of the old Gothic style, was built by Henry VIII., who subsequently suppressed the monastery and made Westminster a bishopric, since which the surrounding town has been reckoned a city. James I. set up the last of the royal monuments, those, namely, to his mother, Mary of Scotland, and to his predecessor Elizabeth. The north front was rebuilt by Wren, and was a beautiful example of his taste in Gothic. It was pulled down, and a new and less appropriate design by Mr Pearson substituted in 1890. The church is the burial-place of thirteen kings of England, including Henry III., Edward I., Edward III., Richard II., Henry V., Henry VII., Edward VI., James I., Charles II., William III., and George II., as well as of five queens in their own right, and the queens of many of the kings. In the reign of Richard II. the practice of burying court favourites and others in the abbey commenced, and the first poet to be laid in the south transept, often called the Poet's

Copyright 1892 in U.S. by J. B. Lippincott Company.

Westminster Abbey.

Corner, was Geoffrey Chaucer, who probably owed this distinction as much to the fact that he was clerk of the works in the abbey, and occupied a house on the site of the chapel of Henry VII., as to his poetry. In the same transept are buried Spenser, Dryden, Garrick, Johnson, Dickens, Browning, Tennyson, and others of less note; and many monuments commemorate poets and literary men buried elsewhere. The first Lord Lytton was buried in the chapel of St Edmund. Handel's grave is in the south transept, Dean Stanley's in the chapel of Henry VII. The north transept contains the graves of Mansfield, the two Pitts, the three Cannings, and other statesmen. In the nave are buried Newton, Scott, Street, Livingstone, Ben Jonson, Sir Charles Barry, Robert Stephenson, and Charles Darwin. Nearly all English kings and queens have been crowned here, and since Edward I.'s reign have used the chair holding under its seat the Stone of Scone (see CORONATION).

The abbey did not produce any remarkable literary men, though a chronicle is attributed to one Matthew (q.v.) of Westminster, of whom nothing is known. The last lord abbot, called Boston, as Benson became the first dean. The chapter includes six canons, one of whom is archdeacon.

Shortly before the dissolution of the monasteries William Caxton had set up the first English printing-press in the Almonry, a little to the west of the western front of the abbey. He continued to print books here until his death in 1491. He is commemorated by a monument in the church of St Margaret, where he is buried. The exact site of the Almonry and chapel of St Anne may be identified by a costly but ill-designed red granite pillar, which serves to remind the visitor that the sign of Caxton's house was the Red Pale.

The abbey remains are numerous, some of them being in the occupation of the school; but all the gates, among them the abbot's prison, in which Raleigh spent his last hours, have disappeared, except part of the gate into College Street from Dean's Yard. The cloisters, except for restorations, are unusually perfect, and the domestic buildings of the Confessor's period, and therefore unique in England, are extensive, and would be more so but for the vandalisms of those in authority. It is a singular fact that the best preserved of the domestic buildings of Westminster Abbey are those of which the school has the custody, the fatal injuries to Ashburnham House and to the Dark Cloister having been inflicted by the dean and chapter. The Abbot of Westminster was a peer of parliament, took precedence of all other English abbots, and had an income which would be reckoned at about £60,000 of our money. He had many privileges in common with the Benedictine monks over whom he ruled, and had the custody of many of the crown jewels; and of the whole regalia at the time of a coronation. The dean has succeeded to some of the privileges and more of the duties, and the heaviest part of such a ceremony as the coronation of George IV., or of the Jubilee of Queen Victoria, fell upon him. Abbot Boston or Benson surrendered his house to Thurlby, who for ten years was the first and last Bishop of Westminster. A few years later the dean obtained the old house, all but the hall, which had been given to the school; and the lord of the manor of the church of St Peter resides in his manor-house in the reign of Queen Victoria as he resided in the reign of Queen Elizabeth. While nothing remains to Westminster of the original 'terra Sancti Petri' except St Margaret's and St John's, an outlying corner, probably representing the manor of Neyt, and now known, but only since the reign of William III., as Kensington Gardens (see KENSINGTON), is still reckoned in the parliamentary borough of Westminster. The palace of Kensington is within the boundary. Manorial rights are rather shadowy; but a complete account of the manor of Westminster, with reference to the points where, in the course of ages, it came into contact with municipal life, would be interesting. The Dean of Westminster is still, at least nominally, lord of the manor, and appoints a steward, who is generally some nobleman of high rank. There are also a bailiff and sixteen burgesses. The deanery contains the 'chamber called Jerusalem,' probably from a view of the holy city among its original decorations, approached by the 'chamber called Antioch,' for a similar reason. Jerusalem forms a chapter-house, the original chapter-house in the east cloister having for centuries been used by the House of Commons, and afterwards for the storage of state papers. It is now crown property, and having become ruinous it was almost rebuilt by Sir Gilbert Scott, but contains still some part of its ancient decorations. The school closely adjoins the abbey, and the great school-room is part of the monk's dormitory, an interesting room, much disguised by restorers, but apparently containing remains of the Confessor's buildings. Close to it is a beautiful chamber in the style of Inigo Jones, or Webb. It is known as Busby's Parlour. Farther to the south, and looking into the College Garden—the 'college' here refers to the dean and chapter, not the school—is Lord Burlington's exquisite school dormitory; the interior was never finished, and is very plain. But the most interesting of the post-Reformation buildings belonging to the school is Ashburnham House, which was built either by Inigo Jones or by Webb from his designs. It was much spoilt by the canons who held it as a residence, but the staircase, of complicated design, and two rooms above are in a very superior style. The exterior is plain. The house stands on part of the site of the abbey 'misericorde,' and there are remains of a buttery hatch in the hall. The deposed abbot lived here as dean, while the bishop occupied the abbot's old house, now the deanery. Some eminent men have been masters of the school, which was founded as St Peter's College by Queen Elizabeth in 1560, among them being Camden, the Elizabethan antiquary, Busby, and Vincent Bourne; and among the scholars have been George Herbert, Cowley, Dryden, Prior, Cowper, and Southey, among poets; Wren stands alone among artists; but the list of statesmen includes Warren Hastings, Lord Mansfield, and Lord Russell; Gibbon and Locke represent literature.

The churches of Westminster are now very numerous, but the original parish churches are only St Margaret's and St John's. St Margaret's seems to have first been built a few years before 1140. The people had previously worshipped in the abbey church, and in Domesday the whole of the abbot's manor, which extended then to the walls of London, is designated as 'St Peter's.' St Margaret's has never been remarkable for its architectural features, but as we see it now is in a poor style of Gothic, with many modern additions, such as a porch and new window tracery. The famous Scrope and Grosvenor controversy, when Chaucer gave evidence, in 1386, was held in St Margaret's Church. The headless body of Sir Walter Raleigh was buried in it in 1618. The east window is old Dutch. The church is supposed to be the special charge of the House of Commons. The boundary line between the parishes of St Margaret and St John passes between the two Houses of Parliament, the lords being in St John's, the church of which was consecrated in 1728. It is an unsightly structure, remarkable for four massive corner towers, rendered necessary by the insecurity

of the building, which is on a swampy site. The architect was Thomas Archer. All the royal palaces of London used to be in Westminster, but since the parish has been dismembered only Whitehall, Kensington, and the Houses of Parliament can be reckoned within the boundaries. St James's is in St Martin in the Fields, Buckingham Palace is partly in St James's, and partly in St George's, Hanover Square. Of Whitehall but little remains. A few fragments of Gothic windows were till 1890 still visible in old houses behind Scotland Yard. The chief relic was till lately the Chapel Royal, Whitehall. Henry VIII. first made a palace here. In 1512 he was burnt out at Westminster, and, having seized Wolsey's house at Charing Cross, he made an arbitrary series of regulations calculated to cut the inhabitants whose houses were north of a line drawn through the middle of the Royal Horse Guards off from their parish church. Being annoyed at funerals passing from one end of the divided parish to the other, he eventually built St Martin's. In 1536 he persuaded his subservient parliament to pronounce the old palace to be only 'a member or parcel' of the new palace at Whitehall. He dwelt much here, and added both to the buildings and the gardens. Holbein is said to have constructed the gate, the stones and terra-cotta of which were subsequently transferred to the Long Walk, Windsor Park, where they slumber in peace under a thick layer of turf, having never been set up again. (Views and plans are to be seen in Smith's *Westminster*.) James I. constantly used Whitehall, and set Inigo Jones to design him a great palace on the site. By this design the palace was to stand on both sides of the road to Westminster. Nothing was ever built except the chapel, as it was till lately called, then a banqueting hall. Inigo made a second design for Charles I., in which the palace was to be only half the size, and was not to cross the road. Nothing was ever done, but it is necessary to mention both designs, as most writers mix them up. On the street front of this banqueting house are some blank windows. One of these, the fourth from the north end, was broken through to provide an exit from the ground-floor of the hall to a ladder outside, leading to the scaffold, and by this passage Charles I. went to his doom. The broken wall was identified behind the facing stones some years ago (see Jesse, *Court of England*, vol. i. p. 466). There is much about Whitehall in the diaries of Pepys and Evelyn. The old parts of the palace were burnt in 1697, and never rebuilt, but it is said that a hall of Wolsey's is actually enclosed in the buildings of the Treasury, having been continually altered but never pulled down. The Chapel Royal was closed in 1891, with a view of turning the building into a 'United Service Museum.' It is the fashion just now among the architects of the so-called Gothic revival to decry the merits of this little fragment of Inigo Jones's design, but it is safe to pronounce it the most beautiful building of its size in London.

The present 'palace of parliament' stands on a site consecrated by nearly six centuries of representative institutions. It may have been originally selected by Edward the Confessor, in whose reign the cessation of all further fear of a Danish incursion made it possible for the king to reside habitually without the protection of walls. But according to the local tradition it was Canute or Knut who first lived at Westminster, and here he rebuked the tide. No doubt even the king could not go a hundred yards on foot from Thorney without encountering a tide or a tidal stream. One of the rivulets, the Tyburn, here divides into a kind of delta. Two other brooks surrounded the sacred precincts of the monks, and at least two more divided the mighty Dane from the wide mere of St James's Park. And all these were tidal, as the name of one of them, Mereflete, denotes. Notwithstanding the lowness of the situation thus described, it became the chief residence of successive kings, and, in consequence, the headquarters of the courts of law. The king himself at first heard cases, and, theoretically, continued to hear them until a very late period, seated in the hall of the palace surrounded by his chaplains, who advised him on points of law. The king's exchequer, too, sat in the same place, and certain barons were early appointed to see to matters relating to the royal revenue. There are many other things which connect Westminster with our legal history, but this is not the place in which to detail them. The palace, probably from the time of the Confessor, if not before it, had numerous great public chambers and halls, where cases could be heard, where money could be received and placed in safety, where great court functions could be carried out, where ambassadors could be entertained, and banquets given to hundreds of guests together.

As the centuries went on these chambers formed not a homogeneous house of compact plan such as might be our conception of a palace, but a village of single apartments, such as the Painted Chamber, the Whitehall, the White Chamber, the Star Chamber, the Court of Requests, St Stephen's Chapel, and the Great Hall. To the westward of the Great Hall were the law-courts, and to the north and east the royal apartments. William Rufus rebuilt the Confessor's hall on an immense scale, with round-headed double window like those still to be seen in the White Tower, some of which are still in existence, but covered up in the masonry at the south-eastern corner. There was a flat roof, supported by rows of oak pillars. Henry III. improved the palace greatly, but kept to the ground-plan laid down by the Confessor. Richard II. transformed the hall. Leaving the old walls standing, he buttressed them strongly, and raised over them the magnificent roof of oak which is still extant and intact. It is 92 feet high. The length of the hall is 290 feet, its breadth 68 feet. In 1512 a fire took place in the royal apartments, and Henry VIII. removed the court first to Bridewell and then to Whitehall, but the law-courts remained at Westminster, as did, oddly enough, the royal nursery, which so closely adjoined the hall that, before the courts were pulled down, the judge's robing-room of the Queen's Bench was the last of the nursery series, adorned with pictures of Heaven, Paradise, Purgatory, and Hell, after which each was called.

The law-courts were fixed in Westminster Hall in 1224. They were frequently rebuilt, but were recently swept away without due consideration, the old buttresses being left bare, and many ancient remains destroyed under the ignorant idea that they formed no part of the original building. Finally, lest any mistake possible should be left uncommitted, a modern professor of revived Gothic was permitted to cover the naked flank of the old hall with a building which makes us regret the courts more than ever. Many of the greatest events of English history, and all the greatest pageants have had their place in this old hall. Here the throne was set up for Henry Bolingbroke to ascend as soon as the constituent assembly had proclaimed the deposition of Richard. Here Sir John Oldcastle, Lord Cobham, was tried and condemned. Here, successively, the Duke of Somerset and his rival, the Duke of Northumberland, and a little later, the Duke of Norfolk, were all tried and condemned. Here Strafford was condemned in the same place occupied by his royal master a few years later. The seven bishops were

here acquitted, and here the trial of Warren Hastings, the cause of so much wasted eloquence and turgid rhetoric, dragged on wearily for seven long years. In 1834 a conflagration was caused by careless workmen, who, having orders to destroy some fagots of obsolete 'tally sticks,' burned them in the stove of the House of Lords (the old Court of Requests). The result was the destruction of all that remained of the ancient palace, except the hall, the cloister of St Stephen's Chapel, and the crypt. All were worked into Sir Charles Barry's new design for the Houses of Parliament; but the ancient features of the crypt have since been removed, and the curious little chapel of St Mary, which dates from the reign of Edward I., looks like a second-class gin-shop. The whole design of Sir Charles Barry was formed upon the necessity of preserving Westminster Hall, and of making the new building to conform to it. The result is, with the single exception of Windsor Castle, the most successful attempt to build in a revived Gothic style. This is not the place for criticism, but the reader will observe that Barry, whatever his shortcomings, had learned proportion in his Palladian studies, and never depended upon detail. The best parts are the interior courts where there is no ornament, but where the symmetry is very marked. The way in which the old hall is worked in is masterly, the more so as, when we look at the plan, but only when we look at the plan, we perceive that it is not parallel with any of the new buildings. Eastward of the hall the old cloisters of 'fanwork' vaulting are utilised as an entrance-gallery for the members of the House of Commons, and have a doorway opening into the hall. At the south end the site of St Stephen's Chapel forms a grand entrance for both Houses, a beautifully groined gallery, with some interesting statues by Foley, and some others, leading to the Central Hall, a fine octagon, never fully completed. From this point galleries more or less spacious, ornamented with frescoes, lead on the left to the House of Commons, and on the right to the House of Lords. The former is a handsome chamber approached by a lobby, which forms a cube of 45 feet, the House itself being 90 feet by 45, and 45 high. Some modifications of these dimensions have been made from time to time to improve the acoustic qualities of the chamber. The Perpendicular style is rigidly adhered to all through. Turning southward we reach the Peers' Lobby, which is of the same dimensions as the other, but a blaze of gilding and colour. The House of Lords is also very gorgeous, with figured windows, frescoes by Dyce and others, arms of successive chancellors in colour, bronze statues of the barons who extorted Magna Charta, an endless variety of gilt-carving, wide, low red-leather seats, and at one end, under a gilt canopy, the throne, flanked by smaller seats intended originally for Prince Albert and the Prince of Wales. On either side behind the throne are doors which lead into the Princes' Chamber, a kind of robing-room, and beyond it we reach the great and unmeaning Royal Gallery, the object of which is not apparent, unless it be to exhibit the skill of Maclise, who painted on its walls gigantic frescoes of the 'Death of Nelson,' and the 'Meeting of Wellington and Blücher after Waterloo.' The Victoria Tower rises to a height of 340 feet.

Westminster Bridge as we see it is not a very interesting structure, being chiefly constructed of cast-iron. The first bridge here was opened in 1750. It was very picturesque, and figures in some of Turner's pictures, as well as in Wordsworth's sonnet. The architect was Labelye, a Swiss. The Thames is, as we saw above, very wide here, and the bridge was at least 300 feet longer than London Bridge. The present bridge was designed by Page, and completed in 1862. Many great changes have taken place in Westminster. The clearing out of back slums, and the completion of Victoria Street, have created a quarter of rather fashionable residences. Various prisons have been removed, trees have been planted, and palatial houses and hotels have been built. Unfortunately, the architectural taste needed has not been equal to the demand, and a walk from the Abbey to Victoria Station will reveal some ten or a dozen of the most hideous but most costly buildings in the world, and not a single good one. One of the best is a new town-hall, in which, according to Mr Wheatley (*London Past and Present*, vol. iii. p. 461), there are preserved thousands of manuscript books and records, extending from 1464 to the present day. Several charters have also lately been brought to light, the earliest being dated in the fortieth year of Henry III., 1256. By the last Reform Act the old borough of Westminster, which was nearly conterminous with the ancient boundaries of the abbot's manor, was divided, and Westminster, with one member, consists of the parishes of St Margaret and St John. The poll used to be taken in the porch of St Paul, Covent Garden, and lasted sometimes forty days, popular excitement increasing every day.

Of the numerous books on Westminster may be mentioned Widmore's *Enquiry into the Time of the First Foundation of Westminster Abbey* (1743); Bardwell's *Westminster Improvements* (1839); Brayley and Britton, *The Ancient Palace and Houses of Parliament* (1836); Ackermann, *Westminster Abbey* (1812); Neale and Brayley, *Westminster Abbey* (1818); Dart's *Westminster Abbey* (n.d.); Sir Gilbert Scott and others, *Gleanings from Westminster Abbey* (1863); Dean Stanley, *Memorials of Westminster* (1868); Forshall, *Westminster School, Past and Present* (1884); *Westminster Abbey*, by the present writer (2d ed. 1891); Barker and Stenning, *The Westminster School Register* (1893); Sir W. Besant, *Westminster* (1895); Mrs Murray Smith, *Annals of Westminster Abbey* (1895).

Westminster Assembly, or Assembly of Divines, appointed by the Long Parliament for settling the doctrine and government of the Church of England, consisted of 121 clergymen and 30 laymen—10 of whom were lords and 20 commoners—together with 4 clerical and 2 lay commissioners from the Church of Scotland. Among the more distinguished of the divines were Usher, Saunderson, Reynolds, Brownrigg, Ward, Twisse, Lightfoot, Gataker, Burges, Goodwin, Calamy, and Nye; of the laymen, Selden, Prideaux, the two Vanes, Rouse, Pym, Whitelocke, St John, and Maynard. The Scottish divines were Henderson, Gillespie, Rutherford, and Baillie. Thirty-five of those whose names were contained in the ordinance calling the Assembly, which was dated 12th June 1643, never appeared at the discussions, one or two of them having died about the time of the first meeting, and the others fearing the displeasure of the king. To supply the place of these absentees, some additional members, called the superadded divines, were summoned to attend. This notable Assembly held its first meeting on 1st July 1643, and continued to sit till 22d February 1649, during which time it met 1163 times. Its most important work was concluded long before. One of the first things it did was to sanction the *Solemn League and Covenant*, against which Dr Burges alone stood out for several days. The Presbyterians formed a large majority, and exercised a corresponding influence. In doctrine the members were almost unanimous; but on the subject of church government opinions extremely opposite were maintained with keenness, especially on the question touching the sphere and limits of the civil power in matters ecclesiastical. The principal

fruits of its deliberations were the *Directory of Public Worship*, submitted to parliament April 20, 1644; the *Confession of Faith*, October and November 1646; the *Shorter Catechism;* and the *Larger Catechism*, 22d October 1647. These several formularies, which contain a clear and rigid embodiment of Calvinistic theology and Presbyterian church government, constitute to this day the authorised Presbyterian standards. The *Directory of Public Worship* was ratified by both Houses of Parliament, October 2, 1644, and the doctrinal part of the *Confession of Faith* in March 1648.

See Baillie's *Letters;* Lightfoot's *Journal;* Hetherington's *History of the Assembly* (1843; 6th ed. 1891); Masson's *Milton* (vol. ii. 1871); Gardiner's *History of the Civil War* (3 vols. 1886–91); *Minutes of the Assembly*, edited by Mitchell and Struthers (1874); A. F. Mitchell's *Baird Lectures* (1882). See also CONFESSIONS, COVENANT, PRESBYTERIANISM.

Westmorland, a northern county of England, bounded by Cumberland, Durham, Yorkshire, and Lancashire. With a very irregular outline, it has an extreme length from north to south of 32 miles, an extreme breadth from east to west of 40 miles, and an area of 505,864 acres or 790 sq. m. The surface is mountainous, the highest summits being Helvellyn (q.v., 3118 feet) on the Cumberland boundary, Bow Fell (2959), Fairfield (2950), Dufton Fell (2803), and Dun Fell (2780). The western portion of the county belongs to the Lake District (q.v.), its lakes including Windermere (q.v.) on the boundary with Lancashire, and Ullswater (q.v.) on that with Cumberland, besides Grasmere, Howes Water, Rydal Water, &c. The moorlands —to which Westmorland owes its name—are numerous and extensive; but along the courses of the Kent in the south and the Eden in the north (the principal streams) there are tracts of fertile land. Of the 400,000 acres in cultivation less than 90,000 are under corn; woods and plantations cover 17,000 acres. The climate is moist and mild, but with often much snow in winter. Coal, lead, copper, slate, and graphite are the chief mineral productions. Westmorland, which is in the diocese of Carlisle, comprises four wards, 109 parishes, and the towns of Appleby, Ambleside, and Kendal. Its county councillors number fifty-six, and it returns one member for each of its two divisions—the Northern or Appleby and the Southern or Kendal. Worthies, besides those noticed under the LAKE DISTRICT, have been Bernard Gilpin, Catharine Parr, Ann Clifford, Countess of Pembroke, Bishop Watson, and Sir J. G. Wilkinson; and Clifton Moor was the scene of a Jacobite skirmish (1745). Pop. (1801) 40,805; (1841) 56,454; (1881) 64,191; (1891) 66,098. See the *Quarterly Review* for Jan. 1867; works cited at LAKE DISTRICT; Bellasis, *Westmorland Church Notes* (1892); and *History* by R. S. Ferguson (1894).

Weston-super-Mare, a fashionable watering-place of Somersetshire, on the Bristol Channel, 20 miles SW. of Bristol. Grown from a fishing-village since 1805, it is sheltered by rocky, fir-clad Worle Hill (306 feet); commands a splendid view over to Wales; and has an esplanade (begun 1825) 3 miles long, a promenade pier (1867) 1040 feet long, the Prince Consort gardens, a sanatorium, potteries, &c. Pop. (1851) 4034; (1891) 15,873.

Westphalia, a name given to a duchy and a kingdom, and now to a Prussian province, is derived from the *Westfalen*, a western tribe of Saxons, dwelling in the region of the Ruhr and Lippe rivers, as distinguished from the Ostfalen, nearer the Elbe. About 1180 it came under the Archbishops of Cologne, as Dukes of Westphalia. It was the headquarters of the Vehmgerichte (q.v.). Under the Emperor Maximilian part of old Westphalia with parts of Oldenburg and Hanover was made a 'circle' of the empire; while the duchy fell into the circle of the Lower Rhine. In 1801 all the country west of the Rhine was made over to France, and the duchy granted to the Duke of Hesse-Nassau as compensation for his losses to the west of the Rhine. In 1807 Westphalia, with parts of Hesse, Hanover, Brunswick, and Saxony, was made into a kingdom for Jerome Bonaparte, and designed to be the centre of the Confederation of the Rhine (q.v.). In 1813 the kingdom came to an end, and the Congress of Vienna assigned the present province of Westphalia to Prussia. This province has an area of 7892 sq. m. (larger than Wales) and a pop. (1890) of 2,428,661, of whom 1,145,627 were Catholics. The northern portion belongs to the great north German plain, and is not fertile; the south is hilly, with fertile valleys. Westphalian hams are still in high repute; but Westphalia's peculiar wealth lies in its mineral treasures—iron, zinc, copper, sulphur, with lead, antimony, &c. Iron-working is largely carried on, and linen-weaving has been an important industry since the 14th century—Bielefeld being the great centre. Münster has cotton-works.

The peace of Westphalia, concluded at Münster and Osnabrück 24th October 1648, brought the terrible Thirty Years' War (q.v.) to an end. The main advantage to the Protestant party was the securing of religious toleration. Both parties agreed to abide by the distribution of territories as at 1624. The Lower Palatinate was restored to the son of the Elector Palatine; the Upper Palatinate to Bavaria. Part of Alsace was definitively ceded to France; western Pomerania, Bremen, and Verden fell to Sweden, which in virtue thereof became a member of the Holy Roman Empire. Brandenburg and Hanover obtained some secularised church lands; and the independence of Holland and Switzerland was formally recognised. The sovereignty of the different states of the empire was recognised to an extent that seriously weakened the strength and unity of the empire.

West Point, site of the United States Military Academy, and of a ruined fortress dating from the war of independence, on the right bank of the Hudson River, 48 miles by rail N. of New York. The Military Academy is on a plateau 188 feet above the river, surrounded by the bold scenery of one of the finest river-passes in the world. The forts and a river chain were taken by the British in 1777, but abandoned after Burgoyne's surrender, and stronger forts were built, which General Arnold bargained to betray—a plot foiled by the arrest of Major André. The academy was established in 1802. Education there is gratuitous, the government allowing the cadets $540 per annum. One cadet may be appointed by the representative of each congressional district, two by the senators of each state, and thirty by the president. The cadets are organised for military purposes into a battalion of four companies, officered from among themselves. The discipline is exceedingly strict, no less than three hundred offences being scheduled, with their corresponding punishments. Only one furlough of two and a half months is allowed during the four years' course. In summer all but the new sophomore class are encamped for training. The standard of education is very high. The entrance examination, though confined to the common English branches, is so severe that many candidates each year are rejected; and of those that enter less than half ever graduate. Besides seven professors, the staff includes thirty assistants, officers selected from the army. It may be added that post-graduate schools have been established—for artillery at Fortress Monroe, for infantry and cavalry at Fort Leavenworth, and for the engineers (which the first five of each graduating class have the privilege of entering) at Willet's Point.

Westport, a seaport of County Mayo, at the head of Clew Bay, 13 miles SW. of Castlebar by rail; pop. 4469.

West Prussia. See PRUSSIA.

West Troy, a town of New York, on the Hudson, opposite Troy. It has various manufactures, and contains a national arsenal. Pop. (1890) 12,967.

West Virginia, a state of the American Union, the thirty-fifth in area and twenty-eighth in population, is the most irregular in form of all the states. Nearly all the boundary lines follow the courses of rivers or the crests of mountain-ranges. In the north a narrow wedge-shaped strip of land, called the 'Pan-handle,' projects along the Ohio River between the states of Ohio and Pennsylvania. The eastern edge of the 'Panhandle' and a portion of the northern boundary adjoin Pennsylvania. The remaining portion of the northern boundary is formed by the Potomac River, which separates the state from Maryland; and that state also forms a part of the eastern boundary. Virginia lies to the south and south-east, and on the west are Kentucky and Ohio. Area, 24,780 sq. m.

Copyright 1892 in U.S. by J. B. Lippincott Company.

In the north-east a small portion of the state belongs to the Shenandoah valley. Thence westward and south-west to the Big Sandy River stretches a narrow belt, called the 'mountain region,' formed by the western ridges of the Appalachian system. This portion of the state consists of sharp parallel ranges interspersed with narrow fertile valleys which increase in width toward the west. In the north the streams are tributary to the Potomac, but toward the south they frequently cut through the mountain-ridges in deep gorges, flowing toward the west or north-west to the Ohio River. The massive sandstone summits of the mountains have been so cracked and fissured by the original upheaval and by subsequent erosive action upon the softer strata beneath that the streams have carved cañons in some cases nearly 1000 feet in depth. To the west of this region lies a broad belt known as the 'hilly region,' a portion of the Appalachian or Cumberland plateau. It has suffered a vast amount of denudation, and its diversified structure is entirely the result of erosion. It comprises a multitude of hills with V-shaped depressions in which the streams flow, generally toward the west. If the streams follow a north and south course, they cross this elevated region in deeply eroded valleys and cañons. In some cases there are fertile bottom lands of considerable extent, and the hills above the valleys form broad flat-topped plains, surmounted, where some outcropping rocks have resisted the destructive agencies of rain and frost, by elevations which are higher than portions of the mountain region. There is a gradual descent toward the Ohio River, which, however, throughout much of its course flows between high sharp-backed hills. A large part of the state is well wooded, and the timber resources are of great importance. The climate is free from extremes, and is remarkably pure and healthful. The abundance and equable distribution of the rainfall, together with the general fertility of the soil, afford excellent opportunities for agriculture. In the mountain region there is an abundance of fine pasturage, and the annual product of butter and cheese is very large. The most valuable natural resources of West Virginia are its coal and iron. The great Appalachian coal-field passes southward from Pennsylvania and covers almost the entire state. In area it is much greater than the whole coal region of Great Britain and considerably larger than the Pennsylvania field. The coal is of the highest quality, and embraces all grades of bituminous, steam, cooking, and gas coals. The erosion of the surface, already mentioned, has left the coal seams in such condition that they may be worked with great economy, and the increased facilities for transportation have greatly stimulated mining operations. West Virginia ranks third among the states in the output of coal (12,772,000 long tons in 1897), and second in the production of coke. The pig-iron and steel products are increasing, and in the manufacture of iron and steel nails the state holds a high rank. Salt and petroleum-oil are important natural products. In the south and south-east are numerous mineral springs, of which the White Sulphur Springs are the most widely known.

The state contains fifty-five counties, and returns four representatives to congress. The chief cities are Wheeling, Charleston, the capital, Huntington, and Parkersburg. There is an efficient system of free public schools and normal schools. At Morgantown is situated the state university, and there are numerous private schools and several institutions of higher learning. Until the time of the secession of Virginia that state included West Virginia; but the inhabitants of the northern and western counties remained loyal to the federal government, and in 1863 West Virginia became a separate state, and was admitted to the Union. Pop. (1870) 442,014; (1890) 762,794; (1900) 958,900.

Westward Ho, on the coast of North Devon, 2½ miles W. of Bideford, owes not merely its name but its existence to Charles Kingsley's Elizabethan romance (1855), which attracted swarms of visitors to North Devon. For their accommodation this pretty cluster of villas and lodging-houses, with its church, hotel, club-house, and college, has sprung up since 1867. The bathing facilities are excellent, and it is a great resort of golfers. The village is in the parish of Northam.

Wetherell, ELIZABETH. See WARNER, SUSAN.

Wetstein, JOHANN JAKOB, a great New Testament scholar, was born in Basel, March 5, 1693. At an early age he gave himself to the studies of his life, and after travelling in France and England he returned in 1720 to become assistant to his father in St Leonard's Church at Basel. He continued the study of the New Testament text, and his boldness and originality soon brought him under suspicion of heterodoxy. His rejection of the *θεός* for *ὅς* in the *textus receptus* of 1 Tim. iii. 16—now admitted by all who know anything of exegesis—was denounced as an attempt to destroy one of the buttresses of Christ's divinity, and Wetstein was deposed for alleged Socinianism (1730). But in 1733 he was called to the chair of Church History in the Remonstrants' College at Amsterdam, and there he lived till his death, March 22, 1754. The prolegomena to his famous edition of the Greek Testament appeared anonymously in 1730; the text followed in two volumes folio, 1751–52. See L. Meister, *Helvetische Szenen der neueren Schwärmerei und Intoleranz* (Zur. 1785).

Wette. See DE WETTE.

Wetter, LAKE (*Vetter*), after Lake Wener (q.v.) the largest lake in Sweden, lies in Gothland, 25 miles SE. of Lake Wener. It is 70 miles long, 13 miles in average breadth, has an area of 850 sq. m., is 370 feet in greatest depth, and is 270 feet above the level of the Baltic. It receives about ninety small tributaries and has an outlet in the Motala River, which, flowing eastward, maintains the communication of the lake with the Baltic. It is fed mainly by springs from beneath. Its waters are clear, and of a beautiful green colour, and it is surrounded by lofty romantic shores, almost unbroken by bays. It is remarkable

for an irregular alternation of risings and fallings, and for an occasional violent undulation in perfectly still weather. An intricate chain of small lakes, continued westward by the Göta Canal, connects it with Lake Wener, and thus with the Cattegat. Lake Wetter contains few islands.

Wetterhorn ('Peak of Tempests'), a lofty mountain of the Bernese Oberland, east of the Grindelwald, 10 miles SE. of the Lake of Brienz. The three peaks of the Wetterhorn are respectively 12,149, 12,165, and 12,110 feet high, and were first ascended in 1844 and 1845.

Wetzer, Heinrich Joseph, joint-editor with Benedikt Welte of the great Roman Catholic theological encyclopædia, was born at Anzefahr in Hesse, March 19, 1801, studied at Marburg, Tübingen, and Paris, became professor of Oriental Philology at Tübingen in 1830, and died in Freiburg, November 5, 1853. He began the publication of the *Kirchen-Lexikon der Katholischen Theologie* in 1846; the 12th volume appeared in 1860. A new edition was begun by Hergenröther, and continued by F. Kaulen (1882 *et seq.*).

Wetzlar, a small town of Rhenish Prussia, charmingly situated on the Lahn, 40 miles by rail N. of Frankfort-on-the-Main; pop. 7844. Part of its old cathedral dates from the 13th century. Wetzlar is the scene of the *Sorrows of Werther*.

Wexford, a maritime county of the province of Leinster, bordering on Wicklow, Carlow, Kilkenny, and Waterford; greatest length, 55 miles; greatest breadth, 30 miles; area, 573,200 acres. The coast-line is irregular, and very dangerous for shipping. The headland called Carnsore Point is the south-eastern extremity of Ireland. The greater part of the surface is level, but Mount Leinster, the highest point of the mountains of the border, is 2610 feet high. The principal river is the Slaney, which enters the sea through Wexford Harbour; the Barrow is part of the boundary. In its geological structure Wexford belongs to the eastern clay-slate tract; granite is found in the south-east of the county, and in some of the detached hills, as are also beds of greenstone. The soil varies from light and sandy to stiff clay, but the county has a verdant luxuriance. There are but few and inconsiderable manufactures, and the trade is chiefly in the export of agricultural produce, especially barley; butter, cattle, pigs, poultry, and eggs are also exported in large quantities. The fisheries are valuable. The principal towns are Wexford, Enniscorthy, New Ross, and Gorey. The maritime position of Wexford laid it open early to the incursions of the Danes. It was the first landing-place of the English, and formed part of the tract granted to them by MacMurrough. During the civil wars which followed 1641 Wexford was the scene of frequent contests; and in the insurrection of 1798 it formed the theatre of the only formidable conflicts of the peasantry with the regular troops. There are numerous relics of antiquity, Celtic as well as Anglo-Norman, including many old castles, and the monasteries of Dunbrody, Tintern, and Ross. Wexford returns two members to parliament. Pop. (1841) 202,196; (1861) 143,594; (1881) 123,854; (1891) 111,536, of whom 102,002 were Roman Catholics.

Wexford, the capital, a seaport and municipal borough, is situated at the mouth of the river Slaney, 93 miles S. of Dublin by rail. The estuary of the Slaney forms Wexford Harbour, which, though spacious, is shallow and impeded by a bar. The town has several churches, Catholic and Protestant, a convent and nunneries, and conventual schools. Parts of the old fortifications and of St Selsker's priory remain. The town is extremely ancient, and was occupied by the Danes as one of their strongest settlements; and from the time of the invasion it became an English stronghold against the native population. During the civil wars of 1641 it was occupied by the confederated Catholics, but was taken by Cromwell in 1644. The insurgents of 1798 also had possession of it for a short time. Till 1885 it returned a member to parliament. Pop. (1881) 12,163; (1891) 11,541.

Weyden, Rogier van der (1400–64), Flemish painter, born at Tournay, was a successor of the Van Eycks. See the monograph by Wauters (1856).

Weyman, Stanley John, born at Ludlow, 7th August 1855, was educated at Shrewsbury and Christ Church, Oxford, and became a barrister. In 1890 he published *The House of the Wolf*, in 1891 *The Story of Francis Cludde*, and made himself famous in 1893 by *The Gentleman of France*. Later are *Under the Red Robe* (1894); *My Lady Rotha* (1894); *Memoirs of a Minister of France* (1895); *The Red Cockade* (1895).

Weymouth, a fashionable watering-place of Dorsetshire, 7½ miles S. of Dorchester, 77 S. of Bristol, and 145 WSW. of London (128 by road). It lies at the mouth of the little Wey, on a beautiful bay, bounded E. by St Albans Head and W. by the 'Isle' of Portland (q.v.), and here divided by the projecting Nothe into Weymouth Bay and Portland Roads. The Wey, after widening into the tidal 'Backwater,' enters the sea, and separates the two quarters of the town—old Weymouth proper on the south, and modern Melcombe-Regis, facing the bay, on the north. Both were separate boroughs till 1571, and they still returned two members apiece till 1832, then two conjointly till 1885. A bridge, reconstructed in 1881, connects them; and Melcombe-Regis, which rose into repute through George III.'s frequent visits from 1789, has capital sands, an esplanade over a mile long, statues of King George (1809) and Sir H. Edwards (1885), numerous hotels, and a pile pier 1050 feet long, constructed in 1859 at a cost of £12,000. The Nothe has been strongly fortified since the Crimean war. There is some shipping, steamers running between here and the Channel Islands, and an export trade in Portland stone and Roman cement. Thomas Love Peacock was born here, and here Southey first saw the sea. Pop. (1821) 6622; (1851) 9458; (1891) 13,769. See works by G. A. Ellis (1829) and Robert Damon (1860).

Weymouth, a township of Massachusetts, on Massachusetts Bay, 12 miles by rail SSE. of Boston, containing the four post-villages of Weymouth, and East, North, and South Weymouth, with large factories of nails, boots and shoes, &c. Pop. 10,866.

Whale. The name may be taken as equivalent to Cetacean, and applied to any member of that order of mammals, which includes two great sets: the toothed whales, such as Sperm-whale and Dolphin, and the whalebone whales, such as Right Whale and Rorqual, in which the teeth are only embryonic. The general characters of the order are summed up in the article Cetacea (q.v.). The order Cetacea is usually divided into three suborders: (1) the Mystacoceti or Balænoidea, baleen or whalebone whales; (2) the Odontoceti or Delphinoidea, toothed whales; and (3) the Archæoceti or extinct Zeuglodonts. The differences between the extant sub-orders are so great that any idea of close relationship must be abandoned; their common ancestry must be far back, and indeed it is doubtful whether our classification might not be brought nearer the truth by recognising two distinct orders. Less specialised than the modern types are the extinct Zeuglodonts of the Eocene period, but it is by no means certain that they should be included within the order Cetacea.

Baleen Whales.—Baleen consists of a double series of 300 to 400 horny plates, which grow from the palate and hang down into the mouth. Each plate is somewhat triangular, the base being rooted in the palate; both apex and inner edge are frayed into hairy shreds. These plates grow from parallel ridges on the palate, which are covered with long vascular papillæ. These papillæ become horny

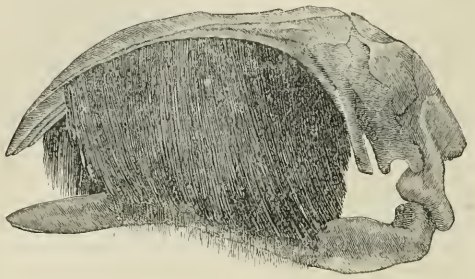


Fig. 1.—Skull of Arctic Right Whale, showing baleen plates in position.

and fuse together to form the plates. The whale is wont to swim with open mouth through shoals of pelagic animals; having secured a good mouthful, it closes its jaws, raises its tongue, allows the water to strain out at the sides through the baleen plates, on the edges of which the food is caught. Thence it is swallowed. In short, the apparatus serves as a strainer or sieve.

There are five extant genera of baleen whales, of which the best known are the Right Whales (Balæna) and the Rorquals (Balænoptera). In the genus Balæna the skin of the throat is smooth, there is no dorsal fin, the neck vertebræ are fused, the fore-limb is short, broad, and five-fingered, the head is very large, the baleen plates are very long, narrow, and black. The Greenland or Arctic Right Whale, or Bowhead (*Balæna mysticetus*), of circumpolar distribution, measures 45 to 50 feet in length, the head forming more than one-third of the whole. It surpasses every other species both in quantity of oil and in length, quantity, and quality of whalebone, a large example yielding 275 barrels of the former, and $1\frac{3}{4}$ ton of the latter. The blubber may be 16 inches in thickness. The huge animal

Fig. 2.—Arctic Right Whale.

feeds for the most part on very minute crustaceans. The Southern Right Whale (*B. australis*) inhabits the temperate seas of both hemispheres, apparently with local varieties in different regions. In many ways it resembles the Arctic species, but has a relatively shorter head, shorter baleen, and a different body contour. The 'Humpback' (*Megaptera boops*) is about the same size as the Arctic right whale, but has the skin of the throat plaited, a low hump-like dorsal fin, free neck vertebræ, very long and narrow four-fingered pectoral limbs, a head of moderate size, short and broad baleen plates. It is common in the North Atlantic between Norway and Greenland, and occasionally visits British coasts. Other forms, perhaps of the same species, occur in the South Atlantic and in the Pacific. For Balænoptera, see RORQUAL. The two other extant genera of Balænoidea are represented by the rare *Neobalæna marginata* from Australian seas, the smallest of whalebone whales, not exceeding 20 feet in length; and *Rhachianectes glaucus*, the Gray Whale of the North Pacific, from 35 to 40 feet long.

Toothed Whales.—The Odontoceti are represented by many more forms than the Mystacoceti, and there is a much greater diversity of type. The Cachalot, or Sperm Whale (*Physeter macrocephalus*), the only representative of its genus, is a huge Cetacean widely distributed in 'schools' in tropical and subtropical seas. 'The length of the full-grown male is from 55 to 60 feet, but the female is stated not to reach more than half that size.' The lower jaw bears on each side twenty to twenty-five strong, conical, recurved teeth, fixed in a long groove and not in distinct sockets; the shape of the skull is very unlike the shape of the head, for while there is a very long rostrum and a deep

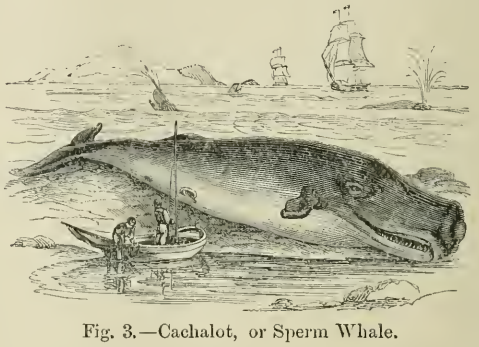

Fig. 3.—Cachalot, or Sperm Whale.

basin-like concavity on the upper surface of the skull, the head is rounded and truncated in front; the bulk of the head above the cranium consists of tough fat or 'junk,' but above this there is a large 'case' containing fluid oil and a granulated substance which yields 'spermaceti;' there is a very long mandibular symphysis; the head is about a third of the total length; the somewhat sigmoid blow-hole is at the anterior end of the head, slightly to the left side; the mouth is ventral behind the end of the snout, the lower jaw may be let down almost at right angles to the upper, and the gape is thus enormously wide; the throat, unlike that of the baleen whales, is also wide, sufficient it is said to admit a man's body; the pectoral limbs are short and broad; the dorsal fin is represented only by a low protuberance. The sperm whale feeds chiefly on cephalopods. The 'schools' may consist of hundreds, led by two or three large bulls; the females often endanger their own safety in aiding their offspring to escape; the bulls sometimes fight desperately with one another, or with their persecutors, and are said to sink not only boats, but even whaling vessels. Apart from oil and spermaceti, the cachalots yield 'ambergris,' an intestinal concretion of strong odour, formerly used in medicine, now restricted to perfumery. The Cachalot is not frequent on European coasts, but is said to have occurred in the Mediterranean, and has been occasionally stranded on British shores.

Within the same family as the sperm whale is the imperfectly known *Cogia breviceps*, a small whale about 10 feet in length, met with at various distant localities in the Southern Ocean, and also off the coast of Madras, and in the North Pacific; the 'Bottlenose' (*Hyperoödon rostratus*), regularly hunted in the North Atlantic, besides several other forms. Very remarkable are the fluviatile and estuarine Platanistidæ, the blind Platanista of the Ganges, Brahmaputra, and Indus, Inia in the Amazon, and Pontoporia in the estuary of the Rio de la Plata. The Delphinidæ are represented by numerous forms—e.g. the Arctic Narwhal (*Monodon monoceros*), remarkable for the enormous single tusk of the male; the Beluga (*Delphinapterus leucas*), a pure white Arctic whale occasionally coming as far south as Scotland and the St Lawrence; the Common Porpoise (*Phocæna communis*); the killer or 'Grampus' (*Orca gladiator*); the Caaing Whale (*Globicephalus melas*); the Common Dolphin (*Delphinus delphis*); and many others.

Whale 'Fishery,' as it is popularly called, seems to have originated in ancient times and independently in many parts of the world. Indians, Eskimos, Japanese, Tartars, and Norsemen were among the early whale-hunters. When the Atlantic right whale was still common, its pursuit was a recognised occupation of the seafaring folk of the Biscayan and Basque provinces, from the 10th to the 16th centuries. As whales became scarce in southern seas, the fishery moved northwards, and squabbles arose among the nations as to the various 'grounds,' which are now regarded as unrestrictedly international. The Dutch founded the settlement of Smeerenberg, in Spitzbergen, as a provisioning centre for the whalers and a melting-place for the whales; but by-and-by this was abandoned, for the whales were driven off and the fishery shifted to Greenland, whence the blubber was sent direct to Holland. In 1680 the Dutch had 266 ships and 14,000 sailors engaged in whaling, and for many years it was from Holland that the chief oil-supply of Europe was drawn. Soon, however, a decline set in, and towards the end of the 18th century the Dutch fishery had almost ceased. From 1732 to 1824 the British whalers were stimulated and subsidised by a government bounty of so much per ton, yet in 1815, when the British whale-fishery was in its most flourishing condition, only 164 ships were engaged in it. By 1828 the number had, however, fallen to 89 vessels, 49 of which were fitted out at Scottish ports. In that season 1197 whales were captured, the result being 13,966 tuns of oil and 802 tons of whalebone. At present Dundee and Peterhead are the chief centres of the British whaling industry, but the number of vessels employed by the two ports is not more than 30. During the 18th century 'a new competitor had entered the field, and soon distanced all others.' In New York and Delaware, New England, and California whaling became an important industry, and as the whales retreated from persecution they were followed as far as Newfoundland. 'About 1750 the distant fishery was prosecuted with vessels of as much as 130 tons. New Bedford, destined to become the metropolis of the American whale-fishery, entered upon the business about 1755. In 1765 Boston had a hundred small vessels.' Towards the last quarter of the 18th century the whalers became more adventurous, and voyaged to the Brazil Banks, Cape Verde Islands, West Indies, &c., but further progress was stopped by the revolutionary war, and many American whalemen sought fortune in Europe. 'The first whale-ship that ventured into the Pacific was sent from England in 1787, and was manned by Nantucket men.' Subsequently the coasts of Chili and Peru and of East Africa were visited. In 1839 the American whale-fishery, having recovered from its temporary decline, boasted a fleet of 557 vessels. In 1846 the whaling-fleet consisted of 678 ships and barques, 35 brigs, and 22 schooners, but soon after this date the fishery began to decline.' (See Mr W. N. Lockington in the *Standard* or *Riverside Natural History*.)

Nowadays a whaler is a ship of 300 to 500 tons, with four or more five-oar boats, with an entire company of not less than thirty-five souls. There are hundreds of specialised appointments—e.g. windlasses for raising the blubber, boilers for 'trying' or melting the blubber, tanks for storing the oil. The crew are usually shipped on a profit-sharing system. A whale-boat is 28 to 30 feet by 6, sharp at both ends, and with sloping sides. It is manned by 'boat-header,' boat-steerer, and four men. It carries a long line coiled in one or two tubs, and arranged to run in a convenient manner when the harpoon to whose end it is fixed has struck a whale. And besides the essentials—harpoon and line—there are numerous accoutrements—e.g. lances, bomb-gun, and harpoon-gun. From a distance of about 3 fathoms the boat-steerer throws his harpoon, or more than one; if it strikes, the oarsmen back water vigorously to escape the not unfrequent blow of the whale's flukes. If the whale is fast, its behaviour regulates the working of the boat; but whether the victim 'runs,' or 'sounds,' or 'brings to,' the whalemen do their utmost to get as soon as possible within range of lance or gun.

Economic.—As is well known, whales are chiefly valuable on account of the oil yielded by the blubber and the whalebone or baleen. Spermaceti and ambergris have a subsidiary economic importance. As to the oil, which was formerly the most remunerative result of whaling, it must be remembered that the use of gas and other modern illuminants has reduced the necessity of having oil-lamps, and that mineral and vegetable oils are now used for many purposes—e.g. 'batching' jute, for which whale-oil was once in great request. Still, however, the oil finds a ready sale, the sperm-oil of Physeter having a distinct precedence over the train-oil of the baleen whales. For whalebone, spermaceti, ambergris, see separate articles.

It must be admitted that although great prizes are sometimes won by the whalers, the fishery is somewhat of a lottery. Apart from the dangers of shipwreck, exposure, and starvation, now happily diminished, the vessel may come home 'clean,' or without a single fish. It is recorded that a Peterhead whaler once captured in one season forty-four whales, and returned with a cargo of oil and whalebone valued at over £10,000; and that the *Arctic* of Dundee, under Captain Adams, once brought home the produce of thirty-seven whales, including about 18 tons of baleen. Even in those days this was exceptional; now very poor 'fishings' are more usual, and Dundee ships have, without much success, tried the Antarctic. On the other hand, the scarcity has raised prices, and a really successful trip yields large returns. The *Arctic* came home to Dundee in 1895 with the produce of ten whales, including 5 tons of bone (some of which sold at £2000 per ton) and 90 tuns of oil—the total return being 360 per cent. on the outlays. It may be doubted whether the results of the fishery justify the persecution of the unfortunate whales.

Hist.*, 1891).

WHALEBONE consists of the baleen plates of the Arctic and allied whales. They are, however, not bone at all in the ordinary sense of the word, but consist of an epidermic substance more resembling hair in its nature. The baleen, which occurs in triangular plates, only requires to be scraped and softened, by boiling it for ten or twelve hours, to bring it into a proper condition for use. It is then cut into strips of various sizes for the market. For some purposes whalebone excels in usefulness any other known substance, as it has great flexibility combined with lightness and strength; but its toughness, the ease with which it can be split, and its power to stand without change a heat considerably above ordinary temperatures add to its value. The high price which whalebone has reached precludes the possibility of its being used so extensively as it was in former years. It is still made into brushes for street-sweeping machines, for cleaning flues, and for other purposes in which they are subjected to much tear and wear. Dressmakers and milliners also employ it to a limited extent. Steel wires, as they take up less room, took the place of whalebone for umbrella frames about the middle of the 19th century. The earlier whalebone umbrella-stretchers were as much like spokes of wheels as wires. For other purposes steel, vulcanite, and cane are substitutes for whalebone, but in some cases only indifferent substitutes. The lowest price of whalebone during the 18th century was £350 per ton, but early in the 19th it had fallen to £25, and even as late as 1868 did not fetch more than £40. In 1882 it had advanced to £1150, and in August 1892 it had reached the very high figure of £2925 per ton. This, however, is for dry whalebone a year old. New whalebone, which is not so free of moisture, is worth about £2500 per ton. Nowadays an average sized Arctic whale yields about 10 cwt. of whalebone, but in former years 1½ ton was occasionally obtained from a single 'fish.'

Whale-louse.

Whale-louse (*Cyamus*), a genus of Crustacea, of the order Amphipoda and sub-order Læmodipoda, parasitic on the skin of Cetaceans. The body is broad and flat, the abdomen is rudimentary, the appendages are short, stout, and for the most part clawed. By means of these claws they attach themselves to whales, sometimes almost covering the skin, so that the animal appears whitish. See PARASITIC ANIMALS.

Whalley, EDWARD, regicide. See GOFFE.

Wharfe, a river of the West Riding of Yorkshire, flowing 80 miles ESE. past Ilkley, Otley, and Tadcaster, to the Ouse near Selby.

Wharncliffe, LORD (1776-1845). James Archibald Stuart Wortley Mackenzie was educated at Eton, served in the army, and entered the House of Commons in 1797. As a Tory he opposed Catholic emancipation, but was one of the 'waverers' who helped to pass the Reform Bill, having been created a baron in 1826; he opposed Peel's Free Trade till his death. His name is remembered in connection with 'Wharncliffe Meetings'—meetings of public companies under a standing order of the House of Lords introduced by him. Under this 'Wharncliffe Order' proceedings for the modification of the powers of a company constituted by act of parliament cannot be instituted in the House of Lords till it is reported that a special meeting of the proprietors has been called under specified conditions of publicity.

Wharton, GRACE, the pen-name of Mrs Katherine Thomson (*née* Byerley; died 1862), authoress of Lives of Raleigh (1830), Sarah, Duchess of Marlborough (1838), and the Duke of Buckingham (3 vols. 1860), *Memoirs of the Jacobites* (3 vols. 1845-46), &c. With Philip Wharton, pen-name of her son, John Cockburn Thomson (died 1860), she published *Queens of Society* (2 vols. 1860) and *Wits and Beaux of Society* (2 vols. 1860).

Wharton, PHILIP WHARTON, DUKE OF, was the son of Thomas Wharton (1640-1714), who in 1706 was created Earl, and in 1714 Marquis, of Wharton—an eminent Whig statesman, the reputed author of *Lillibullero* (q.v.), and Lord-lieutenant of Ireland from 1708 until after the fall of the Godolphin administration in 1710. Macaulay says he was licentious and corrupt; but the faults of his Irish administration were largely redeemed by his appointment of Addison as Chief-secretary. Philip, born in December 1698, was educated at home by his father, who aimed at making him a great orator, a Whig in politics, and a Presbyterian in religion. In a boyish freak he contracted a Fleet marriage with the daughter of a Major-general Holmes. The shock is said to have killed both his parents. Wharton soon parted from his wife, and in 1716 went abroad with a French Huguenot tutor, to be brought up at Geneva. He contracted debts, spurned the restraints of his tutor, and running away to Avignon accepted, it is said, from the Old Pretender the title of Duke of Northumberland. He next visited Paris, and after various extravagances set out for Ireland, where, minor though he still was, he was allowed to take his seat in the House of Peers. He soon displayed such splendid abilities in debate, and supported the government with so much zeal, that he was, January 20, 1718, raised to the highest rank in the English peerage. He did not take his seat in the English House of Peers until 1720. Here he opposed with much warmth the government measure on the South Sea Bill, and the bill of pains and penalties against Bishop Atterbury. His affairs became hopelessly involved by his extravagance, so that, although he had succeeded to an estate of £16,000 a year, he was soon compelled to accept a yearly allowance of £1200 from his creditors. He set up a political paper, called the *True Briton* (74 numbers, 1723-24), and lost no occasion of speaking, as well as writing, against the ministry and the court. In 1724 he set out for Vienna, and then visited Madrid, where he was served with an order from the Privy Seal to return home. He treated the order with contempt, and afterwards went to Rome, and appeared openly at the court of the Pretender, from whom he accepted the Order of the

Garter. He now assumed the title of Duke of Northumberland. In 1727 he fought with the Spaniards and against his countrymen at the siege of Gibraltar. This last mad act lost him his English title and estates, and led to his conviction under a bill of indictment for high-treason. He refused to make his submission to the government; and the rest of his life was passed in France and Spain, at one moment squandering his precarious supplies of money in drunkenness and luxury, and at another suffering the extremest poverty. He died in a miserable condition at a Bernardine convent in Catalonia, May 31, 1731. His brilliant talents and wasted life were sketched by Pope in his Moral Essays, in the lines beginning, 'Wharton, the scorn and wonder of our days.'

See the *Life and Writings of Philip, late Duke of Wharton* (2 vols. 1732), and *The Poetical Works of Philip, late Duke of Wharton, and of the Duke's Intimate Acquaintance* (2 vols. 1727); and the *Life* of him by J. R. Robinson (1896).

Whately, RICHARD, Archbishop of Dublin, was born in London, 1st February 1787, the fourth son of Dr Joseph Whately of Nonsuch Park, Surrey, prebendary of Bristol, vicar of Widford, and lecturer at Gresham College. He was sent in due time to a private school at Bristol, whence in 1805 he passed to Oriel College, Oxford. He took a double second-class in 1808, gained the prize for the English essay in 1810, and the year after was elected a fellow of Oriel College. Copleston, Davison, Arnold, Keble, and Hawkins were already fellows, and Newman and Pusey were added later. In his *Apologia* Newman tells us that Whately opened his mind and taught him how to think and reason. In 1815 he became one of the college tutors, and about this time he wrote for the *Encyclopædia Metropolitana* what he afterwards expanded into his popular treatises on Logic (1826) and Rhetoric (1828). He had married in 1821, and accepted the living of Halesworth in Suffolk, and he had already given the world the first proof of his peculiar wit in *Historic Doubts relative to Napoleon Bonaparte* (1819)—an ingenious attempt to reduce to an absurdity Hume's position that no testimony is sufficient to prove a miracle. In 1822 he delivered the Bampton Lectures at Oxford, on the Use and Abuse of Party Feeling in Religion. In 1825 he was appointed Principal of St Alban's Hall, and in 1829 was appointed professor of Political Economy, but had only given a few lectures when in 1831 he was made Archbishop of Dublin.

A Liberal in religion and in politics, Whately may be counted one of the founders of the Broad Church party. Broadly rational in temper, sober and impartial, he was a resolute opponent of the Tractarian movement, but to the Evangelicals he seemed little better than a Latitudinarian, for he supported Catholic emancipation and concurrent endowment, and laboured long, but in vain, to establish a system of unsectarian religious instruction. Still worse, he was more than suspected of holding unsound views on predestination, future punishment, and the Sabbath question, and of being somewhat Sabellian on the nature and attributes of Christ. His caustic wit, abrupt manners, and fearless outspokenness brought him no little unpopularity, but the sterling honesty of his nature, his charity, justice, and sagacity gained him many friendships of unusual permanence and warmth, and conquered for him the respect of all men. One of the deepest things in his nature was a strong sense of duty, but for which indeed he would never have accepted the archbishopric, for he was within the truth when he termed the appointment 'a call to the helm of a crazy ship in a storm.' He died 8th October 1863.

Whately, though a strong logician, was devoid of the speculative faculty, hence his theological writings lack that kind of value which is the most enduring. But his acute intellect enlightened every subject that he touched, and his powers of exposition and illustration have hardly ever been surpassed. Of his books may be named *Essays on some of the Peculiarities of the Christian Religion* (1825), *Essays on some of the Difficulties in the Writings of St Paul* (1828), *Thoughts on the Sabbath* (1830), *Christian Evidences* (1837), *Essays on some of the Dangers to Christian Faith* (1839), *The Kingdom of Christ Delineated* (1841), and his edition of Bacon's Essays, with annotations not unworthy of the text (1856), as well as Paley's *Evidences* and *Moral Philosophy*. A list of his writings is appended to the New York edition of his *General View of Christianity* (1860). See the rambling *Memoirs* by W. J. Fitzpatrick (2 vols. 1864), and the more authoritative *Life and Correspondence* by Miss E. Jane Whately (2 vols. 1866).

Wheat, the most valuable of all the cereal grasses. The genus Triticum, of which the species are popularly known either as *Wheat* or *Wheat-grass*, is distinguished by a spike with many-flowered spikelets, without stalks, and seated one on each notch of the rachis, their sides directed to the rachis, which is zigzag; and two glumes, of which the lower is either awned or awnless; the outer palea of each floret having at the top a notch, in the centre of which is the terminal point, sometimes prolonged into an awn, or, in some species, with many florets tapering into an awn without a notch. (See the diagrams of a wheat spikelet and a wheat grain at GRASSES.) A number of species are found in Britain, of which *T. repens*, well known as Couch Grass (q.v.), is the most common; but the seeds of none of them are of any value. The native country of the cultivated wheat has generally been supposed to be the central part of Asia; it has been reported to have been seen growing wild in Mesopotamia, Kurdistan, and elsewhere, but the fact has not been proved. M. Fabre asserted, after a series of experiments in 1838–46, that the *Ægilops ovata*, a grass of the regions near the Mediterranean and of the west of Asia, had under his superintendence been transformed into wheat; but it is suspected that his grasses were hybridised by wheat. It is commonly believed, however, that the cultivated varieties of wheat are derived from some of the species of the genus Ægilops.

Wheat has been cultivated from the earliest ages, seems to have been cultivated in China 3000 years B.C., is found in prehistoric European lake-dwellings, and was a chief crop in ancient Egypt and Palestine, as it still is in all the temperate parts of Europe, Asia, and Africa. It is cultivated to a considerable extent in the north of India. In North America it is very extensively cultivated, and many parts of the United States and British provinces are admirably adapted to it. Wide regions of South America are equally suitable, and wheat of the finest quality is produced in Australia. In the torrid zone wheat does not succeed, except in elevated situations; but it nowhere succeeds better than in subtropical regions, although it is a hardy plant, and when covered by snow endures even very severe winters in the north of Europe. For its successful cultivation, however, it requires a mean temperature of at least 55° F. for three or four months of the year. It is an annual plant, and its capacity of enduring the cold of winter is of importance only in connection with the advantage to be derived from sowing in autumn, so as to have it more forward in spring. Its cultivation does not extend so far north as that of barley or oats, or even of rye. In Europe its northern limit is about 60° lat. The quality of the grain varies much in different soils and climates, and particular varieties are also

distinguished by difference of quality as well as by external characters. The wheat of the eastern parts of Britain, where the climate is comparatively dry, is superior to that of the western parts, where the sky is more cloudy and the climate more humid, although the crops in the west are not less luxuriant.

Common Wheat (*T. vulgare*, or *sativum*) grows to a height generally of 3 or 4 feet, and has ears or spikes generally 3 or 4 inches long; the spike 4-cornered, the spikelets about 4-flowered; the paleæ ventricose, ovate, truncate, mucronate or awned, compressed under the point, rounded at the back, the grain free. In consequence of long cultivation, in a great variety of climates, the cultivated varieties of wheat are very numerous. New varieties are continually coming into notice; and many are in high estimation in particular districts, although little known beyond them. Some botanists have attempted to distinguish species among them, appropriating the name *T. æstivum* to the awnless kinds, and *T. hybernum* to the awned; but intermediate forms are very numerous, and the length or shortness of the awn seems to depend upon accidental circumstances. Nor do the awnless or beardless kinds perfectly correspond with the Summer Wheat of farmers, preferred for sowing in spring with a view to a crop in the same season, and the awned or bearded kinds to the Winter Wheat, sown in autumn; as some of the hardy varieties of Winter Wheat are awnless, and some of those usually sown in spring are bearded. Besides being classified as Bearded and Beardless, the varieties in cultivation are also distinguished, according to the colour of the grain, as *White* and *Red* wheats. Some having the ears covered with a short soft down are known as *Woolly* wheats. There are also differences in the length and compactness of the spike, and in the size and form of the grain, which is more rounded in some, and more elongated in others. A number of varieties having the spike very compact or square have been sometimes classed together under the name of *T. compactum*, and the distinction is very obvious and permanent, although there is no reason for regarding it as characterising a distinct species. Akin to this is the Mummy Wheat (*T. compositum*), in which the spike is branched, and which used to be described on totally insufficient evidence as having been produced from seeds found in mummy-cases in Egypt. Mummy wheat has been grown in England of which the ears have had 10 or 11 branches, and 150 grains have been found in one ear; whilst 60 ears have been produced by a single seed. Notwithstanding these apparent advantages, however, this variety does not serve the purposes of the farmer so well as some others. In another group of varieties with compact ears (*T. turgidum* of some botanists) the glumes are remarkably tumid, and always awned. Polish Wheat (*T. polonicum*) is a well-marked, coarse type. Spelt (*T. spelta*) is probably only a race of *T. sativum;* it was cultivated by the Swiss lake-dwellers and the ancient Romans, and is still grown in the mountainous parts of Europe and elsewhere.

The red varieties of wheat are generally more hardy than the white; the grain is inferior in quality, and yields less flour, but these disadvantages are more than counterbalanced in many soils and situations by the greater productiveness of the crop. Red wheats are therefore preferred for comparatively poor soils, but the white kinds are generally cultivated wherever the soil and climate are suitable. The varieties with long straw yield the best crops in dry seasons, but the short-strawed kinds are best when the season is wet. Wheat is particularly suited to clay soils and rich heavy loams; but with good farming excellent crops are produced even on light sandy or gravelly and on chalky soils. Where the climate is moist a light dry soil is most suitable; soft deep soils being productive chiefly of straw. The land intended for wheat must, at least in Britain, be in a high state of cultivation and fertility. Wheat is commonly sown after green crops, beans, or bare fallow, and often after grass or clover. It may be sown, at least in autumn or the beginning of winter, when the ground is so saturated with moisture that any other kind of grain would be almost sure to perish. It is either sown broadcast or in drills, and the practice of drilling becomes more and more prevalent, on account both of the saving of seed and of the superiority of the crops produced. The land prepared for wheat is very often manured with farmyard manure or artificial manures.

The relative proportions of straw and grain differ very much in different varieties of wheat, and according to differences of soil, climate, and season. The proportion of the weight of grain to that of the whole plant when dried so as to be ready for stacking varies from 20 to 47 per cent. The composition of the grain itself varies considerably as to the proportions of starch, gluten, &c. which it contains. American wheats are drier than European wheats in the proportion of 10·27 to 14 per cent. of moisture; the carbo-hydrates (starch, &c.) average 72 per cent. instead of 68 per cent., as in English wheat. American wheat has a small grain, very free from fibre (bran), very rich in carbo-hydrates and oil, but deficient in albuminoids —not necessarily the best indication of value. European wheat has usually 13 per cent. of albuminoids (gluten, &c.), and sometimes 19·5 per cent. American wheats have an average of 11·95 per cent., and those from the Pacific coast only 8·6 per cent. Australian and Egyptian wheats, both remarkably fine, are also somewhat deficient in albuminoids. 100 parts of the grain of European wheat, dried in the ordinary manner, have yielded water, 14·83; gluten, 19·64; albumen, 0·95; starch, 45·99; gum, 1·52; sugar, 1·50; oil, 0·87; vegetable fibre, 12·34; ash, 2·36—total, 100·00. Wheat ash is rich in phosphoric acid, magnesia, and potash.

The value of wheat depends mainly on the quantity of fine flour which it yields; the best wheat yielding 76–80 per cent., sometimes even 86 per cent. of fine flour, whereas inferior kinds seldom yield more than 68 per cent., and sometimes only 54–56 per cent. In general the smoother and thinner the grain is in skin the greater is the produce of fine flour. The greater part of the husk of wheat is separated from the flour by the miller, and is known as *bran*. That portion of the bran which is more finely divided than the rest receives the name of *sharps* or *pollard*. See the articles BRAN, FOOD, BREAD.

Wheat being the most esteemed of all the cereals, particularly for the making of bread, the increase of its cultivation and use has marked the progress of agriculture and of wealth in many countries. It is only in comparatively recent times that bread made of wheat has become a common article of food among the labouring classes in Britain. In the 8th century the monks of the abbey of Bury St Edmunds ate barley-bread, because the income of the abbey would not admit of their using wheaten bread regularly. At a later period wheat was largely used, at least in the southern parts of England, for a short time after harvest, but the supply was soon exhausted, and recourse was again had to inferior kinds of food. From Walter of Henley's *Husbandry* (ed. by Eliz. Lamond, 1892) we learn that in the early 13th century wheat was expected to produce only five-

fold (as compared with say fourteen-fold now). Down to the end of the 17th century wheaten bread was a principal article of food only among the more wealthy; and the servants in their houses were still furnished with oats, barley, and rye. In the northern parts of England, as well as in Scotland, the use of wheaten bread was comparatively rare even at the middle of the 18th century. 'So small was the quantity of wheat used in the county of Cumberland,' says Eden, in his *History of the Poor* (1797), 'that it was only a rich family that used a peck of wheat in the course of the year, and that was at Christmas. The usual treat for a stranger was a thick oat-cake (called *haver-bannock*) and butter. An old labourer of eighty-five remarks that when he was a boy he was at Carlisle market with his father, and wishing to indulge himself with a penny loaf made of wheat-flour, he searched for it for some time, but could not procure a piece of wheaten bread at any shop in the town.' At the period of the Revolution, 1689, the quantity of wheat grown in England was estimated at about 14,000,000 bushels, or about three bushels to each of the population, which was then under five millions. In 1828 about 100,000,000 bushels were produced, or about seven bushels to each of the population, then under fifteen millions. Between 1799 and 1800 the price of wheat in England rose from 69s. per quarter to 113s.; in 1801 it was 119s.; and next year sank to 69s., rising again to 106s. in 1810, and 126s. in 1812. Since 1817 (when it was 86s.) it has greatly fallen; the average price for the first time touching as low a point as 30s. in 1886, and 28s. in 1892. For the varying price and the controversies therewith connected, see CORN LAWS.

In 1891 there were 2,192,393 acres under wheat in England, 61,590 acres in Wales, 53,294 acres in Scotland, and 80,870 acres in Ireland. The estimated produce of this, in bushels of 60 lb. each, was as follows: England, 68,694,456 bushels; Wales, 1,461,740 bushels; Scotland, 1,971,067 bushels; and Ireland, 2,615,437 bushels—giving a total of 74,742,700 bushels, of 60 lb. each, for the United Kingdom. To supplement the home production of wheat no less than 123,784,192 bushels of wheat, besides flour equal to other 41,830,008 bushels, were imported into the United Kingdom in 1891. The total imports of wheat for 1891 were thus equal to 165,614,200 bushels, giving a wheat supply for that year of 240,356,900 bushels, or a little over 6 bushels per head of the population. It will be observed that the quantity of wheat now imported into the United Kingdom is more than double that produced at home. Year by year the imports increase and the home production declines. Meanwhile the price fell from an average of 58s. 8d. per quarter in 1873 to 22s. 10d. per quarter in 1894; in 1897 it rose to 30s. 2d., and in 1898 rose suddenly to 36s., and even during the Cuban war to 56s. As the result of the fall in price the area under wheat in the United Kingdom decreased by more than half between 1874 and 1895; but from 1,417,641 acres in 1895 it increased again to 2,102,220 acres in 1898. In 1895 the wheat imported comprised 67,615,785 cwt. from foreign countries and 14,134,170 from Greater Britain. In 1897 there came from Greater Britain 5,393,360 cwt., and from foreign countries 57,346,820 cwt.; besides 18,680,669 cwt. of wheaten flour. In 1898 the quantities were 50,466,780 cwt. of wheat from foreign countries and 14,761,550 cwt. from our own possessions, besides 21,071,109 cwt. of wheaten flour. Almost all the flour comes from the United States on the one hand and Canada on the other. The unground wheat comes mainly from the United States and Russia, India and Canada being the next most important sources of supply. The United States and Russia seem likely to maintain the lead. There has lately been much discussion as to the probable future of wheat cultivation in the United Kingdom. With prices averaging 30s. to 35s. per quarter—nearly 20s. per quarter less than prior to 1879—wheat cannot now be grown at a profit in many parts where it was formerly cultivated with success. Indeed, wheat cultivation is being persevered with only in soils and situations specially favourable to it. Through the superior systems of farming pursued the produce of wheat per acre in the United Kingdom is greater than in any other country, but the cost of production is necessarily much higher than on the rich virgin soils of comparatively new countries.

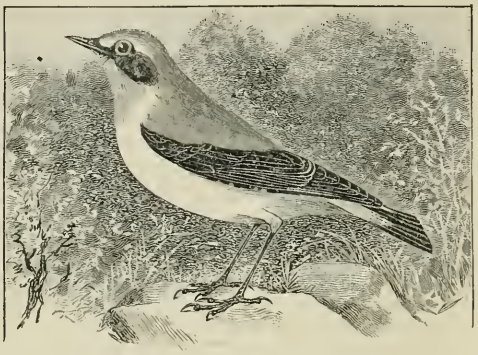
The Spaniards introduced wheat-culture into Mexico about 1530; wheat was first planted in New England in 1602, and in Virginia in 1611. The growth of the acreage in the United States has been phenomenal, especially since the development of the central states in the upper Mississippi valley, and again on the Pacific coast. In California the crop in 1850 was but 17,200 bushels, whereas in 1898 it was 12,224,403 bushels. In the same year Minnesota produced 78,417,912 bushels; Ohio, 42,103,173; Kansas, 64,939,412; Indiana, 38,426,029; North Dakota, 55,654,445; South Dakota, 42,040,923; followed by Illinois, Iowa, Oregon, Nebraska, Pennsylvania, Missouri, and Michigan. The total wheat crop of the United States was 260,146,900 bushels in 1869–70, since which it has increased (with fluctuations) to 530,149,168 in 1897–98. The total exports of wheat and wheat flour were 319,186,871 in 1897–98, 313,021,235 being retained for domestic consumption. The acreage of the United States in 1898 may be put at about 44,000,000; Russia, 29,000,000; France, 17,200,000; United Kingdom, 2,155,000; Australasia, 5,000,000; and the Argentine Republic in 1899, 7,904,000 acres, yielding about 94,750,000 bushels, and the export in 1898 being about 24,450,000 bushels.

The principal diseases to which wheat is subject, some of which are productive of great loss to the farmer, are either owing to or connected with the presence of parasitic fungi. The chief of these diseases, noticed separately, are Bunt, Mildew, Rust, and Smut. Wheat is also liable to injury from several insect pests, such as Wireworms, and various other Corn Insects (q.v.). The Hessian Fly is separately discussed. *Ear-cockles* (also called 'purples' or 'peppercorn') is a disease in wheat associated with the abundant presence of a Threadworm (q.v.) parasite. This minute animal has received various names—e.g. *Vibrio tritici*, *Anguillula tritici*, but is now usually called *Tylenchus scandens*. An infested or mildewed ear of wheat contains some ten larvæ in each grain; these lie quiescent, and can so remain for many years, surviving what appears to be very thorough desiccation. If the grain be sown the larvæ become active, and migrate into the soil. Thence they return to the young wheat-plants, into which they insinuate themselves, and may there spend the winter. With the growth of the plant the threadworms ascend the stem and finally pass into the ears. There they become sexually mature, and the females deposit eggs. After that the parent forms apparently die, but the eggs develop into larvæ.

See AGRICULTURE, and books there cited; CEREALIA; CULTIVATED PLANTS; GRASSES; STRAW; PLANTS (DISEASES OF); Vilmorin, *Les Blés Meilleurs* (1881); and on Ear-cockles, Davaine, *Recherches sur l'Anguillule du Blé* (1857), and the researches of Ritzema-Bos in the *Biologisches Centralblatt* (1888).

Wheat-ear (*Saxicola œnanthe*), a bird of the Chat genus (q.v.). It is one of the first spring visitors to the British Islands, and although gener-

ally and widely diffused it is still a local bird in most places. In the south and west of England it is somewhat rare; in the north it is commoner; while in the Orkneys and Shetland and the Outer Hebrides it is one of the commonest and most abundant birds. It breeds throughout central and northern Europe, and in southern Europe where the mountains are high enough for pine and birch; westwards to Iceland, Greenland, and Labrador; eastwards to Persia, Syria, North Siberia, and Alaska. Its winter migrations extend southwards to North and West Africa, Mongolia, Northern India, Persia, and the Bermudas and Colorado. It nests about the middle of April, and produces two broods



Wheat-ear (*Saxicola œnanthe*).

of from five to seven young in a season. It feeds on insects, grubs, worms, small spiders, and small snails. It is a good mimic, and the song of the male is rather pretty. The most striking character of the plumage is the white colour of the rump, upper tail-coverts and base of the tail, whence the name *white rump*, by which the bird is known in every European language, and of an Anglo-Saxon equivalent of which 'wheat-ear' is believed to be a modern corruption—though it is thought by some to be for *whitterer*, meaning *twitterer*. The wheat-ear migrates at night, and in autumn when the birds are fat and of rich flavour they used to be snared in great numbers by shepherds, and sent to the London and other markets. Of late years they have become much less plentiful, owing probably to the destruction of their favourite breeding-grounds by cultivation. The wheat-ear is also known by the names fallow-finch, white-tail, stone-chacker, chack-bird, &c. They arrive in Britain in two divisions, the first, in March, consisting of poor, emaciated birds, the second, a month later, of plump ones. The Isabelline Wheat-ear (*S. isabellina*) has been found only once in Britain. It differs from the common wheat-ear in being larger, more tawny, in having a shorter tail with more black in it, and the under wing much lighter. The Black-throated Wheat-ear (*S. stapazina*) and the Desert Wheat-ear (*S. deserti*) have been found in Britain only once or twice.

Wheat-fly. See CORN INSECTS, HESSIAN FLY.

Wheaton, HENRY, American jurist, was born at Providence, Rhode Island, November 27, 1785, graduated at Brown University in 1802, and three years later was admitted to the bar. From 1812 to 1815 he edited the *National Advocate* in New York, then for four years was a justice of the Marine Court there, and from 1816 to 1827 reporter for the United States Supreme Court (*Reports*, 12 vols. 1826–27; also *Digest of Decisions from 1789 to 1820*, 1820–29). In 1827–35 he was *chargé d'affaires* at Copenhagen, and in 1835–46 minister at Berlin. In 1836 he published his most important work, the *Elements of International Law*, which has seen many editions, under various editors, and been several times translated. Other works include a Life of William Pinkney, Histories of the Northmen and of the Law of Nations, &c. He died at Dorchester, Massachusetts, March 11, 1848.

Wheatstone, SIR CHARLES, scientist, electrician, and the pioneer of telegraphy, was born in the vicinity of Gloucester, in February 1802. A precocious child, he could read at four years of age, and at the private school which he afterwards attended he showed a strong liking for mathematics and physics. In 1806 his father, who was a musical instrument maker, removed to London, and began business. In 1816 young Wheatstone was placed with his uncle, a music-seller, but his father removed him when he saw that he was more inclined for study. Endowed with remarkable ingenuity, he produced numerous models and apparatus to illustrate the phenomena of acoustics and light, and also exhibited some clever musical instruments. For a period of six years (1823–29) Wheatstone was back at the music-selling business. A paper of his on *New Experiments in Sound* was translated into French and German, and previous to 1833 he had published five papers connected with this subject. In 1831 he read a paper on *Transmission of Sound through Solids* before the Royal Institution, and henceforward he became known as an earnest and hard-working man of science. Although he could describe and explain his inventions clearly enough, he was shy and sensitive, and failed as a lecturer, many of his investigations being made known by Faraday at the Royal Institution.

In 1834 he was appointed professor of Experimental Philosophy at King's College. He invented a rotating mirror, by means of which he determined the time the electric impulse took to travel along a ¼ mile of copper wire. His future studies were now in the line of sound and electricity. In 1835 he made a speaking-machine with an india-rubber mouth, which uttered such simple words as 'rum,' 'mamma,' &c. Wheatstone and W. F. Cooke in 1837 took out a patent 'for improvements in giving signals and sounding alarums in distant places by means of electric currents transmitted through metallic circuits.' From this instrument, which had five needles, has grown that system of electric telegraphs which now ramifies over the length and breadth of the United Kingdom. Between 1836–40 his mind was also occupied with the problem of submarine telegraphy (see TELEGRAPH).

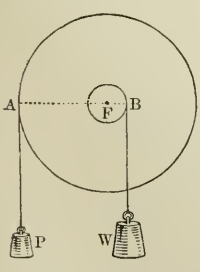
In a paper on Binocular Vision laid before the Royal Society in 1838 he explained the principle of the Stereoscope (q.v.), an instrument of his invention; in 1840 he showed that, by means of electro-magnetism, a number of clocks far apart might be kept going with absolute exactitude from one central clock (see Vol. IV. p. 253); and in 1843 he brought out his new instruments and processes for determining the constants of a voltaic series. Wheatstone was unrivalled in reading secret cipher; and his own cryptograph is said to have never been deciphered. There were also his automatic telegraph in two forms; his telegraph thermometer and barometer; a machine for the conversion of dynamical into electrical force without the use of permanent magnets; and an apparatus for conveying instructions to engineers and steersmen on board large steam-vessels. The method of measuring electrical resistance known as Wheatstone's Bridge (brought into notice, though not invented by him) is explained at ELECTRICITY, Vol. IV. p. 268. Nor should we omit to mention his Concertina (q.v.) and polar clock. He was a vice-president of the Royal Society, and received its royal medal in 1840 and 1843, and the Copley medal in 1868. He was

knighted in 1868, was made LL.D. of Edinburgh in 1869, and died at Paris, October 19, 1875.

Most of Wheatstone's investigations are described in *Philosophical Transactions*, *Proceedings of the Royal Society*, and British Association *Reports*. His *Scientific Papers* (1879) are among the publications of the Physical Society, London. See *Proc. Inst. C. E.* (xlvii.), and *Proc. Roy. Soc.* (xxiv. 47).

Wheel, Breaking on the, a very barbarous mode of inflicting the punishment of death, formerly in use in France and Germany, where the criminal was placed on a wheel, with his arms and legs extended along the spokes, and the wheel being turned round, the executioner fractured his limbs by successive blows with an iron bar, which were repeated till death ensued. There was considerable variety in the mode in which this punishment was inflicted, at different times and in different places. By way of terminating sooner the sufferings of the victim, the executioner was sometimes permitted to deal two or three severe blows on the chest or stomach, known as *coups de grâce;* and occasionally, in France at least, the sentence contained a provision that the criminal was to be strangled after the first or second blow. Mercy of this kind was, however, not always allowed to be shown to the victims of the wheel: when Patkul, the envoy of Peter the Great, was put to death on the wheel by order of Charles XII. of Sweden, it is said that the officer in command of the guard was cashiered by the Swedish king in consequence of having allowed the head to be struck off before life was extinct in the mangled limbs. The punishment of the wheel was abolished in France at the Revolution—Jean Calas (q.v.) had suffered by this means; in Germany it was inflicted within the 19th century on persons convicted of treason and parricide. The murderer at the wife's instigation of John Kincaid of Warriston was broken on the *row* or wheel at Edinburgh in 1604, as also two of the slayers of the Regent Lennox.

Wheel and Axle is a modification of the Lever (q.v.). Its most primitive form is a cylindrical axle, on which a wheel, concentric with the axle, is firmly fastened. When employed for raising heavy weights, the weight is attached to a rope which is wound round the axle, and the power is applied either to a rope wound round the grooved rim of the wheel, or to a handle fixed at right angles to the wheel's rim, or to its practical equivalent, an ordinary winch. The accompanying figure exhibits a transverse section of one of the commoner forms, and shows that the machine is neither more nor less than a lever, whose extremities are the points at which the power and weight act. These do not act at *invariable* points in the circumferences of the circles whose radii are FA and FB. They act along the cords wound round the circles and therefore at the points A and B at which *for the moment* the cords are tangents to the circles. Thus the imaginary simple lever, AB, is preserved unaltered in position and magnitude. The conditions of equilibrium are that P × AF = W × FB, or, since the circumferences of circles are proportional to their radii, that P : W :: circumference of axle : circumference of wheel. The *capstan* and *windlass* are simple and common examples of this mechanical power, and combinations of toothed-wheels, or of wheels from one to another of which motion is communicated by an endless band, are compound illustrations of the same.—For wheels and wheel work generally, see works on mechanical engineering, like Rankine's *Applied Mechanics*. There are treatises on toothed wheels by Camus (1806; new ed. 1868) and Robinson (1876). For water-wheels, see Water (section on Water-power); for the potter's wheel, see Pottery.

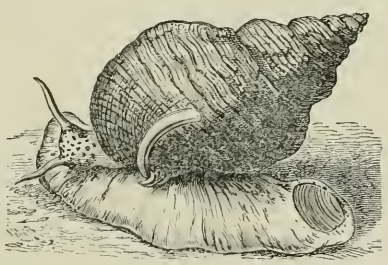


Wheel-animalcule. See Rotatoria.

Wheeling, the principal city of West Virginia, a port of entry, and capital of Ohio county, on the left bank of the Ohio River, and at the mouth of Wheeling Creek, at the foot of steep hills, 67 miles by rail and 92 by river SW. of Pittsburgh. The National Road here crosses the Ohio, over which is a wire suspension bridge, with a span of 1010 feet; and a fine railway bridge connects the city with Bellaire, Ohio. For ten years (1875–85) Wheeling was the state capital. It contains a fine court-house, a custom-house, and a female college. The hills around the city are full of bituminous coal. The principal manufactories are blast-furnaces, foundries and forges, nail-factories, glass-works, woollen, flour, and paper mills, &c. Pop. (1880) 30,737; (1890) 35,013.

Wheel-lock. See Firearms, Vol. IV. p. 638.

Whelk, a popular name for a number of marine Gasteropods, and especially applied to species of Buccinum common on the coasts of northern seas. Very familiar is *Buccinum undatum*, the 'common whelk,' often dredged for bait or as food for the poor. It occurs from low-water to a depth of about 140 fathoms, and burrows in the sand for bivalves, such as Mya, on which it feeds. Its shell is sometimes 3 inches in length, is grayish or brownish-white in colour, and has a few ridged whorls, a wide aperture, and a short notch or canal for the respiratory siphon. The animal has a strong radula with which it can bore through shells, a markedly protrusible mouth, a long protrusible siphon through which water enters the gill-chamber, and a plate-like horny operculum borne by the foot.



Common Whelk (*Buccinum undatum*).

The notch at the mouth of the shell, in which the siphon lies, is characteristic of most carnivorous Gasteropods. The egg-capsules, which are aggregated in balls, are often seen attached to the rocks or drifted on to the sand. Each capsule contains a large number of eggs, but only a few of the embryos survive, as the result, it is said, of juvenile cannibalism. In Scotland *Buccinum undatum* is often called the Buckie, but the 'roaring buckie' is *Fusus antiquus*, a related form, which has a much longer siphon canal. The name 'dog-whelk,' or 'dog-periwinkle,' is given to *Purpura lapillus*, a small form very common among the rocks and very destructive to mussel-beds. It secretes a white fluid, which on exposure to air becomes a brilliant blue. Its egg-capsules are also common on the rocks, and look like little vases standing erect in clusters. Another common 'dog-whelk' is *Nassa reticulata*, abundant on the low-water rocks.

All these must be distinguished from the most edible whelk—the Periwinkle (*Littorina littorea*), a vegetarian Gasteropod not nearly related to the above. For anatomy, see GASTEROPODA.—*Whelk* is also an old name for Acne (q.v.).

Whetstones, or HONES, are used for sharpening cutting instruments of all kinds. For scythe and other large steel blades stones of a coarse texture or grain are used, but for putting a fine edge on chisels, razors, penknives, and engravers' tools fine-grained hones are employed. There are few known localities for such as have suitable fineness, hardness, uniformity of texture, and 'bite' combined in such a way as to form a first-rate hone. The three most favourably known are the *Turkish hone or oil-stone* from Asia Minor, composed of about 73 per cent. of silica intimately mixed with calcite; the *Arkansas hone*, consisting of 98 per cent. of silica; and the *German razor hone*, from near Ratisbon. The *Washita hone*, found in the same state and county, is cheaper and better suited for ordinary tools than the Arkansas stone. In Great Britain the best *hone slates*, as they are sometimes termed, are the *Charnley Forest stone* (Leicestershire); the *Welsh oil-stone*, or *Idwal stone;* the *cutler's greenstone*, also a Welsh rock; and the *Water-of-Ayr stone*. This last, a fine-grained argillaceous rock, rather softer than most hone-stones, is used for numerous other purposes besides sharpening tools. Several kinds of hone-stones are used for polishing hard surfaces—that of silver, for instance. *Hone-stone*, or *Novaculite*, is a very hard, fine-grained siliceous variety of clay-slate. Any hardish slate of smooth uniform texture will make a fine hone, and few countries are without some sharply gritted rock from which serviceable whetstones for sharpening large cutting blades or edge-tools can be made. There are instances of 'whetstones' made of wood with the pores filled up with some hard substance.

Whewell, WILLIAM, D.D., was born on 24th May 1794 at Lancaster. His father intended him for his own trade—that of a joiner; but the boy, having excelled at school in mathematics, went up in 1812 to Cambridge as an exhibitioner of Trinity College, and, after gaining the Chancellor's medal for the English prize poem in 1814, graduated in 1816 as second wrangler and second Smith's prizeman. He became a fellow and tutor of Trinity, where also for many years he acted as a successful 'coach,' or private tutor; in 1820 was elected an F.R.S.; between 1828 and 1832 was professor of Mineralogy in Cambridge, and between 1838 and 1855 professor of Moral Theology. In 1841 he succeeded Dr Wordsworth as Master of Trinity, and in the same year was President of the British Association at its meeting at Plymouth. He was also for a time President of the Geological Society. In 1855 he became Vice-chancellor of the university of Cambridge. He died at Trinity on 6th March 1866—the result of a fall from his horse. A large, strong, erect man, with a red face and a loud voice, Whewell was an effective preacher and lecturer, though in both characters wanting in that something which wins and rivets the hearer. He was accused of being arrogant; and one remembers the well-known Chinese music story, and Sydney Smith's saying, 'Science is his forte and omniscience his foible.' His knowledge was indeed encyclopædic, with all the defects of an encyclopædia; his works included *Astronomy and General Physics considered in Reference to Natural Theology* (Bridgewater Treatise, 1833), *History of the Inductive Sciences* (3 vols. 1837), *The Philosophy of the Inductive Sciences* (2 vols. 1840), *The Elements of Morality, including Polity* (1855), *The Plurality of Worlds* (1853), and other writings on the tides, electricity, magnetism, heat, German church architecture, the History of Moral Philosophy in England, &c., besides translations of Goethe's *Hermann and Dorothea*, Auerbach's *Professor's Wife*, Grotius' *Rights of Peace and War*, and Plato.

See Todhunter's *Whewell: an Account of his Writings* (1876), and the Life by Mrs Stair Douglas (1881).

Whey. See MILK.

Whichcote, BENJAMIN, one of the Cambridge Platonists, was born of a good Shropshire family, March 11, 1609, entered Emanuel College, Cambridge, in 1626, and became a fellow in 1633. For ten years a college tutor, in 1643 he took the college living of North Cadbury in Somersetshire, afterwards held by Cudworth, but a year later became Provost of King's College, Cambridge, in the room of the ejected Dr Collins. Yet he was far from being a Puritan, and he protected the interest of the provost and fellows with the most scrupulous care. And his influence upon the university was great. Already as a fellow he had been the tutor of Wallis, Culvervel, and John Smith, who says of his master, 'I lived upon him.' At the Restoration he lost his provostship, but held livings first at St Anne's, Blackfriars, together with Milton in Cambridgeshire, and finally the vicarage of St Lawrence Jewry, where he died in May 1683. He himself published nothing; and four volumes of *Discourses* (i.–iii., edited by Dr Jeffery, 1701; iv., by Dr Samuel Clarke, 1707), and *Moral and Religious Aphorisms*, collected from his MSS. by Jeffery (1703; new ed. by Dr Salter, containing his correspondence with Dr Tuckney, 1753), notable for vigour and point, are all his work. Whichcote was one of those teachers whose personality was greater than his intellectual productiveness, and his real significance must be sought in the impulse he gave to philosophical theology as seen in his own pupils and contemporaries—in Smith, More, and Cudworth, as well as Tillotson, Patrick, and Burnet.

See Principal Tulloch's *Rational Theology* (vol. ii. 1872), Bishop Westcott's *Essays in the History of Religious Thought* (1891), and vol. iii. of Bass Mullinger's *History of the University of Cambridge* (1892). The Earl of Shaftesbury edited a selection of his sermons in 1698, which was reprinted at Edinburgh by Principal Wishart in 1742. The best edition of his complete works is by Drs Campbell and Gerard (4 vols. Aberdeen, 1751).

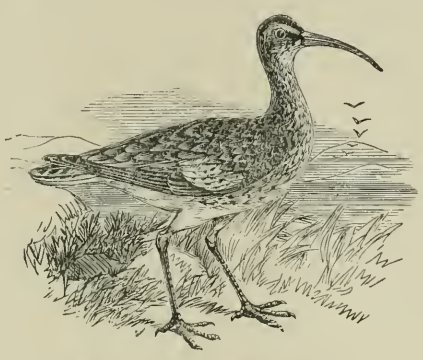
Whidah. See DAHOMEY.

Whig, a shortened form of *whiggamor*, a nickname of the peasantry of the Western Lowlands of Scotland, derived not from *whig*, 'sour whey,' but from *whiggam*, a sound used by them in driving their horses. The 'Whigamore Raid' is the name given to the march of 7000 western Covenanters on Edinburgh (1648), which sealed Charles I.'s doom; and we find the same term applied to the Covenanters of Bothwell Bridge (1679). Thence the name Whig came to be fastened first on the whole Presbyterian zealots of Scotland, and afterwards on those English politicians who showed a disposition to oppose the court, and treat Protestant nonconformists with leniency. Coming into use about 1679–80, Whig and Tory (q.v.) immediately became familiar words, and have been retained as designations of the two opposite political parties. These, however, since 1830 have been renamed Liberals and Conservatives, Whig being restricted to the more conservative members of the Liberal party, as opposed to Radical (q.v.).

In United States history it denotes those who in the colonial and revolutionary periods were opposed to the British rule; and also it is the name adopted in 1834 by the survivors of the old National Republican party, after its overwhelming defeat by Jackson in 1832. Jackson's bold action

in dismissing members of his cabinet, and his relentless war upon the United States Bank, made him in their eyes a tyrant little less hateful than George III., and the old name of Whig was chosen as expressive of their revolt against one-man power. Webster, Clay, and other National Republicans and old Federalists readily accepted the name, under which they were defeated in 1836, and in 1840 won their first great victory in the return of President Harrison. The party died in 1852, slain by the hands of its own dissatisfied members.

Whimbrel (*Numenius phæopus*), a bird of the family Scolopacidæ, allied to the curlew and closely resembling it in form, plumage, and habits, but smaller in size and having a much shorter bill. The Whimbrel—or Titterel, as it is often called—

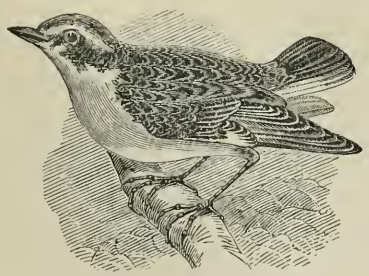


Whimbrel (*Numenius phæopus*).

is only a summer visitor to Great Britain, but it breeds in small and rapidly decreasing numbers in the Orkney and Shetland Islands. The adult bird measures about 17 inches in length, the female being rather larger than the male. See CURLEW.

Whin. See FURZE.

Whin-chat (*Saxicola rubetra;* see CHAT), a bird very similar in appearance, especially when it assumes its duller autumn plumage, to the Stonechat (q.v.). It breeds in many parts of northern and central Europe, as far south as Sicily; but is chiefly a migrant to Mediterranean countries, and winters southwards in Africa as far as the Fanti country and Abyssinia, eastwards in Arabia, Asia Minor, and Northern India. To



Whin-chat (*Saxicola rubetra*).

the British Islands it is a summer visitor, arriving in the middle of April, and reaching its northern quarters about the beginning of May. In Ireland it is rare. It feeds on beetles, insects, worms, and small molluscs. Its song is pleasant. It frequents heaths and commons, whence its name of 'Grasschat;' and it roosts on the ground. The female is duller in colour than the male.

Whinstone, a popular name in Scotland for any hard and compact kind of stone, as contradistinguished to sandstone or freestone and rocks of slaty structure. Thus in Scotland it is the common appellation of such rocks as basalt and its varieties, porphyrite, greywacke, &c., whilst in some districts it is applied to granite.

Whipping. See FLOGGING, KNOUT. Of innumerable kinds of whips—coach-whips, horse-whips, dog-whips, &c.—the types vary from a slender pliant switch all in one piece to a short stiff handled whip with a very long lash. The stock-whip of Australia, a riding whip, has a short handle of 2 feet, with a lash 15 feet. The wagon-whip of South Africa comprises a long, tapering bamboo of 14 or 15 feet, and a lash about as long; it is a two-handed whip, wielded usually by a man on foot.

Whip-poor-will (*Caprimulgus* or *Antrostomus vociferus*), a species of Goatsucker (q.v.), a native of North America, common in the eastern parts of the United States, and often imagined to be identical with another goatsucker, the Nighthawk (*Chordeiles popetue*). It receives its popular name from the fancied resemblance of its notes to the words *Whip poor Will*. It is about 10 inches long, the plumage very like that of the European goatsucker, much mottled and indistinctly marked with small transverse bands, the top of the head streaked with black, a narrow white collar on the throat. The bristles at the base of the bill are very stiff, and more than an inch long, and the tail is rounded, the lateral feathers largely white in the male. This bird is seldom seen during the day, but seeks its food by night, catching moths, beetles, and other insects on the wing. Its flight is near the ground, zigzag, and noiseless. Its notes are heard only during the night, and are clear and loud, so that when a few of these birds are close at hand the noise is such that those unaccustomed to it cannot sleep. In the more southern parts of the United States the whip-poor-will is replaced by a larger species, the Chuck-Will's-widow (*C.* or *A. carolinensis*), and which, like the whip-poor-will, takes its name from its cry, and to the west by a smaller one (*C.* or *A. Nuttalli*) having a somewhat similar cry to the whip-poor-will, but feebler. See Baird, Brewer, and Ridgeway's *North American Birds* (Boston, 1874).

Whip-snake, a name given in North America to various species of the genus Masticophis (especially *M. flagelliformis*, the coach-whip snake, 4 to 5 feet long, slender, and harmless); as also to species of Philodryas, of Passerita, &c.

Whirlpool, a circular current in a river or sea, produced by opposing tides, winds, or currents. It is a phenomenon of rare occurrence on a large scale, but illustrations in miniature may be noticed in the eddies formed in a river by means of obstacles or deflections. The two celebrated sea-whirlpools Charybdis (see SCYLLA) and Maelström (q.v.) are now known to be merely 'chopping seas,' caused by the wind acting obliquely on a rapid current setting steadily in one direction while the tide is flowing, and in the opposite direction when it is ebbing. During calm weather neither of these so-called whirlpools is dangerous for large ships, but when the current and the wind are strongly in opposition the broken swell is so violent and extensive in the Maelström as to founder large ships, or drive them against the rocks. Though in neither of these two cases, formerly so much dreaded, is there any vortical action, instances of such action do actually occur in various localities, as in the whirlpool of Corrievrekin (q.v.), and in some eddies produced by opposing winds and currents among the Orkney Islands.

Whirlwinds and **Waterspouts.** Whirlwinds differ essentially in nature from the storms of wind described in the articles STORMS. Individual whirlwinds seldom continue longer than a minute at any place, and sometimes only a few seconds; their breadth varies from a few yards to nearly a quarter of a mile, and during their short continuance, the changes of the wind are sudden and violent. If a fall of the barometer is recorded it is virtually instantaneous, and is immediately followed by a rise equally as sudden as the previous fall. The direction of the eddy of the whirlwinds, especially when the diameter is very small, differs from the rotation of winds in a storm in that it may take place either way—right to left, or left to right—according to the direction of the stronger of the two winds which give rise to the whirlwind. Whirlwinds often originate within the tropics during the hot season, especially in flat sandy deserts; since these becoming unequally heated by the sun give rise to ascending columns of heated air and descending currents of cooler air contiguous to them, which result in eddies that draw up with them large clouds of dust; and the whole is borne forward by the wind that may happen to be blowing at the time. This is the origin of the *dust whirlwinds* of India, locally known as 'dust devils,' which have been admirably described and illustrated by P. F. H. Baddeley. These dust-storms are frequent in dry, hot regions; and in the case of the *Simoom* (q.v.), which may be regarded as a succession of such whirlwinds, they appear on a scale of the most appalling grandeur.

Extensive fires, such as the burning of the prairie in America and the bush in Australia, and volcanic eruptions also cause whirlwinds by the ascending and descending currents of air they occasion; and these, as well as the whirlwinds already mentioned, are generally accompanied with heavy rains, hail, and electrical displays. Whirlwinds are also of frequent occurrence in France and many other countries, doing great damage to vineyards and other crops; but in Great Britain they seldom occur.

Waterspouts are whirlwinds occurring on the sea and other sheets of water. When fully formed they appear as tall pillars of cloud stretching from the sea to the sky, whirling round their axes, and exhibiting the progressive movement of the whole mass precisely as in the case of the dust-whirlwind. The sea at the base of the whirling vortices is thrown into violent commotion, resembling the surface of water in rapid ebullition. It is a popular fallacy that the water of the sea is sucked up in a solid mass by waterspouts, it being only the spray from the broken waves which is carried up. Observations of the rain-gauge conclusively prove this.

What are sometimes called 'waterspouts on land' are quite distinct phenomena. They are merely heavy falls of rain of a very local character, and may or may not be accompanied with whirling winds. They generally occur during thunderstorms, or in the vicinity of thunderstorms, being quite analogous to severe hailstorms, from which they differ only in point of temperature, the heavy drops being probably no more than melted hailstones. Also all the moisture that falls is the result of condensation; whereas, in the true waterspout, the rain is mixed with spray which has been caught up from the broken waves, carried aloft by the ascending currents of the whirlwind, and ultimately precipitated with the rain.

Whisky (Gaelic, *uisge*, 'water;' *uisge-beatha*, modified into *usquebaugh*, 'water of life'), a spirit made by the distillation of the fermented extract from malted and unmalted cereals, potatoes, or any starch-yielding material. The best qualities are made either from malted barley alone, or from a mixed grist of barley-malt and dried barley and oats. Very large quantities of maize and rice are now used, whilst sugar and molasses, and smaller quantities of wheat, rye, sago, and other materials are employed. On the Continent potatoes and beet-root are extensively used, and artichokes and other roots are also employed. The mode of manufacture is described under DISTILLATION. Pure malt-whisky is almost exclusively made in Scotland, and always has been so, the pot-stills being used in the distillation. In Ireland pot-stills are most generally used, but, with the exception of two or three distilleries, malt forms only about one-third of the materials mashed, the remainder being barley, oats, and maize. In England large quantities of spirit are distilled by Coffey's still from a wort prepared from the raw cereals with some malt and sugar, whilst a few of the largest Scotch and Irish distillers make a portion of their produce in the same way. Much of this quality of spirit is used for making methylated spirit, and much for making gin, British brandy, and cordials, whilst some is used for blending with the pot-still spirit or whisky. Quantities of whisky identical with Irish are now made in Scotland. Wales has also its whisky distillery, and in England a few distillers are once more returning to pot-still whisky. Large distilleries for grain-spirit are at work in the United States, and for grain and potato spirit in Prussia, Sweden, France, Holland, Belginm, and Russia. Spirit is also distilled in Australia (Melbourne). The continental spirit, though of high strength and great purity, is more suitable for methylation, for fortifying wines, and for manufacturing and scientific purposes than for a beverage. In 1891 there were 9 distilleries in England and Wales, 136 in Scotland, and 31 in Ireland, The quantities of whisky for each of the three countries in that year were in gallons:

	England and Wales.	Scotland.	Ireland.
Proof-spirit manufactured.....	10,533,637	21,101,023	12,988,924
Consumption as beverage.....	18,458,548	6,549,859	4,821,146
In Bonded Warehouses..	9,912,952	54,312,195	26,903,477
Consumption per head.....	·627	1·589	1·026

Thus the spirits in bond are equivalent to three years' consumption. In 1897 the quantity charged with duty was 13,102,404 gallons in England, 12,434,265 in Scotland, and 8,176,459 in Ireland. The revenue derived from the excise duties on spirits in the United Kingdom was in the year 1897–98 £16,400,000. The export in 1897 was 4,652,600 gallons; nearly half to Australia, much to the East Indies and West Africa. Spirits exported are free of duty, and a drawback of 2d. per proof gallon is allowed. Proof-spirit consists of nearly equal portions by weight of water and absolute alcohol, the exact proportions being water, 50·76; alcohol, 49·24. The legal definition of proof-spirit is such as at 51° F. weighs twelve-thirteenths of an equal bulk of distilled water: its specific gravity is ·9231 at 51° F. With the present excise duty at 10s. 6d. per proof gallon, the distiller is slightly protected by the tax on foreign spirits being 10s. 10d. per proof gallon. The manufacture of whisky in the United Kingdom is under the control of the excise, and the principal governing statute is the Spirits Act, 1880.

In England and Scotland whisky gradually displaced the monopoly as a beverage formerly held by gin and brandy of continental origin. Distilling was practised in England as early as the 11th century, but was confined to the monasteries, the produce being used as a medicine. During the Tudor period distilling as a trade commenced, monopolies and charters were granted occasionally, and a system of licensing was adopted and greatly

abused. Home or private distilling from grain was introduced into England from Ireland by settlers in different counties. In Scotland during the 14th century whisky had already displaced much of the imported continental spirit; the monasteries had for a long time preserved the secrets of distillation. By the middle of the 16th century a large trade was established, and house or cottage stills were found in all parts. In 1579 Scotch distilleries were taxed for the first time, and private distillation was interfered with. In Ireland as early as the 11th century the natives distilled 'uisge-beatha,' and no interference occurred till the 16th century, when licenses were enforced in the case of all but the gentry, offenders being made liable to capital punishment.

During the Great Rebellion the excise-tax on spirits originated in all parts of the kingdom. It was placed at 8d. per gallon in England, but was reduced to 2d; in Scotland and Ireland the tax was on the retailers; and the duties were 'farmed out' in all three countries. In Scotland by the time Charles II. was restored a considerable revenue was obtained. Soon after the Restoration the duty was fixed in England at 1d. per gallon, but it soon rose to 8d. per bulk gallon. Varying rates were subsequently established according to the materials used, the tax being levied upon the wort, which, according to its origin, was expected to yield 20 to 25 gallons of spirits per 100 gallons of the wort. In 1736, with the object of suppressing drunkenness, 20s. per gallon of spirits was levied on the retailer, a high license was charged, and the distiller's tax raised. But seven years' experience compelled the repeal of these provisions, for illicit distillation and illicit sales were enormous. The spirit tax was continued upon the wort, and for many years the rate stood at or near 2s. per gallon, with an expected yield of 19 gallons of spirit per 100 gallons of wort, so that the net tax on spirits was 2s. $\times \frac{100}{19} = 10$s. 6d. per gallon. This high estimated yield forced distillers to use very strong wort, hence the spirit distilled was coarse, and the whole of the English produce went through the rectifier's hands before it was fit for consumption.

In Scotland at the Restoration the spirit tax was remodelled; and in some cases fixed sums were levied upon certain districts in lieu of the tax. Towards the end of the 17th century private distillation was again taxed, the taxes being as a rule farmed out; but the people vigorously resented the interference, for the licensing regulations were severe and unequal. At the Union the English system of levying the spirit duty on the trade distillers was introduced—viz. by an estimated spirit yield from the wort—and this system prevailed for the next eighty years, during which period the trade made great advances. Though the tax was similarly levied to the English method, it was not so heavy, so that Scotch whisky could be sold in London more cheaply than that of English make. The Scotch tax permitted of a lighter wort being made, so that the produce was less coarse than the English and did not require rectifying; a large English trade accordingly sprang up. But in 1784 the English distillers succeeded in getting the Scotch tax raised to an equality with their own, and 20 gallons at 1 to 10 over proof were expected from every 100 gallons of wort. Fine whisky could no longer be profitably made from a light wort; and if a stronger wort were used the spirit was coarse. The Highland distillers at this period only paid a license on their stills, and the Lowland distillers were in danger of being extinguished; but they succeeded in 1786 in getting the famous 'license system' introduced and the English system discarded. Still the Highlanders had great advantages in the license rate, and could sell in the Lowland markets. The Lowlanders soon brought skill to their aid. The original license rate was 30s. per annum for each gallon of the still's capacity, and an estimated rate of speed was allowed for in fixing this charge. By various improvements the enterprising distillers were able to far exceed the estimated spirit yield, and when this became known the tax was raised to £3, and so on till in a few years it mounted to £160 in some cases. No two distillers were taxed alike, and gross inequalities prevailed. To secure their high yields from taxation, smuggling was resorted to, and more particularly across the Border. The interference with cottage stills, especially in the Highlands, had encouraged illicit distillation; Glenlivet being famous as the home of the smugglers. The law was in fact defied, and even those in authority connived at the illegal practices; the revenue officers were powerless. Licensed distilleries were in some cases destroyed by the people. For many years smuggled spirit ruled the markets, and it is believed that for every licensed distiller either in town or country there were fifty or a hundred unlicensed ones. Not one-half the legitimate revenue was secured. Eventually, during the last years of George III.'s reign, the 'license system' was abolished and the English system again introduced with all its abuses. The estimated spirit yield being placed too high, the Scotch distillers were again threatened with ruin; the trade and the revenue fell off, so that by mere compulsion wiser regulations and a more moderate tax were adopted in 1816. Highland and Lowland systems were assimilated, but the smuggling so universally established could not be readily eradicated, and as late as 1822 not one-half the spirits made in Scotland paid duty. Trade fluctuations may be judged by one illustration; in 1816 there were only 36 licensed distillers in Scotland; next year, through some slight alteration in the law, there were 108.

In Ireland at the Restoration 4d. per gallon was imposed upon distilled spirits; and this duty continued for fifty years, but was then gradually raised till in 1815 it stood at 6s. 1½d. The license system as in Scotland was tried in Ireland; in 1779 no less than 1152 stills were licensed. An arbitrary number of distillings per still was recognised; it varied with the size of the still, but inversely, a still of 200 gallons capacity being assumed to work oftener than one of 500 gallons. This system favoured the large traders, so that of 210 trade distillers in 1798 only 51 survived in 1806, and then a license was refused for any still below 500 gallons content. As in Scotland for many years, a race took place between increased skill and an increased tax, whilst new inventions were discouraged by the government. The refusal to license the small stills immediately led to extensive smuggling from illicit stills (the produce of which was specially known as *potheen*). The smuggling was so universal that in 1815 to discourage illicit distilleries licenses were granted to stills of only forty gallons content. The smuggling flourished however, large illicit imports coming from Scotland. The restrictive legislation in Ireland accounted for the fact that, whereas in 1792 nearly 3½ million gallons of whisky paid duty at 1s. 2d. per gallon, yet thirty years after, with double the population, a considerably smaller number of gallons was charged when the rate was 5s. 6d.

During the reign of George IV. the present mode of charging the spirit duty upon the quantity at proof strength was introduced successively into Scotland, Ireland, and England. The table shows

the rates in the three countries during the 19th century:

	England.		Scotland.		Ireland.	
	s.	d.	s.	d.	s.	d.
1802...	5	4½	3	10½	2	10¼
1811...10		3	8	0¼	2	6½
1820...11		8¼	6	2	5	7¼
1830...	7	6	3	4	3	4
1840...	7	10	3	8	2	8

	England.		Scotland.		Ireland.	
	s.	d	s.	d.	s.	d.
1859...	8	0	8	0	8	0
1860...10		0	10	0	10	0
1885...12		0	12	0	12	0
1886...10		0	10	0	10	0
1890...10		6	10	6	10	6

Although illicit distillation on the large scale is occasionally attempted now, it is quickly suppressed. In the Highlands of Scotland a few detections are still made annually, but those in Ireland are very numerous, and average some fifteen or sixteen hundred annually. From the revenue point of view the loss is insignificant. The whisky retailed throughout the United Kingdom is generally of pure quality, though often too new. Occasionally attempts are made to remove from methylated spirit its distinctive odour and to retail it for drinking, whilst ether is also manipulated for sale in poor and populous neighbourhoods. The warehousing system was introduced for the convenience of distillers in 1804 in Ireland, extended to Scotland in 1823, and to England in 1848. The bonding system is now very extensively adopted.

Very recently a number of processes have been patented for artificially 'ageing' or maturing whisky, by electrical appliances or by aeration and flavouring. It is unlikely that the excise will permit any such processes to be applied to bonded spirits, so that they must be confined to duty-paid spirits. The practice known in the trade as 'grogging' as applied to whisky casks, and so extensively pursued from 1880 to 1890, has by the excise regulations of 1892 been peremptorily stopped.

Although the Select Committee on British and Foreign Spirits which sat in 1890 and 1891 were unable to settle upon any definition for whisky, yet much valuable information was collected. Compulsory bonding was not advocated, on account of its being unnecessary and impracticable. All British and Irish spirits, whether of pot-still or patent-still origin, were to be continued to be described as 'Plain British,' whether blended or not. It was shown, too, that out of an annual consumption in the United Kingdom of some 28 or 29 millions of proof gallons about 16 million gallons were from pot-stills. Of the total quantity of patent-still whisky or 'silent spirit' made in the United Kingdom about one-fourth was used for blending with pot-still whisky, and another fourth was sent to the rectifiers for manufacture into gin and cordials, but much patent-still whisky went straight into consumption.

Blending of whiskies and spirit of different origin is largely carried out in bond, and doubtless very extensively in the duty-paid stocks of dealers and retailers. Blending of pot-still and patent-still spirit is defended upon two grounds—viz. the mildness of the product and its cheapness; the latter being likewise the chief reason for the large blending operations. All commercial spirit, however pure, contains a small proportion of impurities or by-products of distillation, known as 'fusel-oil.' Fusel-oil includes the alcohols other than ordinary or ethylic alcohol, and it consists of propylic, butylic, and chiefly of amylic alcohol, with lesser quantities of still higher alcohols. Along with these alcohols there are minute quantities of acids, of ethers, and of pyro-compounds, the chief constituent of the latter class being furfurol. It has always been alleged that during the 'maturing' or 'ageing' of whisky these constituents of fusel-oil underwent decomposition, but the analyses of Dr Bell of Somerset House totally disprove this supposition. The only ingredient of fusel-oil that can be proved to diminish during storage is the furfurol, and this at a very slow rate. The probable cause for increased flavour and aroma in bonded whisky is the interaction of the spirit upon the bodies absorbed by the wood from the wine previously contained in the casks. This statement is supported by the fact that whisky stored in wine-casks soon doubles its original percentage of acidity whilst other constituents remain the same. Improved methods of 'maturing' spirits rapidly are based upon these facts. The total percentage of the bodies known collectively as fusel-oil ranges in pot-still whisky at proof strength from ·13 to ·21, and in patent-still or 'silent' spirit from 'nil' to ·05. Fusel-oil in less quantities than ·3 per cent. per proof gallon is harmless.

Whisky when first made is quite colourless, and all the admired colours of favourite brands or their imitations are produced either by storage in sherry and other wine casks, or by the direct addition of a little caramel syrup or of a 'maturing wine' to the spirits. The new whisky as it runs from the last distillation in a pot-still distillery varies in strength from proof to 50 over proof; at the latter strength it contains 80 per cent. by weight of pure alcohol. The strength varies with the mode of working. The patent-still spirit on the other hand, very properly called 'silent' spirit from its flavourless and other negative qualities, ranges in strength from 65 to 70 over proof as it runs from the still: at the latter strength it contains over 95 per cent. of pure alcohol by weight, and is of specific gravity ·8079 at 60° F. The chief centres of whisky distilling are the small towns and numerous villages in the Highlands and the Western Highlands of Scotland. Much is made in the Lowlands too. Large quantities of plain, patent-still, or 'silent' spirit are made in Edinburgh, Glasgow, and the towns near those places. Irish whisky is chiefly made in Dublin, and almost exclusively from pot-stills. It is also made in Belfast, Cork, Londonderry, Limerick, and many other towns, but large quantities of patent-spirit are also made in the same towns. In England almost the whole of the spirit production consists of patent-spirit, London and Liverpool being the centres of the manufacture. Pot-still whisky is now made at Bristol, and at Frongoch in North Wales.

In the United States spirit manufacture is largely carried on, the spirit being commonly made from maize (corn whisky) or rye. Wheat also is largely used. Bourbon whisky was a term originally given to whisky made of wheat or maize in Bourbon county, Kentucky. The whisky from Pennsylvania and the brand known as 'Hermitage Bourbon' from Kentucky are best known and obtain high quotations. The chief distillery states are Illinois, Ohio, Kentucky, Indiana, New York, and Pennsylvania. As in Britain, the tax on distilled spirits is the most important source of internal revenue from manufactures. In the United States the tax was first imposed in 1791, but led to the Whisky Insurrection (q.v.), and was abolished. Reimposed during the war years 1812–15, it was renewed till 1862, when the rate was 20 cents per gallon manufactured; in 1864 it was raised to 60 cents, to $1·50, and to $2. In 1868 it was reduced to 50 cents; in 1872 it was 70 cents; in 1875 it was fixed at 90 cents, at which it was retained. But during 1868–72 various additional taxes were imposed on distilling and distillers amounting to nearly 70 cents per gallon more. In 1863 the revenue from spirits was $5,176,530; in 1864, $30,329,150; and with violent fluctuations from year to year it rose to $55,606,094, but did not again reach so large a figure till 1876 and 1877. In 1880 the figure was $61,185,509; in 1884 the figure was $76,905,385, out of a total internal revenue of $121,368,620. After that date a decline set in.

The duty on imported spirits under the M'Kinley tariff was fixed at $2·50.

See, for history, Morewood's *Inventions and Customs in the Use of Inebriating Liquors* (1824), and Scarisbrick's *Spirit Manual* (1891); and for technical processes, Maercker's *Handbuch der Spiritus-fabrikation* (4th ed. 1886), and *The Manufacture of Spirits*, by the present writer (1892). See also the articles ALCOHOL, EXCISE, FUSEL-OIL, SMUGGLING.

Whisky Insurrection, the somewhat extravagant title for an outbreak which occurred in Western Pennsylvania in the summer of 1794. It arose from discontent with the excise regulations, and culminated in open riot and the destruction of private property; but by the efforts of leading citizens the rising was quelled without the aid of the 15,000 troops which Washington promptly sent against the insurgents.

Whist, a game at cards, believed to be of English origin; probably a development of the game of *trump* (or *triumph*), which was played in England at least as early as the time of Henry VIII. Trump is mentioned in a sermon delivered by Latimer on the Sunday before Christmas 1529. The game of trump is also mentioned by Shakespeare punning on the word triumph in *Antony and Cleopatra*, act iv. scene 12. The game of whist is not mentioned by Shakespeare, or by any writer of the Elizabethan era.

The earliest mention of *whist* (or *whisk*) is in the poems of Taylor the Water-poet (1621). In the first edition of Cotton's *Compleat Gamester* (1674) whist is described as a game 'commonly known in England.' Cotton says that 'the game of whist is so called from the silence that is to be observed in the play;' this derivation was adopted by Dr Johnson, to the extent of explaining whist to be a game requiring silence, and it has been generally accepted by modern etymologists.

Whist was formerly played nine-up. The change to ten-up took place about the first quarter of the 18th century. Whist played ten-up is called *long whist*. About 1785 the experiment of dividing the game into half was tried, and *short whist* was the result. The short game soon came into favour; and in 1864 the supremacy of short whist was acknowledged by the adoption as the standard of the laws of short whist framed by committees of the Turf and Portland clubs.

Edmond Hoyle (q.v.), the first writer of any celebrity on whist (commonly called the father of the game), published his *Short Treatise* in 1742. He used to give lessons in whist at a guinea a lesson. His *Short Treatise* ran through many editions during his lifetime; and since his death his works have been reproduced in numberless ways. Hoyle died in Welbeck Street, Cavendish Square, on August 29, 1769, at the age, so it is said, of ninety-seven.

The game of whist is played by four persons, two being partners against the other two. The partners sit opposite to each other. The partnership is determined by cutting. The two lowest are partners against the two highest, and the lowest has the deal and the choice of seats and cards. In cutting, the ace is lowest. Each player has a right to shuffle the pack once before each deal, the dealer having the privilege of a final shuffle. The shuffling being concluded, the player to the dealer's right cuts the pack. The dealer, having reunited the packets, is bound to deal the cards one at a time to the players in rotation, beginning with the player to his left. He turns up the bottom card (called the trump card). The deal being completed, the players sort their cards, and the player to the dealer's left (or leader) plays a card face upwards on the table. The other players follow in rotation, being bound to follow suit if they can. When all have played, the trick is complete. It is then gathered and turned over by the winning side. The highest card wins the trick. The ace is highest in playing; and the other cards reckon in the order king, queen, knave, ten, &c., down to the deuce, or two, which is lowest. If any player cannot follow suit (i.e. has none of the suit led), he may play any card he pleases. If he plays a card of the suit turned up (called trumps), he wins the trick, unless another player also, having none of the suit led, plays a higher trump. The player who wins the trick becomes the leader for the next trick, and so on till the whole hand (consisting of thirteen tricks) is played out.

After scoring, the player to the last dealer's left deals in his turn; and in subsequent deals each player deals in turn, the rotation going to the left.

Scoring.—The side winning more than six tricks reckons one for each trick above six; and the side holding, either separately or conjointly, more than two of the following cards, ace, king, queen, and knave of trumps (called honours), reckons as under: If they hold any three honours, they score two; if they hold four honours, they score four. Players who are at four cannot score honours. The side first reaching five, in one hand or in a succession of hands, scores a game, valued thus: a single, if the adversaries have already scored three or four; a double, if they have scored one or two; a treble, if they have scored nothing.

A rubber consists of the best two games out of three. If the same players win two consecutive games, the third is not played. The winners of the rubber score in points the value of the games they have won; when the rubber has consisted of three games, the value of the loser's game is deducted. And whether two or three games are played, two points are added for the rubber. Thus, if A B (partners) win a single and a double, they win three points on the games, and they add two for the rubber, making five points. Had A B won the same, but Y Z (their opponents) won a treble, they would have to deduct three points, the value of the opponents' game, and would win only two points.

Whist is a mixed game of chance and skill. The chance resides in having trumps and other good cards dealt. The skill consists in the application of such knowledge as shall, in the long run, turn the chances of the cards in the player's favour. At the commencement of the hand, the first lead presents a problem of almost pure chance; but as the hand proceeds observation of the fall of the cards, inference therefrom, memory and judgment come in, so that the end of a hand often presents a problem of pure skill. It is these ever-varying gradations of skill and chance that give the game its chief interest as a scientific pastime.

To become a skilful player it is necessary to bear in mind that the game is not one of any given player's hand against the other three, but a combination of two against two. In order that two partners shall play their hands to the best advantage, they must strive, as much as possible, to play the two hands as though they were one. To this end it is advisable that they should pursue some uniform system of play, so that each partner shall understand the plans of the other, and be placed in the most favourable position to assist him in carrying them out. The experience of a hundred and fifty years has developed a system of play tending to this result.

1. The first, or *original*, lead should be from the player's strongest suit. A strong suit is one that contains either a large number of cards (four or more) or several high cards. The suit containing the largest number of cards (numerical strength) is the one to be mostly preferred. The object

aimed at in opening the strongest suit is to exhaust the cards of that suit from the other hands. When this object is accomplished, the cards of the suit which remain in the leader's hand (called long cards) obtain a value which does not intrinsically belong to them. They often become of great service, for when led they either compel the adversary to trump or they make tricks. And when trumps are all out the player who has the lead makes as many tricks as he has long cards. On the other side, by opening weak suits there is considerable risk of sacrificing partner's strength, and of leaving long cards with the opponents.

2. Some players are prone to lead single cards, but experience shows that weak leads, as a rule, do more harm than good. Sometimes a trick or two is made by playing a trumping game; but the chances are that such tactics sacrifice partner's hand, and clear the suit for the adversaries.

3. The leader should open with the lowest card of his strong suit, in expectation that the third hand will play his highest, and so assist in clearing the leader's strong suit. Moreover, if the leader keeps the best cards of his suit in his own hand, he has a fair chance of getting the lead again when his suit is nearly or quite established. But with ace and four or more small ones it is advisable to begin with the ace, lest the ace be trumped on the second round. Also, with a high sequence in the strong suit it is best to lead one of the sequence first, lest the adversaries win with a very small card.

4. For the ordinary leads from high sequences any elementary work on whist may be consulted. For refinements on the American system of leading, and also for the cases in which the fourth-best card should be led in preference to the lowest, the more advanced treatises of 'Cavendish' may be referred to.

5. After the first trick the lead may remain with the first leader. His best play, as a rule, is to continue his suit. If the lead falls to another player, his play will be, in most cases, to open his best suit; and so on. If the lead falls to the first player's partner, he has choice of two modes of play. If he has a very strong suit of his own, he would often be right to open it; if not, he would generally do well to continue the suit his partner first led, or, as it is commonly called, to return his partner's suit. The object is to strengthen partner by assisting to clear his strong suit.

6. When returning a suit, if the player has only two cards of it remaining in his hand, he should return the highest; if more than two, the lowest. The exception is, if he has the winning card, he should return that irrespective of the number of cards in the suit. The reason is that with but two cards of the suit remaining the player is weak in the suit, and he is therefore bound to sacrifice his good card to support his partner. But with three or more remaining after the first round he is strong, and is therefore justified in calling on partner to support him.

7. This rule of play is most important. It should be carefully observed with even the smallest cards, as it enables partner to determine the situation of the remaining cards. For example: A leads a suit in which B (his partner) holds ace, three, and two. In returning A's suit, after winning with the ace, B is bound to return the three, and not the two. When B's two falls in the third round A will know that his partner has no more of the suit. But suppose B's cards to be ace, four, three and two. In returning the suit B is bound to choose the two. Then after the third round A will conclude with certainty that B has at least one more card of the suit.

8. Late in a hand the considerations with regard to the lead vary. If there is no indication to the contrary, it is best for each side to continue the suits originally opened by them. But the fall of the cards may show that it is disadvantageous to persevere in the suits first led. In such cases the player must have recourse to other and weaker suits. The general rule to be observed here is to choose a suit in which there is reason to infer that the right-hand adversary is weak, or—but this is less favourable—one in which the left-hand adversary is strong. In either case, if the suit chosen contains but three cards, none higher than knave, or only two cards, it is in most cases right to lead the highest.

9. The second player, as a rule, should play his lowest card, in order to preserve his strength in the leader's suit. The first trick in the suit is left to partner, who has an even chance of holding a better card than the third player. But if the second hand has a strong sequence, he should play the lowest of the sequence, by which partner's hand may be saved, and a high card still remain over the original leader.

10. When a high card is led it is sometimes advisable for the second player to cover it with a higher one. For details of the play of the second hand, as regards playing a high card, or covering the card led, some systematic treatise should be studied.

11. When the second hand has none of the suit led he should trump, if he has but two or three trumps; but he should not trump a doubtful card if he has more than three trumps. This will be further explained when treating of the management of trumps.

12. The third hand, as a rule, plays his highest card in order to support partner in his suit. The exceptions are: with ace, queen, &c. the queen is to be played; and if partner has begun with a high card, it is often right to pass it.

13. *Management of Trumps.*—With strength in trumps (i.e. with four or more) they should not be used for trumping, if it can be avoided, but should be kept together, in hopes of establishing a suit, and of remaining with the long trump, with which to get the lead after the other trumps are out, and so to bring in the suit. Thus if the opponents lead a losing or doubtful card it is better, as a rule, not to trump it when holding four trumps. But if the opponents lead a winning card it is generally advisable to trump it, though holding four trumps.

14. With five trumps the chance of succeeding in exhausting the opponents' hands, and of remaining with the long trump, is so considerable that a player having five or more trumps should lead them; and as number is the principal element of strength, he should not be deterred from leading trumps merely because the fourth hand has turned up an honour.

15. With four trumps only, first lead the strong suit. When the adversaries' hands are cleared of that suit, or so far cleared that the holder of the long cards in that suit commands it, it is, as a rule, safe to lead from four trumps.

16. A player is only justified in leading from weak trumps if he holds winning cards in every suit; if the adversaries are both trumping a suit; or if the game is lost unless partner has strength.

17. It is most important to return partner's trump lead at once, unless he has led from weakness; for partner, by leading trumps, declares a strong game, and it is then the best policy to abandon one's own plans, and to support his.

18. It follows that a player should seldom lead a card for his partner to trump, unless he has four or more trumps; for with less than four trumps he is weak; if he forces his partner to trump, partner is weakened also; and the chances are that by weakening partner under such circumstances the command of trumps will remain with the adversaries.

19. But a player may force his partner, although

weak himself, if partner has already been forced, and has not afterwards led trumps; if partner has already declared weakness in trumps, as by trumping a doubtful card second hand; if two partners can each trump a different suit; and when one trick from partner's hand wins or saves the game.

20. The same considerations which make it inexpedient to force partner when weak one's self show the advantage of forcing a strong trump-hand of the opponents.

There are yet some general rules of play to be explained.

21. The second, third, and fourth players should always play the lowest of a sequence. The rule here given is in conformity with the play that would naturally be adopted in playing cards that are not in sequence; and by keeping to a uniform plan players are enabled to infer what cards their partner does or does not hold. It is true that the adversaries often gain the same information; but it is found by experience that it is of more advantage to inform partner than to deceive the opponents.

22. As a rule, it is advisable to lead out the winning cards of partner's suit. The presumption is that he has led from his strong suit; and by leading out the winning cards the suit is cleared for him, and his long cards are not obstructed. The reverse applies to suits led by the adversaries. It is mostly right to retain the winning cards of such suits as long as possible, in order to stop the establishment of the suit.

23. When a player has none of the suit led, he should throw away from his weakest suit; for by discarding from a strong suit its numerical power is damaged. But when the adversaries have shown great strength in trumps it is not advisable to keep small cards of a long suit, as it is not likely that it can ever be brought in. Under such circumstances the player should throw away from his best protected suit, and keep guards to his weaker ones.

24. Players should watch the cards as they are played, and endeavour to infer from them where the others lie. Thus, if a player wins a queen with an ace it may be inferred that he has not the king, the rule being to win with the lowest; if a player leads trumps at starting it may be inferred, as a rule, that he is strong in trumps, or has a very fine hand. By recording in this way, and by counting the number of cards played in each suit, skilled players will often, towards the close of a hand, know the position of all the important cards remaining in; and by means of this knowledge they will be able to play the end of the hand to the same advantage as though they had seen all the cards.

25. And lastly, players should play to the score. Thus, wanting but one trick to save or win the game, a winning card should be played at once. The example is stated as for one trick; but it should always be kept in mind how many tricks are requisite to win or save the game, or even a point, and the play should be varied accordingly.

ILLUSTRATIVE HAND.

The following example is given to show how the play at whist is conducted in accordance with the preceding general rules, and also how inferences from the fall of the cards may be drawn and used. The example is of the simplest kind, and is not intended to exhibit any fine stroke of play. A, Y, B, and Z are the four players; they sit round the table in the order of the letters, A B being partners against Y Z. A is the first leader, and Z the dealer. We will suppose the reader to be A, the score to be love-all, and Z to have turned up the two of hearts.

A's Hand.

Ace, 2 of.....Spades.
Queen, 8, 7, 4 of.....Hearts.
9, 6, 5 of.....Clubs.
Queen, Knave, 7, 2 of.....Diamonds.

[*Note.*—It is a great assistance to inexperienced players to sort A's hand from a pack, and play a card to each trick from the remainder of the pack, as would be done in actual practice.]

THE PLAY.

[*Note.*—The cards in each trick are placed in the order in which they are played, the leader's card standing first. The capital letter in front of each card shows by whom it is played.]

Trick 1. A leads. A Y B Z Trick 1. Y wins.

Remark.—A leads from his strongest suit. He leads the lowest card of it. (For reasons, see above, sects. 1, 3.)

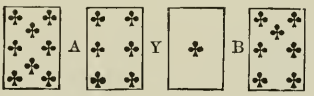
Inferences.—B being unable to win the king, A should note that the best diamond is against him, probably in Y's hand as the rule is with ace and king to put on king second hand. Some players put on king second hand with king and one small one; but the smallest should generally be played, unless the second hand holds a sequence. B dropping the nine, and A holding queen and knave (refer to A's hand), A concludes B to have ten or no more, the rule being to play the smallest when unable to head the trick.

It is in this way, by comparing the cards which fall with those remaining in hand, that players obtain an insight into the game to guide them in their future conduct.

Trick 2. Y leads. Y B Z A Trick 2. Z wins.

Inference.—A infers clubs to be Y's strongest suit. This inference does not affect the subsequent play. But it might; and, at all events, it is an inference that A ought to draw.

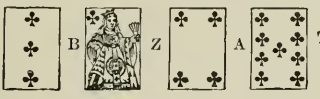
Trick 3. Z leads. Z A Y B Trick 3. Y wins.



Remark.—Z returns his partner's lead (for reasons, see sect. 5).

Several inferences might here be drawn as to the position of the remaining clubs—as, for instance, that B has the queen; but as they do not affect the play, they are omitted, for the sake of brevity.

Trick 4. Y leads. Y B Z A Trick 4. B wins.



Remark.—Y continues his suit (for reasons, see sect. 1).

Trick 5. B leads. B Z A Y Trick 5. A wins.

Inferences.—Spades may be taken to be B's strongest suit. B leads his fourth-best spade, in preference to his lowest. The reasons for preferring this card (an American lead) are too long for insertion here. They must be sought for in exhaustive treatises.

Z, putting on queen second hand, probably has king (see sect. 9). Also, he may be presumed not to hold the knave, or he would play the lowest of the sequence (see sect. 21).

Trick 6. A leads.  Trick 6. B wins.

Remark.—A continues his suit. As a rule, with second and third best (in this case, queen and knave), one of those should be led; but B having played the nine to the king, in the first trick (refer to trick 1, and last inference therefrom), A would part with strength unnecessarily by leading a high card, as B either has the ten or will trump.

This is an example of departure from rule owing to previous fall of cards.

Trick 7. B leads. Trick 7. Z wins.

Remark.—B continues his suit.

Inference.—The ten falling from Y's hand, it may be inferred that he holds no more (see remark, trick 8).

Trick 8. Z leads.  Trick 8. Y wins.

Remarks.—As regards the lead of the spade here, it may seem at the first glance to be contrary to the rules of play advocated in the preceding article. It is a return of the adversary's lead, and up to the strong hand. But it must be remembered that whist is not a stereotyped game of rule; rules can only be given for the general case, and they have to be departed from more or less frequently as the scheme of the hand becomes developed. Z is bound to play to force his partner in order to make the fifth trick, and so to save the game if Y has an honour. Owing to the American lead of seven of spades (at trick 5), Z can count that B remains with three spades, all higher than the seven (the seven being his fourth best), and therefore that Y has no more spades.

A also can count that Y has no more spades. He trumps with the seven of hearts to prevent Y from winning the trick with a very small trump. As the cards happen to lie A's trump is wasted, but the play must not be judged by the result.

Trick 9. Y leads. Trick 9. A wins.

Remark.—Y leads the thirteenth club.

Inferences.—It is probable, from this lead, that Y has strength in trumps, such as an honour guarded. When a thirteenth card is led before trumps have been played, it generally means that the leader wants his partner to put on his best trump, in order to make trumps separately. It may be, however, that the leader only wants his partner to be led up to if the thirteenth card is trumped by the fourth hand. It is a difficult point in the game for the third hand to know whether to play a high trump on a thirteenth card or to pass it.

A further inference from this trick is that Z is weak in trumps, as he only puts on the five. If he trumps at all, he will most likely trump with his highest. Looking at the fact that if the trump lead comes from A the lead will be presumably up to a weak suit, and also that A has the best diamonds and his partner the remaining spades, A determines to lead a trump. Accordingly,

Trick 10. A leads. Trick 10. B wins.

Remark.—Holding but two of the suit, A leads his best (see sect. 6).

Trick 11. B leads.  Trick 11. Y wins.

Remark.—B returns his partner's lead of trumps. As a rule, partner's trump lead should be returned immediately (see sect. 17); but it does not follow that B is bound to return trumps here, a strengthening trump being led late in the hand. B, however, does well to return the trump in this case, as, on the whole, the best chance for the odd trick is to bring down all the trumps, and to find A with the winning diamonds.

Tricks 12 and 13.—Y (trick 12) leads a diamond (he has only diamonds in hand), and A makes the knave and queen.

A B score the odd trick.

See *Laws and Principles of Whist* (23d ed. 1898), *Whist Developments* (4th ed. 1891), and *Card Games* (1897), by the present writer; Clay's *Short Whist* (1881); Pole's *Philosophy of Whist* (6th ed. 1892) and *Evolution of Whist* (1895); Drayson's *Practical Whist* (5th ed. 1892); Foster's *Whist Manual* (1890); Courtney's *English Whist* (1894); and Buller's *Whist Reference Book* (1899).

Whistler, James Abbott McNeill, painter and etcher, was born at Lowell, Massachusetts, in 1834, a son of Major George Washington Whistler, consulting engineer of the St Petersburg and Moscow Railway (1800-49). He studied for a time at West Point, next came to Paris, worked for two years in the studio of Gleyre, and afterwards settled in London. In 1884 he became a member of the Society of British Artists, of which he was president from 1886 to 1889. In France he received a medal (3d class) at the Salon of 1883, a gold medal at the Exposition of 1889, and was 'Hors Concours' at the Salon in 1892; and he was made Chevalier (1889) and Officer (1891) of the Legion of Honour. In 1889 he was elected a member of the Munich Academy, and received the Cross of the Order of St Michael.

In 1859 he began to exhibit in the Royal Academy, showing 'Two Etchings from Nature,' which were followed in 1860 by five dry-point portraits and etchings of Thames subjects, and an oil-picture of a mother and child 'At the Piano,' which was purchased by John Phillip, R.A. Three years later his 'White Girl' was rejected by the jury of the Paris Salon, but attracted considerable attention in the Salon des Refusés. Since then he has exhibited frequently in the Salon, the Academy, the Grosvenor Gallery, the Society of British Artists, and in 1874 and 1892 he has held exhibitions of his paintings in London.

The finest of his oil-pictures are 'The Artist's Mother—an arrangement in Black and Gray,' shown in the Royal Academy of 1872, awarded a gold medal in the Salon of 1884, and purchased for the Luxembourg Gallery in 1891; the 'Portrait of Thomas Carlyle,' shown in the artist's exhibition of 1874, and purchased by the Glasgow Corporation in 1891; and the 'Portrait of Miss Alexander—Harmony in Gray and Green.' In addition to many other portraits, such as those of Señor Sarasate, Miss Rosa Corder, Irving as Philip II., and Lady Archibald Campbell, he has produced some fascinating figure subjects and views on the

Thames, &c. in oils. He is also a skilful worker in pastels upon tinted paper; while as a purely decorative artist he is known by the 'Peacock Room,' painted in 1877 in Mr Leyland's house at Prince's Gate, London, and by the 'Music Room' in Señor Sarasate's residence in Paris.

As an etcher and dry-pointer Whistler's eminence is even more widely recognised than as a worker in colour. His etchings include 'The French Set,' (13 subjects, Paris, 1858); the 'Thames Set' (16 subjects, London, 1871); the 'First Venice Set' (12 plates, London, 1880); the 'Second Venice Set' (26 plates, 1886). In addition to these series Whistler has executed many admirable single plates, including some splendid portraits in dry-point. The total number of his etchings, as catalogued by Frederick Wedmore in 1886, was 214, and their freedom, spirit, and unerring selection of line entitle him to rank as the chief of living 'painter-etchers.' He has also executed a few lithographs of very varying merit, the *Songs on Stone* (1892) especially illustrating his skill.

In *Fors Clavigera* for July 1877 Ruskin made a most intemperate attack upon the paintings exhibited by Whistler in the Grosvenor Gallery, and next year the artist sued the critic for libel. The trial attracted much attention, and ended in a verdict for the plaintiff of one farthing damages without costs. Whistler retaliated in a pamphlet, 'Whistler *v.* Ruskin: Art and Art Critics,' which, along with his brilliant 'Ten O'Clock' lecture, and various occasional letters upon art and personal subjects, were collected in *The Gentle Art of Making Enemies* (1890; augmented ed. 1892).

Whistler's art is original and individual. He never trusts for effect to attractiveness of subject, to human sentiment or anecdotal interest. The charm of his work lies in its technical qualities, in its skilful combinations of tone and colour, of line and mass; and severely restricting himself in his artistic aims, he attains with singular perfection those which he values and for which he strives.

Whiston, William, mathematical divine, was born at Norton rectory in Leicestershire, 9th December 1667. Educated privately, partly because his father's blindness required his aid, he at length entered Clare College, Cambridge, where he distinguished himself greatly in mathematics, and obtained a fellowship in 1693. He next became chaplain to the Bishop of Norwich, and in 1698 was presented to the living of Lowestoft in Suffolk. His *Theory of the Earth* (1696) brought him a considerable reputation, and in 1703 he was appointed to succeed Newton in the Lucasian professorship at Cambridge. But his theological studies unfortunately led him to regard Arianism as the primitive form of Christianity, and with characteristic honesty he made no secret of his convictions. In 1710 he was expelled from his professorship and the university, and the case against him, if it was conducted deliberately without energy, at least lasted five years. He was preached against and refused communion by the clergy, foremost among whom raged Sacheverell. His *Primitive Christianity Revived* (5 vols. 1711–12) included the famous heretical essay on the Apostolic Constitutions. Whiston spent the remainder of a blameless and busy life in London, usually in straitened circumstances, incessantly employed in writing, in controversy, in scientific crotchets, lectures, and the services of a 'Primitive Christian' congregation he had started in his own house. Though an Arian he was a strong supernaturalist, and could defend causes such as prophecy and miracle—even anointing the sick and touching for the evil. His clerical monogamy —now remembered for Dr Primrose's sake alone— was the least whimsical of his peculiar notions, for his identification of the lost tribes of Israel with the Tartars has since been far surpassed. He died in London, 22d August 1752. Whiston's translation of Josephus (1737) is still printed—a carefully revised edition by the Rev. A. R. Shilleto was published in Bohn's Library in 1890; his Life of Samuel Clarke (1730) deserves to be; and the *Primitive New Testament* (1745) is a unique curiosity. His Memoir (3 vols. 1749–50) conveys a very vivid image of this strange, whimsical, eccentric, but thoroughly honest and conscientious man.

Whitbread, Samuel, born in 1758, a London brewer's son, from Eton passed to Oxford, and in 1790 entered parliament. Under Pitt he was leader of the opposition, and in 1805 headed the attack on Lord Melville. He was an intimate friend of Fox. He protested against the rupture of the peace of Amiens, and on Napoleon's escape from Elba denounced all interference with the French in their choice of a ruler. He died by his own hand when insane, 6th July 1815.

Whitby, a seaport and watering-place in the North Riding of Yorkshire, 54½ miles by rail (by road 45) NNE. of York and 22 NNW. of Scarborough. It stands, looking northward over the German Ocean, at the mouth of the Esk, which here emerges from its wooded dells and forms a wide tidal pool, walled in by jet-veined cliffs of alum shale. A stone bridge (rebuilt 1835), 172 feet long, with a swivel by which vessels are admitted to the inner harbour, connects the two halves of the town. Its older portions on the east side, with steep narrow streets and passages or yards, and red-tiled houses, climb tier upon tier up the cliff, where in decaying beauty stand the ruinous abbey of St Hilda and the ancient parish church of St Mary. St Hilda (614–680) founded in 657 the monastery of Streanshalh for religious of both sexes, which has memories of Cædmon and St John of Beverley, and where in 664 was held the great 'Council of Whitby' (see Vol. IV. p. 173). It was burned by the Danes in 867 (they or their successors changed the name of the place to *Presteby* or *Whyteby*, 'priests' or white town'), but in 1078 was refounded by William de Percy as a Benedictine abbey for monks—the nuns of Scott's *Marmion* are a poetical invention. The stately ruins of the church, which was 300 feet long, are Early English and Decorated in style, and comprise choir, north transept, and part of the nave, the great central tower having fallen in 1830. Between the abbey and the cliff is the parish church, originally Norman, gained from the town by a flight of nearly 200 steps; and on the south side is Whitby Hall, built about 1580 by Sir Francis Cholmley, and restored in 1867. Of modern buildings may be mentioned the town-hall (1788), the museum (1823) on the west pier, and the Saloon (1878), in Queen Anne style, with concert-room, promenade, &c., on the side of the West Cliff, which is surmounted by the fashionable terraces of Hudson, the 'Railway King' (1845). The west and east piers, 300 and 800 yards long, protect the outer harbour; and at the extremity of the former is a lighthouse (1831), 83 feet high, like a Doric column. The lighthouse on the east pier is of a lower altitude. The whale-fishery (1733–1837) belongs to the past, but the shipping is still considerable, consisting now almost entirely of iron steamers trading mainly from the Welsh coal ports to the Black Sea, America, and India. Iron shipbuilding is carried on by one firm, though Captain Cook, who was a 'prentice here, might no longer choose Whitby-built ships as 'the stoutest bottoms' in England for his circumnavigation of the world. The herring and other fisheries are actively prosecuted; but Whitby's specialty is the manufacture of Jet (q.v.)—a manufacture now, however, greatly decayed. Whitby and its

neighbourhood offer a rich field for geological research, and its museum contains a fine collection of fossils obtained in the locality, including large specimens of crocodile and alligator species from the lias formation. Whitby is surrounded by scenery of remarkable variety and beauty. It returned one member of parliament from 1832 till 1885. Pop. (1851) 10,989; (1891) 13,274.

See works by Charlton (1779), Young (1817), F. K. Robinson, *Whitby Glossary* (1876), *Whitby and its Abbey* (1860); Canon Atkinson, *Whitby Chartulary* (1879), and *Memories of Old Whitby* (1894); also Mrs Gaskell's *Sylvia's Lovers* (1863), and Miss Linskill's stories.

Whitby, Daniel, was born at Rushden in Northamptonshire in 1638, studied at Trinity College, Oxford, graduating B.A. in 1657, and was elected fellow of his college in 1664. He became prebendary of Salisbury in 1668, rector of St Edmund's, Salisbury, in 1672, and died there, March 24, 1726. His first writings were a series of hot attacks on popery, but in 1683, unfortunately for his peace, he turned from rending the papists to seeking a basis of union with the Dissenters, and so brought down upon his head the furious wrath of Oxford and his bishop. His book, which was entitled *The Protestant Reconciler*, was publicly burned at Oxford, and his diocesan, Dr Seth Ward, made him sign a strong expression of his repentance for having 'through want of prudence and deference to authority' printed a book containing these false, erroneous, and schismatical principles: (1) that it is not lawful for superiors to impose anything in the worship of God not antecedently necessary; and (2) that the duty of not offending a weak brother is inconsistent with all human rights of making laws concerning indifferent things. In the second part of his *Protestant Reconciler*, published also in 1683, he attempted to smooth down the objections of the Dissenters to re-enter the Church of England. His next important task was *A Paraphrase and Commentary on the New Testament* (2 vols. 1753). In his *Discourse* on Election and Reprobation (1710) he spoke out the Arminianism for which he had exchanged the Calvinism of his training. Dr Clarke's *Scripture Doctrine of the Trinity* converted him to Arianism, and he published Arian tracts and treatises which brought him controversy with Waterland. In this faith he died, 24th March 1726, as we find from his *Last Thoughts* (1727).

Whitchurch, a market-town of Shropshire, on an eminence, 19 miles N. by E. of Shrewsbury by railway. Malting and brewing are carried on. Pop. (1851) 3519; (1891) 4002.

White. See White Pigments.

White, Gilbert, author of the *Natural History of Selborne*, was born at Selborne (q.v.) in Hampshire, on July 18, 1720. Educated at Basingstoke under the Wartons' father, in 1739 he entered Oriel College, Oxford, and in 1744 obtained a fellowship, in 1747 took orders, in 1752 became senior proctor of the university, and in 1758 accepted the sinecure college living of Morton Pinkney, Northamptonshire. Six years before he had retired to his native village, to indulge his taste for literature and natural history; and there he died on June 26, 1793. His charming *Natural History and Antiquities of Selborne*, which has made White an English classic, was projected in 1771, and published in 1789. Probably no book on natural history has been more frequently reprinted. Among its countless editions may be mentioned those of Jesse (1851), Frank Buckland (1875), Bell (1877), R. Jefferies (1887), Burroughs (1895), and Jardine (1897). His MS. journal (6 vols. 1768–89), with letters, poems, and weather report, was found in 1880. See the *Bibliography* by E. A. Martin (1897).

White, Henry Kirke, minor poet, was born son of a butcher at Nottingham, March 21, 1785. At fifteen he was apprenticed to an attorney, and here he gave his leisure hours to study with intemperate zeal. He also became a member of a literary society in Nottingham, and sent contributions to the *Monthly Mirror*. These soon attracted the attention of Mr Hill, its proprietor, and Mr Capel Lofft, on whose recommendation he published in 1803 a small volume of poems, which was received by the critics with a lack of enthusiasm into which his sensitive mind read malignity and hatred. But the book secured him the friendship of the kind-hearted Southey and the evangelical pontiff, the Rev. Charles Simeon, through whose influence a sizarship in St John's College, Cambridge, was procured for him. He gave himself to his studies with a zeal that consumed the energies of a constitution always delicate; consumption rapidly developed, and he sank into the grave, October 19, 1806. Southey edited his *Remains* (2 vols. 1807), with a sympathetic memoir, which does justice to his character, and more than justice to his poetry.

White, Joseph Blanco, was born at Seville, July 11, 1775, descended from an Irish Catholic family settled in Spain. He was ordained a priest in 1799, but ere long lost his faith, and in 1810 made his way to England, where he lived the rest of his life. He was tutor to Lord Holland's son (1815–16), and took orders in the English Church, was made M.A. by diploma of Oxford in 1826, settled as a member of Oriel College, lived as tutor in Whately's family at Dublin (1832–35), but fled to Liverpool when he found it impossible longer to believe in the Trinity or the endowment of doctrines or Articles. He edited at London a monthly Spanish paper, *El Español* (1810–14), and when it stopped was granted a pension of £250 a year from the English government. He died at Liverpool, where he had lived six years, 20th May 1841. He contributed to the *Quarterly* and *Westminster* reviews, edited the short-lived *London Review*, wrote *Letters from Spain* (1822), *Practical and Internal Evidence against Catholicism* (1825), *Poor Man's Preservative against Popery* (1825), and *Second Travels of an Irish Gentleman in Search of a Religion* (2 vols. 1833). His most important work is the posthumous autobiography, edited by J. Hamilton Thom (3 vols. 1845), a remarkable self-revelation of a profoundly religious soul seeking for a certainty that is ever impossible to find. But Blanco White's name lives best in literature by his one immortal sonnet, 'Night and Death,' which first appeared, with a dedication to Coleridge, in the *Bijou* for 1828. A corrected copy made by White in 1838 is printed in the *Life*. A third version was communicated to Mr William Sharp, editor of *Sonnets of the Century*, and is printed, together with the two former, in the *Academy* for September 12, 1891. It shows many interesting variations, and avoids the only faults of the sonnet as usually printed:

> Mysterious Night! when our first parent knew
> Thee by report Divine, and heard thy name,
> Did he not tremble for this goodly frame,
> This glorious canopy of light and blue?
> But through a curtain of translucent dew,
> Bathed in the hues of the great setting flame,
> Hesperus with the Host of Heaven came,
> And lo! Creation broadened to man's view;
> Who could have guessed such darkness lay concealed
> Within thy beams, O Sun? or who divined
> When bud, and flower, and insect lay revealed,
> Thou to such countless worlds hadst made us blind?
> Why should we then shun death with anxious strife?
> If Light conceals so much, wherefore not Life?

White, Richard Grant, Shakespearian scholar, was born in New York, 22d May 1821, and died there, 8th April 1885. He graduated at New York university in 1839, next studied medicine, and then

law, being admitted to the bar in 1845, but was finally drawn towards journalism. For fourteen years he contributed to the New York *Courier and Enquirer*, and during the civil war wrote a remarkable series of letters under the signature of 'A Yankee' for the London *Spectator*. He acted also for about twenty years as chief of the United States revenue marine bureau in the district of New York, resigning only in 1878. His acute criticisms in *Putnam's Magazine* on J. Payne Collier's famous folio MS. emendations of Shakespeare (1852) first revealed that intimate knowledge of Shakespeare which gave so much value to the succeeding books: *Shakespeare's Scholar* (1854), a complete annotated edition (12 vols. Boston, 1857–65), *Essay on the Authorship of the three parts of Henry VI.* (1859), *Memoirs of William Shakespeare* (1865), the 'Riverside Edition' of Shakespeare (3 vols. Cambridge, 1883), and the collected *Studies in Shakespeare* (Boston, 1885). Other works worthy of being named are *Words and their Uses* (New York, 1870), *The American View of the Copyright Question* (1880), *Everyday English* (1881), and *English Without and Within* (1881).

Whitebait, the name by which the fry of the Herring (*Clupea harengus*) and Sprat (*Clupea sprattus*) are known in the market, and when served for the table, especially in London. It was formerly regarded as a distinct species of the family Clupeidæ, and was called by Cuvier and Valenciennes *Rogenia alba*, by Yarrell and several other British naturalists, *Clupea alba*. Its true nature has long been definitely established, and it is by no means difficult to recognise in specimens of whitebait the characteristic specific characters of herring or sprat as the case may be. Whitebait

Whitebait.

fishing in the Thames is carried on chiefly from February to August, and it has been found that in February and March only 5 to 7 per cent. of the fish were herring-fry, 93 to 95 per cent. being young sprats, while in June and July the proportions were reversed, 75 to 87 per cent. being herrings, and the remainder sprats. The length of these little fish is from 1 to 3½ inches. The sprat spawns in the Thames from April to June, and the youngest fry, about two months old, are first taken in June. The smallest herring-fry in Thames whitebait are also about two months old, the larger as much as six months, while the largest sprats are probably nine months old. Whitebait are also taken in the estuary of the Forth between Alloa and Kincardine, and in the estuary of the Exe in Devonshire, but in the latter county such fry are locally known as *britt*. Whitebait are almost always taken in stow-nets or bag-nets, large funnel-shaped nets fixed to the rope by which the fishing-boat is moored. The boat is stationary in the tide-way, the fish are carried by the tide into the open mouth of the net, and collect in the small-meshed blind, or cod-end of the net. The fry of the herring and sprat occur in abundance at the mouths of rivers and in tidal estuaries wherever the adults are numerous in the neighbourhood. Shad-fry (*C. finta* and *alosa*) also sometimes occur with the young of sprats and herrings.

For the table whitebait (the *blanchaille* of English hotel *menus*) are fried with flour or crumbs; they are often laid on a napkin and sprinkled with fine flour and a little salt, rolled about till well covered with flour, and then thrown into a pot of boiling lard, where they remain till they are of a pale straw colour. Londoners resort to Greenwich and Blackwall to enjoy whitebait dinners. Towards the end of the 18th century it became the practice for the cabinet ministers to repair to Greenwich for a whitebait dinner every year before the prorogation of parliament in autumn —a practice revived by the Disraeli government in 1874 after its discontinuance by their predecessors, and since carried on with some intermissions. Some of the corporations of London indulge in a similar annual festivity, and the town-council of Exeter have also an annual dinner of which 'britt' is the characteristic feature.

Whitefield, or Stand, a town of Lancashire, 5½ miles N. of Manchester. Dating from 1826, it has many fine residences, cotton manufactures, and neighbouring collieries. Pop. (1891) 10,781.

Whitefield, George, one of the founders of Methodism, was born in the Bell Inn, Gloucester, 16th December 1714. He was the youngest of a family of six sons and a daughter, and he was but two when his father died. He had his schooling at St Mary de Crypt, Gloucester, next served about eighteen months as a drawer in his mother's public-house, and at eighteen entered as a servitor Pembroke College, Oxford. About three years earlier John and Charles Wesley had laid, in the university of Oxford, the foundations of Methodism (q.v.), and Whitefield ere long became conspicuous even amongst the young enthusiasts for zeal, for the austerity of his asceticism, and for labour too great for his strength among the sick and the prisoners in the gaol. His health gave way, but his native air soon restored him. His devotion and piety attracted the notice of Dr Benson, the bishop of the diocese, who gave him deacon's orders in June 1736. He preached his first sermon in Gloucester Cathedral with striking effect, next took his B.A. degree at Oxford, and preached in Bath, Bristol, London, and elsewhere.

Meanwhile Wesley had been in America establishing missions among the colonists, and in the beginning of 1738 Whitefield joined him in Georgia for a few months, returning to be admitted to priest's orders, and to collect funds for the establishment of an orphanage in Georgia. The religious level of the age was low, and the clergy were themselves supine, slothful, and worldly, hence Whitefield found amongst his brethren the most active opposition. But when the parish pulpits were denied him he preached in the open air, the first time with marvellous effect, on Kingswood Hill near Bristol, where the colliers heard him in thousands, the tears streaming down their grimy cheeks. From this time onwards he spent his life in constant travel and incessant preaching, everywhere moving audiences at his will by his irresistible earnestness and eloquence. Nor was it only the unlettered he could move, but critics so cold as Chesterfield, Bolingbroke, Hume, and Franklin.

About 1741 doctrinal differences on the question of predestination led to his separation from John Wesley—both of them being by this time disowned by the Established Church. Wesley took the Arminian view in the controversy; Whitefield adhered to a rigid Calvinism. After a short alienation the two friends were reconciled, and thenceforward their friendship was unbroken, although their ways led apart. Whitefield's

supporters now built him a large shed at Moorfields —near Wesley's chapel—which being temporary was known as the Tabernacle; and his preaching gathered immense audiences around him. But he had no talent for organisation, and as soon as he went away on his frequent and protracted journeys his supporters began to disperse. Indeed he founded no distinct sect, his converts and adherents after his death either following the lead of the Countess of Huntingdon (q.v.) or joining other denominations, many in Wales becoming amalgamated through the guidance of Howell Harris into the body now known as the Calvinistic Methodists. The Countess of Huntingdon appointed Whitefield her chaplain, and built and endowed many chapels to maintain his Calvinistic doctrines.

Whitefield made no fewer than seven evangelistic visits to America, and the rest of his life was spent in preaching tours through England, Scotland, and Wales. In these he preached more than 18,000 sermons to ten millions of people. One of the most famous of these missionary journeys was that which he made to Scotland in 1741. He went thither on the invitation of Ralph and Ebenezer Erskine; but his notions were too catholic for his friends, who were disgusted when they found him as ready to preach in a parish church as to a seceding congregation, and more ready still to preach in the open air. At Cambuslang, in Lanarkshire, his preaching produced one of the most remarkable revivals of modern times; many thousands were stricken with concern about their souls, and found expression for their excitement in violent physical manifestations. It was on his return from this visit that Whitefield met and married a Welsh widow, Mrs James (November 1741). Southey asserts his marriage was not a happy one, but offers no proof; Cornelius Winter, who knew her more than a year before her death, says 'Whitefield was not happy in his wife . . . Her death set his mind much at liberty.' Whitefield set out for America for the last time in 1769. He was ailing at the beginning of the voyage, he was ill at the end of it, and he died somewhat suddenly not long after his arrival in America at Newburyport, near Boston, 30th September 1770.

Whitefield was above the middle size, and of well-proportioned figure. His eyes were dark blue, but were disfigured by a slight squint. His gestures were natural and effective, but his greatest gift was his marvellous voice, clear, full, and musical—capable of reaching 20,000 men on a hillside. His writings by no means correspond with his fame—indeed nothing he has left behind is more than commonplace. The explanation of his unexampled power over his hearers must be sought in the burning earnestness and reality of his faith, the fluency and strength of his language, and that vehemence and impetuosity of nature characteristic of the orator, as well as in the spiritual deadness of the time and the inherent fitness of his subject to the needs of the human heart.

His collected works—about 75 sermons, journals, and letters—together with the *Memoirs* by Dr Gillies, fill 7 vols. (1771–72). There are also Lives by Robert Philip (1838), Andrews (1864), Harsha (1866), Gledstone (1871 and 1900), but especially the Rev. L. Tyerman (2 vols. 1876). See also the *Life and Times of the Countess of Huntingdon* (2 vols. 1840), and Stevens, *History of the Religious Movement of the 18th Century called Methodism* (New York, 1859–62).

Whitefish (*Coregonus clupeiformis*), the Common Whitefish, is the largest of all the Coregoni or American lake whitefish. It is very highly esteemed for food, ranking, indeed, as one of the finest of table fishes. Its range extends from Lake Champlain to the Arctic Circle. See COREGONUS.

Whitehall, a town of New York, at the head or southern extremity of Lake Champlain, and termination of the Champlain Canal, 78 miles by rail N. by E. of Albany. It has sawmills and a trade in lumber. Pop. 5346.

Whitehaven, a seaport of Cumberland, near the point where the Solway Firth merges in the Irish Sea, 38 miles SW. of Carlisle and 80 NW. of Lancaster. Dating from 1633, it has owed its well-being to great collieries—some of them extending beneath the town and under the sea—and to the wealth of hæmatite iron ore found in the neighbourhood. There are blast-furnaces, iron-shipbuilding yards, iron and brass foundries, and manufactures of coarse linen, sailcloth, ropes, soap, and earthenware. The harbour has a wet-dock of five acres, two piers constructed in 1824–41, and each over 300 yards long, and a lighthouse; and steamers ply to Liverpool, Dublin, Belfast, and Ramsey. Whitehaven was attacked by Paul Jones (q.v.) in 1778, and suffered from a mining subsidence in 1791. It was made a parliamentary borough, returning one member, in 1832. Pop. (1851) 18,916; (1891) 18,044.

Whitehead, CHARLES, greatest poet of the name and the writer of at least one good novel, was born in London in 1804, the son of a prosperous wine-merchant. At first a clerk, he gave himself entirely to the life of letters soon after publishing *The Solitary* (1831), a poem of reflection of real promise. His *Autobiography of Jack Ketch* (1834) showed humour, and led to his being asked by Chapman and Hall to give them a popular humorous book in regular instalments. Fortunately for the world he declined, recommending to the publishers the young Dickens, who thus began the famous *Pickwick Papers*. His novel *Richard Savage* (1842) earned and deserved the praises of Dickens and Rossetti. Other works are the *Cavalier*, a poetic drama; the *Earl of Essex*, a historical romance (1843); *Smiles and Tears*, a collection of essays and stories (1847); and a *Life of Ralcigh* (1854). Whitehead unfortunately fell into intemperance, went out to Melbourne to start afresh in 1857, but again sank, lost his wife, and died miserably in 1862, leaving unfinished the *Spanish Marriage*, a promising poetical drama. See *A Forgotten Genius*, a monograph by H. T. Mackenzie Bell (1884).

Whitehead, PAUL, 'a small poet' in Johnson's phrase, was born a tailor's son in Holborn, February 6, 1710, was apprenticed to a mercer, married a short-lived imbecile with a fortune of £10,000, lay some years in the Fleet for the non-payment of a sum for which he had stood security, became active in politics and as a poetical satirist, was one of the infamous monks of Medmenham Abbey (q.v.), became deputy-treasurer of the Chamber, and died 30th December 1774. The only satires of his that need be named are *State Dunces* (1733), inscribed to Pope, and *Manners* (1739), for which Dodsley was brought before the House of Lords. 'Whitehead, who,' says Johnson, 'hung loose upon society, skulked and escaped.' His writings were collected by Captain E. Thomson in 1777, but Churchill's couplet best preserves his name:

> May I (can worse disgrace of manhood fall?)
> Be born a Whitehead and baptised a Paul.

Whitehead, WILLIAM, Colley Cibber's successor as poet-laureate, was born a baker's son at Cambridge in 1715. He was helped to an education at Winchester and Clare Hall, Cambridge, and was elected fellow of his college in 1742. He made the grand tour as tutor to Lord Jersey's son, and by the family influence became in 1755 secretary and registrar of the Order of the Bath, and in 1757 poet-laureate. He died April 14, 1785. He

wrote tragedies, elegies, comedies, farces, epistles, and all manner of other poems long quite forgotten, and deservedly. His poems were collected in 1754, and in 1774 in two volumes—a third volume, with a memoir by W. Mason, followed in 1788.

White Horse, the name applied to a figure of a horse on a hillside, formed by removing the turf so as to show the underlying chalk. Most of these figures are in Wiltshire, but Berkshire possesses the most famous of them all, that at Uffington, 4 miles SE. of Shrivenham. It measures 355 feet from nose to tail, and 120 from ear to heel; is traditionally supposed to commemorate Alfred the Great's victory of Ashdown (871); is mentioned about the reign of Henry II. as existing prior to 1084; and has been periodically 'scoured'—fourteen times between 1755 and 1857, and then not till 1884. The next most famous White Horse, that on Bratton Hill, near Westbury, is likewise said to commemorate a victory of Alfred's, that of Ethandun (878). It originally measured 100 by 54 feet, but now is 175 by 107, having been recut in 1778 and 1853. Other White Horses are those of Cherhill (1780; 129 × 142 feet), Marlborough (1804; renewed 1873; 62 × 47 feet), Pewsey (1812; 180 × 167 feet), Broad Hinton (1835; 90 × 90 feet), and Wootton Bassett (1864; 86 × 61 feet). Yorkshire has two White Horses, both modern—on Roulston Hill, near Northwaite, and the Hambledon Hills, near Thirsk; and on Mormond Hill, Aberdeenshire, are both a White Horse (18th century; 162 × 126 feet) and a stag (1870; 240 feet long). At Tysoe, Warwickshire, is a Red Horse (1461; 54 × 31 feet); near Weymouth is an equestrian figure of George III.; and similar figures of seeming antiquity are the Giant (180 feet long) on Trendle Hill, near Cerne-Abbas, Dorsetshire; the Long Man (240 × 148 feet) at Wilmington, Sussex, reoutlined in 1874; and the Cross (230 × 340 feet) at Whiteleaf, Bucks.

See the Rev. W. C. Plenderleath, *The White Horses of the West of England* (1885; new ed. 1892); Chambers's *Book of Days*, vol. ii. p. 778; and T. Hughes's *Scouring of the White Horse* (1858).

White Lady, a spectral figure which, according to popular legend, appears in many of the castles of Germany, as at Berlin, Neuhaus in Bohemia, Ansbach, Baireuth, Kleve, Darmstadt, Altenburg, as also in London, Copenhagen, Stockholm, and elsewhere, by night as well as by day, particularly when the death of any member of the family is imminent. She is regarded as the ancestress of the race, shows herself always in snow-white garments, carries a bunch of keys at her side, and sometimes rocks and watches over the children at night when their nurses sleep. The earliest historical instance of this apparition occurred in the 15th century, and is famous under the name of Bertha of Rosenberg (in Bohemia). The White Lady of other princely castles was identified with Bertha, and this was accounted for by the intermarriages of other princely houses with members of the house of Rosenberg. In the Schloss of Berlin she was seen in 1598, 1619, 1667, 1688, and again in 1840, 1850, and 1879. The White Lady of Avenel, in Scott's *Monastery*, is an ineffective imitation. It was long a common belief in the Highlands that many of the chiefs had some kind spirit to watch over the fortunes of their house. Popular tradition has many well-known legends about white ladies, who generally dwell in forts and mountains as enchanted maidens waiting for deliverance. They delight to appear in warm sunshine to poor shepherds or herdboys. They are either combing their long hair, or washing themselves, drying wheat, beating flax, or spinning; they also point out treasures and beg for deliverance, offering as reward flowers, corn, or chaff, which gifts turn in the instant into silver and gold. They wear snow-white, or half white half black garments, and yellow or green shoes. All these and many other traits that appear in individual legends may be traced back to a goddess of German mythology who influences birth and death and presides over the ordering of the household. Still more distinctly the appellation White Lady and the name Bertha point back to the great goddess of nature, who appears under various names, and who, as *Berhta* ('the brilliant'), held her circuit on Twelfth-night and revealed her power. When the legend goes on to say that the Bohemian Bertha of the 15th century promised the workmen of Neuhaus a sweet soup on the completion of building the castle, and that this soup, along with carp, is still given in remembrance of it to the poor on Maundy Thursday, we may be permitted to recognise again the festival dishes consecrated to Berhta, such as fish, oatmeal gruel or dumplings, &c., which it is still customary to eat about the time of Twelfth-night and Christmas in most districts of Germany.

See Minutoli, *Die Weisse Frau* (Berl. 1850), and Schrammen, *Die Schicksals- oder Totenfrau im Haus der Hohenzollern* (Cologne, 1888).

White Lead. See LEAD.

White Leg (also called 'Milk-leg': technically *phlegmasia dolens*), an ailment of women, usually soon after parturition. There is swelling of the leg, hardness, whiteness of the skin, and thrombosis of the large veins.

Whitelocke, BULSTRODE, was born in London 2d August 1605, and educated at Eton, Merchant Taylors' School, and St John's College, Oxford. The son of a judge, he studied at the Middle Temple, sat in the Long Parliament for Great Marlow, and took a half-hearted part on the popular side in the great struggle. In 1648 he was appointed one of the commissioners of the Great Seal. He would take no part in the king's trial, but he accepted a seat in the council of state, and was sent by Cromwell ambassador to Sweden (1653). He declined Cromwell's title of viscount, was nominated by Richard keeper of the Great Seal, but again steered prudently enough through that intricate period to be included in the Act of Oblivion. He died in 1676 at his house at Chilton in Wiltshire. Whitelocke's *Memorials* was first published in 1682 in a mutilated and falsified form, the anonymous editor, according to Wood, being Arthur, Earl of Annesley. A more satisfactory edition was that of 1732. The book is reliable, but Mr Gardiner thinks the earlier part to have been written from memory, and so defective with the inevitable defects of such a method. His *Journal of the Embassy to Sweden* was edited by H. Reeve (1855). See his *Memoirs* by R. H. Whitelocke (1860).

White Mountains, a group belonging to the Appalachians (q.v.), in New Hampshire (q.v.). Mount Washington has a practicable carriage-road and a hotel on its summit, with a powerful electric light.

White Pigments. The most important of these is *white lead*, which not only is very serviceable when used alone as a white colour, but in oil-painting most other colours are mixed with it to give them body. Commercial white lead is frequently mixed with sulphate of baryta (barium sulphate), but manufacturers of white lead object to this being called an adulteration, as the mixture is sold by them as such. Less common adulterations are Gypsum (q.v.), chalk, and china clay. *Flake White* is a pure white lead specially prepared for artists, and keeps its colour better than the kind commonly used by house-painters (see LEAD, and PIGMENTS). *Zinc White*, or oxide of zinc, is

not so much used for artistic work in oil as flake white, but in house-painting it is often coated over a ground of white lead, zinc white not being liable to change by the action of sulphuretted hydrogen. As an oil-colour it wants body, and is a bad dryer. As a water-colour, under the name of Chinese white, it is very useful and permanent. *Baryta White, permanent white*, is the sulphate of baryta, and is best when artificially prepared. This pigment does not change in impure air, but is not much in favour for oil-painting, except to mix for some purposes with white lead, as it renders it less liable to alter in tint. White pigments are numerous, but these three are by far the most important.

White River rises in Arkansas, flows north-east into Missouri, then east, south-east, and south through Arkansas, and empties itself into the Mississippi near the mouth of the Arkansas. It is 800 miles long, and navigable 300 miles.

Whites. See LEUCORRHEA.

White Sea (Russian *Bjeloje More*), a branch of the Arctic Ocean extending into the province of Archangel in the north of Russia. About 100 miles wide between the Kaninskaia and Kola peninsulas, it narrows to less than 50 farther south, widens again and forms three gulfs, the Kandalak Gulf, that of Archangel, into which the Dwina falls, and that into which the Onega falls. The sea-route hither was discovered by Chancellor in 1553; Archangel (q.v.) is the chief emporium on its shores. It is usually frozen from the beginning of September till the end of May; and even during the other months, when navigation is possible, it is not free from floating ice, and heavy fogs are frequent. The area is about 50,000 sq. m. By canals connected with the Dwina, it has direct water communication with the Dnieper and the Volga, and so with the Black Sea and the Caspian.

White Sulphur Springs, a watering-place of West Virginia, 227 miles by rail W. of Richmond. It was at one time the most popular summer-resort in the southern states, lies amid fine mountain scenery, and contains several large hotels.

White Swelling, a disease of the Joints (q.v.), in which the synovial membrane passes into pulpy degeneration.

Whitethroat (*Sylvia cinerea*), a bird of the family Sylviidæ, a summer visitant to the British Isles; plentiful during summer in the greater part of England and in Ireland, but rarer in the north of Scotland, where, however, it is also extending its range, breeding regularly as far north as the Dornoch Firth. It is also common during summer in the south and middle of Europe, and is found even in the north. It places its nest in a low bush, or among a tangled mass of brambles and weeds. Its food consists of insects, berries and other fruit. Its song is not very sweet, but is delivered with great energy, and it seems to vie with other birds in singing, refusing to be outdone. It is very lively and amusing as a cage-bird, and very easily tamed. The whole length of the whitethroat is 5½ inches. Its plumage is brown of various shades; the breast and belly brownish white, tinged with rose-colour in the male. The Lesser Whitethroat (*Sylvia curruca*) is a species of much rarer occurrence, and less extensive in its distribution in the British Isles. Whitethroats belong to the same genus as the Blackcap (q.v.) and the Garden Warbler (*S. hortensis*), which is not uncommon in Britain, and almost rivals the blackcap in the richness of its notes, at the same time being apparently intolerant of rivalry, for it avoids the blackcap's haunts.

Whitethroat (*Sylvia cinerea*).

White Vitriol. See ZINC.

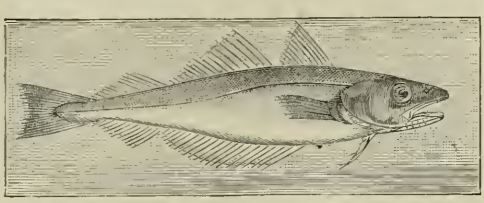
Whitewash, slaked quicklime, reduced to the consistency of milk by means of water. It is used for colouring walls, and as a disinfectant. If merely for colouring, a little size is added, but not when used for sanitary purposes.

Whitgift, JOHN, Archbishop of Canterbury, was born a merchant's son at Great Grimsby, Lincolnshire, in 1530 or 1533. He was brought up at Wellow Abbey, near Grimsby, where his uncle was abbot, and at St Anthony's School in London, and in 1549 entered Queen's College, Cambridge, but migrated next year to Pembroke Hall. In 1555 he was elected a fellow of Peterhouse, and, protected by its master during the Marian persecution, took orders in 1560, and from the Bishop of Ely, to whom he was chaplain, received the Cambridgeshire rectory of Teversham. He became successively Lady Margaret professor of Divinity (1663), Master of Pembroke, a queen's chaplain, a D.D., regius professor of Divinity, and Master of Trinity (1567), Dean of Lincoln (1571), Bishop of Worcester (1577), Archbishop of Canterbury (1583), and a privy-councillor (1586). Several of these offices he held conjointly, for he was a great pluralist. Having attended Queen Elizabeth in her last moments, and crowned James I., he died at Lambeth, 29th February 1604, and was buried at Croydon, where in 1596 he had founded an almshouse. With a decided Calvinistic bias, Whitgift yet was a steadfast champion of conformity, and in his controversy with Thomas Cartwright (q.v.) is held to have vindicated the Anglican position against the Puritans with no less ability than Jewell showed in defending it against the Romanists. Stow, Camden, Wotton, and Fuller concur in their praise of Whitgift, and it was reserved for Macaulay to stigmatise him as 'a sycophant and oppressor.' His works were edited for the Parker Society by the Rev. John Ayre (3 vols. 1851–53).

See vol. ii. of Cooper's *Athenæ Cantabrigienses* (1861) for a bibliography of his ninety-four writings and for a long list of authorities, to which may be added vol. v. of Hook's *Lives of the Archbishops of Canterbury* (1875).

Whithorn, a royal burgh in Wigtownshire, 3¼ miles NW. of the Isle of Whithorn, 12¼ miles S. of Wigtown by rail. Pop. (1851) 1652; (1891) 1403. Ptolemy makes mention of the place as *Leukopibia*, a town of the Novantæ—the name most likely synonymous with the Latin *Candida Casa*, the Old English *Hwit-aern*. Here at any rate St Ninian (q.v.) founded *Candida Casa* or church of Whithorn, dedicating it to St Martin, who had just died (397), and here he was buried in 432. From this place the monastery of Rosnat spread the light far and wide, and here a bishopric was founded by the Angles in 727, which was, however, removed in 796. At length under David I. Fergus, lord of Galloway, re-established the see of Galloway, founding here also a Premonstratensian priory, whose church became the cathedral. In early times pilgrimages were made hither from all parts of Scotland; James IV. came at least once a year, and we find Margaret, queen of James III., visiting it in 1473, and James V. in 1532 and 1533. Here in 1514 died the aged Earl of Angus, 'Bell-the-Cat.' There remains now only a mere, roofless, ivy-grown ruin.

Whiting (*Gadus merlangus*, Linn.), a species of fish of the family Gadidæ. Like the cod, haddock, pout, and poor cod, this species has the upper jaw longer than the lower, but it is distinguished among the species possessing this character by the fact that it has no barbule on the chin. Other specific characters are the pellucid silvery colour of the sides, the presence of a dark mark at the base of the pectoral fin, and the white



Whiting (*Gadus merlangus*).

border of the ventral and dorsal fins. The posterior edge of the tail is straight or but slightly emarginate, the depth of the body moderate; the anus is situated beneath the middle of the dorsal fin. As in all species of Gadus there are three dorsal fins and two ventral. The scales are small. The range of the whiting is the European coast from Scandinavia to the Mediterrancan. It is abundant on British coasts, especially on the south and west coasts of England and Ireland, comparatively rare on the northern coasts of Scotland. It has been recorded as large as 16 inches in length and 3 to 4 lb. in weight, and some specimens are said to have reached 8 lb., but the usual size is about 1 or 2 lb. It is a voracious fish, feeding both on the bottom on crustacea and in midwater on small fish, such as sprats, young pilchards, &c. It also feeds on molluscs and worms, but to a less extent. It is caught both by the trawl and by hand-lines, and in Scotland also by long-lines. In Scotland mussels are chiefly used as bait; in England, pilchard, squid, herring, or mackerel.

The whiting breeds in spring, from March to May; the eggs, as in other Gadidæ, are transparent and buoyant and dispersed separately in the water. It is in high esteem for the table, and is regarded as particularly delicate and easy of digestion. The flesh is of a pearly whiteness, whence the English name. It very soon suffers change, however, and is in good condition only a short time after being caught; but great numbers of small whitings are sent to market, salted and dried, under various names.

Whiting is simply chalk ground and washed to separate impurities. It is extensively used as a size-colour, for cleaning silver and other metals, as well as glass, and in preparing frames for gilding; and (in milk) may be used as an antidote to poisoning by oxalic acid. It is often mixed with white lead as an adulterant.

Whitlow, or Paronychia, is a painful inflammatory affection of the fingers, almost always proceeding to suppuration. There are several varieties of this affection, according to the texture primarily attacked; thus, it may be situated in the skin, the cellular (or connective) tissue beneath the skin or under the nail, the tendons or tendinous sheaths running along the fingers, or the periosteum. If the skin be the seat of inflammation vesicles appear, which soon discharge pus, after which relief is rapidly afforded. Such cases require little care or attention, and give rise to hardly any constitutional disturbance. If the cellular tissue be the primary seat of inflammation there is a painful sensation of tenseness and throbbing of the part, and often considerable febrile disturbance, until the pus can be evacuated. Although this form is painful no serious mischief is to be apprehended. When, however, the tendons and their sheaths, or the periosteum, are affected, a much more serious form of whitlow is developed, which has been already discussed in the article Tendon. In this form the suppuration may extend up the arm and occasion destruction of the joints, and even death.

Whitlow may originate either spontaneously or after an external injury, such as a prick from a needle, thorn, &c. In the treatment of the milder forms the finger or thumb should be held for half an hour or longer in water as hot as can be borne, or enveloped in an antiseptic poultice. When matter shows itself, an incision should be made to admit of its escape. Even if suppuration has not taken place, a free incision into the inflamed part often gives great relief, and much limits the extension of the inflammation.

Whitman, Walt, the unique poetic celebrant of Democracy, the Pindaric laudator of the 'average man,' was born, of mingled English and Dutch stock, on 31st May 1819, at West Hills, Long Island, in New York state, and died on 27th March 1892. Like many another man of genius Whitman seems to have owed little to his formal education, as he left school at the age of twelve to serve first in a lawyer's and then in a doctor's office, and finally in a printer's as an apprentice or learner. But that he profited by such schooling as he had (in the public schools of New York state) is shown by the fact that his next employment was that of itinerant teacher in country schools. He returned shortly to his printing, with spells of summer holiday and even farm-work, and in 1846 became editor of the *Brooklyn Eagle*. This and his other numerous press engagements were only of short duration, a certain restlessness, love of wandering, and eagerness for fresh experiences making him pass rapidly from one post or employment to another. He even built and sold houses at one time, and was in serious peril of growing wealthy on the proceeds, a peril he was zealous and successful in avoiding. All along haunted by the yearning and sense of obligation to produce a life-work, Whitman seemed quite unable to find full and free expressions for his emotions and thoughts until he hit upon the curious, irregular, recitative measures in which he composed the *Leaves of Grass*. When first issued in 1855 this unique publication was but a small quarto of 94 pages, but it grew in the course of the seven succeeding editions till it contained nearly 400 pages. The later and complete editions, taken together with his prose book *Specimen Days and Collect*, may be held to embrace the life-work of Whitman as a writer. But Whitman least of all men was content with an idle and remote spectatorship of life; he was ever bold and determined to face and grapple with life's saddest and sternest realities, to put the full strength of his shoulder to the burden of his fellows. Thus it came that summoned to tend his own brother, wounded in the war against the South, he became the brother-nurse to every wounded or sick mother's son in the Northern army. Not Florence Nightingale's self could be more tender and more beloved than the stalwart, bearded Walt, passing like a broad sunbeam from bedside to bedside in the long hospital wards, with cheery words and helpful offices to the living and last hand-clasp and brotherly kiss to dying comrades. The exertion, the exposure, and the high nervous and emotional strain Whitman underwent in these few years left him a shattered and almost aged man. About the close of the war he received (the magnificent reward of devotion and genius) a subordinate clerkship under government, and was summarily dismissed by Secretary

Harlan as the author of 'an indecent book;' though he fortunately obtained a similar post almost immediately. In 1874 he left Washington for Camden, New Jersey, where he lived till his death. Partially paralysed as he now was, Whitman was in no small danger of falling into absolute poverty, had it not been for the timely help of his admirers beyond the Atlantic, a movement in which Tennyson, Carlyle, and Ruskin and other leading authors took generous and active part. Later on several wealthy American citizens honoured themselves and their country by liberally providing for the aged poet's simple wants.

All the auspices seem in favour of Whitman's immortality: the neglect of his own countrymen, tempered only by ridicule, abuse, and even persecution; the recognition by a few of the leading minds of Europe and America; his slow emergence into acceptance and appreciation if not into popularity; all these seem auguries of a true man of genius. Although Whitman, like Carlyle and Browning, may be a dangerous and dangerously easy model for disciples to imitate, he undoubtedly worked out for himself a style of distinction as notable as theirs. This in itself is a title to fame, or at least a charm against oblivion, even though his style, like that of Lyly, runs to extremes and vices. This style or form is a sort of rhythmic recitative or irregular chant, the precursors of which may be found in the English translation of the Psalms and other Biblical poems, in Macpherson's *Ossian*, and in the later poems of William Blake. These chants vary in movement, and seem governed by laws rhythmic rather than metric, which (like the grammar of an unwritten tongue) have never been formulated even by the inventor himself. They have a peculiar, wild, stirring charm, which is apt to make regular verses seem tame and insipid after them. As to subject, Whitman set himself the Atlantean task of uplifting into the sphere or dominion of poetry the whole of modern life and man, omitting nothing, concealing nothing. Like Wordsworth, he would sing 'man as man,' only with a far wider and bolder sweep of subject and greater daring of treatment. His thesis is that of St Peter's vision; 'there is nothing common or unclean.' Hence the logical necessity with Whitman to include the treatment of subjects which in modern society were tabooed as obscene and unmentionable; hence too the accusations of indecency, so just and pertinent from the accuser's point of view, so futile and irrelevant from that of the accused. Whitman is in fact an idealist who has bound himself by a solemn vow to be a thorough-going realist; and it is his resolute and often successful endeavour to secure this union that gives his work its exceptional artistic quality. He is a prince of impressionists in literature. But so high and hard is the task Whitman sets himself that it is no matter of surprise that he sometimes, if not often, fails, and from heights where he was approaching the sublime falls perilously near the ridiculous. It is the fate of all artists who strive for the highest things that their failures—often only apparent—are more easily detected than their solid achievements; hence the contumely and ridicule that a Turner or a Wordsworth, Keats, or Landor, or Shelley suffers at the hands of a clever but uninitiated criticism. So largely with Whitman; but it is better to approach him in the same spirit that he has shown toward man and nature, that of for ever seeking for what is great and good, while outfacing steadily and bravely every stern and refractory reality.

Whitman's *Leaves of Grass* fell still-born from the press, but in England, of some copies sold in 1865 by a book-pedlar at Sunderland, one was given to W. Bell Scott, who in turn sent one to W. M. Rossetti (see *Athenæum* for 9th April 1892). A selection from Whitman was published by Mr Rossetti in 1868 (new ed. 1886); another in 1886 by E. Rhys; another, *Autobiographia*, by A. Stedman (1892). See W. D. O'Connor, *The Good Grey Poet* (1866); and books by J. Burroughs (1866 and 1897), Dr Bucke (1883), W. Clarke (1892), and J. A. Symonds (1893).

Whitney, Eli, American inventor, was born at Westborough, Massachusetts, December 8, 1765, and was educated at Yale College, where he paid his expenses partly by school-teaching, partly by mechanical labour. Having graduated in 1792, he went to Georgia as a teacher, but finding a generous patron in the widow of General Greene, of the Revolutionary army, he resided on her estate and studied law. The cotton culture at this period, especially that of the best kind, the 'green seed,' was limited by the slow and difficult work of separating the cotton from the seed by hand. Whitney set to work to remedy this under great disadvantages, for he had to make his own tools; but the reports of his success prompted some lawless people to break into his workshop and steal his machine, and get others made before he could secure a patent. He, however, formed a partnership with one Miller in 1793, and went to Connecticut to manufacture cotton gins; but the lawsuits in defence of his rights carried off all his profits and $50,000 voted him by the state of South Carolina. Finally in 1798 he got a government contract for the manufacture of firearms, and was the first to effect the division of labour by which each part was made separately. He made a fortune by this manufacture, carried out with ingenious machinery at Whitneyville, Connecticut; while he had but barren honour from the gin, one of the most important of the whole series of inventions connected with the cotton manufacture. He died at New Haven, January 8, 1825. See Cotton, p. 510.

Whitney, Josiah Dwight, geologist, was born in Northampton, Massachusetts, 23d November 1819, graduated at Yale in 1839, and the year after joined the survey of New Hampshire. The years 1842–47 he spent in study in Europe, returning to explore, together with J. W. Foster, the Lake Superior region. Their *Synopsis* of the explorations was published in 1849; their *Report* on the geology, 1850–51. Whitney next spent two years travelling in the states east of the Mississippi, of which the fruit was *The Metallic Wealth of the United States* (1854). Appointed state chemist and professor in the Iowa state university in 1855, together with James Hall, he issued the *Reports* on its geological survey (1858–59); and in 1858–60 took part in the survey of the lead region of the upper Missouri, publishing, again with Hall, his *Report* (1862). He was appointed state geologist of California in 1860, and laboured on the survey of that state till 1874, publishing in six volumes his *Geological Survey of California* (1864–70). In 1865 he was appointed to the chair of Geology at Harvard, received the LL.D. degree from Yale in 1870, and had the honour of giving his name to the highest mountain in the United States. His *Yosemite Guidebook* was published in 1869. He died in August 1896.—His brother, William Dwight Whitney, philologist, was born in Northampton, Massachusetts, 9th February 1827, graduated at Williams in 1845, and was three years thereafter clerk in a bank, studying Sanskrit the while. In 1849–50 he studied at Yale, then went to Germany, studying at Berlin under Bopp and Weber, and at Tübingen under Roth, with whom he prepared an edition of the *Atharva Veda Sanhita* (Berlin, 1856). In 1854 he was appointed professor of Sanskrit at Yale, in 1870 also of Comparative Philology. He received the degrees of Ph.D. from Breslau (1861), LL.D. from Williams (1868), Harvard (1876), St

Andrews (1874), Edinburgh (1892), and Litt.D. from Columbia (1886). A member of the American Oriental Society from 1849, he was its librarian (1855–73), its corresponding secretary (1857–84), and then its president. His contributions to the *Journal* of the society were no less numerous than important, including a translation of the *Sûrya Siddhânta* (1860); text with notes of the *Atharva Veda Prâtiçâkhya* (1862); the text with notes of the *Taittiriya Prâtiçâkhya* (1871), which was awarded the Bopp prize by the Berlin Academy as the most important Sanskrit publication of the preceding three years; and the Index Verborum to the *Atharva Veda* (1881). He contributed also to the great Sanskrit dictionary of Böhtlingk and Roth (7 vols. St Petersburg, 1853–67). He died 17th June 1894. Professor Whitney was undoubtedly one of the foremost Sanskrit scholars of the day, and was a correspondent of the Berlin, Turin, Rome, and St Petersburg academies, the Institute of France, and a foreign knight of the Prussian order 'Pour le Mérite.' As a scientific philologist he belonged to the school that ascribes the development of speech to the acceptance of conventional signs, its origin imitative rather than an intuitive concomitant of thought. He waged warfare with Max-Müller on fundamental questions of the science of language, and those interested in such controversies will find the European scholar's onslaught on Whitney at length in the fourth volume of his *Chips from a German Workshop* (1875).

Other works of Whitney's are *On Material and Form in Language* (1872); *Darwinism and Language* (1874); *Logical Consistency in Views of Language* (1880); *Mixture in Language* (1881); compendious German *Grammar* (1869), *Reader* (1870), and *Dictionary* (1877); *Oriental and Linguistic Studies* (1873–75); *Life and Growth of Language*, in International Science Series (1876); *Essentials of English Grammar* (1877); *Sanskrit Grammar* (1879); *Practical French Grammar* (1886). He was also editor-in-chief of the great *Century Dictionary* (6 vols. New York, 1889–91).

Whitney, Mount, the highest mountain of the United States outside of Alaska, is in the Sierra Nevada in southern California, and has a height of 14,898 feet.

Whitstable, a long, straggling village in Kent, on the south shore of the Thames estuary, at the mouth of the Swale, 6 miles NNW. of Canterbury. It is famous for the delicacy of its oysters, the large artificial beds being regularly farmed by different companies and proprietors. Pop. of parish, 5000.

Whitsunday. See Pentecost. In Scotland it is one of the usual Terms (q.v.) for regulating the letting of houses and farms—its connection with the Sunday of Whitsuntide or with any Sunday having wholly passed from the popular consciousness. It was formerly movable, but was fixed in 1690 to mean the 15th May. In many respects local usage used to overrule the statute. Thus, in Edinburgh, the term of entry to a house was the 25th May until 1881, when by an act for Scotland it was declared to be the 28th; but rents are payable on the 15th.

Whittier, John Greenleaf, the sweet American 'Quaker poet' and sturdy abolitionist, was born near Haverhill, Massachusetts, on the 17th December 1807, belonging thus to the same golden decade that gave Emerson and Longfellow to America, Tennyson and the Brownings to England. The son of a poor farmer, who was also shoemaker, young Whittier obtained his formal education only with that struggle which seems so much better to foster genius than the possession of all the advantages, as they are called. While the bodily frame that so well served him till his peaceful decease on the 7th of September of 1892 was developed and hardened by his healthy, if arduous, outdoor life, his observation was roused and quickened, his imagination fired and coloured by the shining pages of nature's volume spread out continually before him. He wandered the New England meadows with the voices of Burns and Wordsworth for ever in his ears. He had, too, a notable schoolmaster in Joseph Coffin, an enthusiastic collector of all local legends and antiquities, thus adding to wild nature the weirder interest of strange, dark, and thrilling human deeds and dread-born superstitions. For his technical education, for better or worse, Whittier was apprenticed to journalism, beginning with contributions to the 'Poet's Corner' and as early as 1829 undertaking the editorship of the *American Manufacturer*, and in 1830 that of the *New England Weekly Review*, published at Hartford, Connecticut. His next move was a return to his native town to a similar post on the *Haverhill Gazette* in 1832, after having published in the previous year *Legends of New England* and *Moll Pitcher*. Long before this his poetry had attracted the admiration of William Lloyd Garrison, the champion of 'Abolition,' who rode over from Newburyport to see Whittier when quite a lad, and became his life-long friend. So it fell out that, if Garrison may be called the preacher or prophet, Whittier must be wreathed the poet-laureate of abolition (even though Emerson has touched the subject with more puissant pen). Thenceforward, whether with the bright flashing blade of his noble poetic rhetoric or the sounding quarter-staff of his earnest and manly prose, he fought the long, hot, dangerous battle of emancipation through contempt and defeat to lasting and complete victory. Apart from this strenuous and heroic struggle there is nothing epoch-making in Whittier's life literary or personal. In 1840 he settled in the quiet of Amesbury, a village near his birthplace.

Of Whittier's collected prose works it may be said generally that the historical interest is stronger than the literary; for his prose never rises to the high levels of his poetry, and its main interest lies in the fact that in it we have the work, we may almost say the life-work, of a very earnest and excellent man. The contents of these volumes consist chiefly of articles which have long since served their purpose; and as permanent contributions to literature they lack the masterly style which has in some instances rendered immortal what would otherwise be of but transient interest. Beyond the Atlantic the name abolitionist has never probably obtained the credit that was due to it, mainly because it was hard for an Englishman to realise the high moral and physical courage which the man or the woman must have who passed by that name, not in the slave states merely, but in the North itself, fated though the North was to fight and bleed and conquer in that very cause.

Whittier's claim to immortality lies clearly in his poetry, and there in very small bulk. His anti-slavery poems have for the most part served their purpose, and with some few exceptions, such as the pathetic and spirited 'Slaves of Martinique,' can hardly be of enduring interest. His nature poetry is faithful, fresh, and beautiful, without being quite original, and his ballads of moral heroism, 'Barclay of Ury' and 'Barbara Frietchie,' if a little wanting in pith and sustained force, rank high among poems of that class; but it is when he soars into the spiritual and even mystic spheres, as in 'My Psalm,' that, rising lark-like, his notes come clearest, sweetest, and truest. At lower levels his note is often less certain or even is often ill-sustained. Concerned rather with the feelings and thoughts (neither of them very

remarkable) which he desires to express than with poetic form, he lacks the true enthusiasm of the artist for the *technique* of his work; hence blemishes are often only too patent. Whittier had not, in fact, the quality of originality of the first order nor of that expansiveness which itself becomes the equivalent of originality. No man could be more faithful to his principles, more true to his conscience, and more single in his aspirations towards what was right; no man could cherish through a long life a faith more simple and exalted, or declare with more clearness and insistence his high spiritual message. All these things make a man good and great; they leave him with a lasting influence over kindred minds; but they alone will hardly secure him immortality as a great writer or cause him to take rank among the real thinkers of his age. What will longest remain to us will be the record of a long, pure, and blameless life, and a few of his poems in which, as by a rare and happy fortune, the outbreathings of a sweet and exalted spirit have come to us in a form as exalted and as sweet.

An edition of the poems appeared in 7 vols. in 1888-89; another, containing the posthumous *At Sundown*, in 1894; the Cambridge edition (1894) was reissued in England in 1899. See Lives by Underwood (1875; new ed. 1883), Kennedy (1882), W. J. Linton (1893), and Pickard (1894).

Whittington, Richard, the apprentice's model, is supposed to have been born about 1358, youngest son of Sir William Whittington of Pauntley in Gloucestershire. His father dying, Richard set out for London at thirteen to push his fortune, and apprenticed himself to Sir John Fitz-Warren, a prosperous mercer, whose daughter he afterwards married. We find him a member of the Mercer's Company in 1392, the year after an alderman and sheriff. In 1397 he was chosen Mayor of London to fill the place of Adam Bamme who had died in his year of office, again in 1406, member of parliament for the city in 1416, and in 1419 for the third time mayor. He was knighted by Henry V., and died in the spring of 1423, and by his will rebuilt Newgate and St Michael's Church, connecting also a college and an almshouse with it, while he also restored St Bartholomew's Hospital, gave a library to Grey Friars, and provided drinking fountains.

See the Rev. Sam. Lysons' *Model Merchant of the Middle Ages* (1860), and Besant and Rice's *Sir Richard Whittington* (1881). Mr Lysons defends the famous traditional story of the beginning of Dick Whittington's good-fortune being the lucky sale of the cat he had committed to a friendly sailor to a Moorish king sorely distressed with rats and mice. He refuses to hear of the explanation that he traded with *cats* (three-masted vessels of about 500 tons) and sea-coal. But even if the modern story and the representation of the cat goes back to the 16th century, its historical character is still not proved. And unfortunately the main elements of the story are familiar in German, Italian, Russian, and Danish folklore. But none need doubt the other part of his romantic history, of how when a poor boy aweary of London he had made up his mind to fly, but was arrested on Highgate Hill by a merry peal from Bow Bells which rang to his ears 'Turn again, Whittington, Lord Mayor of London.'

Whittlesey, a market-town of Cambridgeshire, 5½ miles E. by S. of Peterborough. *Whittlesey Mere*, a shallow lake (2 by 1 mile), which formerly existed in the north of Huntingdonshire, 4 miles SW. of Whittlesey, abounded in fish, water-fowl, &c., but is now drained and laid out in cultivation. Pop. (1851) 4972; (1891) 3556.

Whitworth, a town of Lancashire, 3 miles N. by W. of Rochdale, with cotton manufactures and collieries. Pop. 9766.

Whitworth, Sir Joseph (1803–87). See Cannon, Vol. II. p. 714.

Whooper. See Swan.

Whooping-cough. See Hooping-cough.

Whortleberry (*Vaccinium*), a genus of small shrubs, of the natural order Vacciniaceæ, having a four- to five-toothed calyx, a four- to five-cleft bell-shaped or urceolate corolla, with the limb bent back, eight or ten stamens, with two-horned anthers, and a four- to five-celled many-seeded berry. The species are numerous, mostly natives of the northern parts of the world, with evergreen or deciduous, more or less ovate leaves. The Common Whortleberry, or Bilberry (*V. myrtillus*), called in Scotland the *Blaeberry*, is very common in Britain, and in the middle and north of Europe. It is found also in Iceland and in the northern regions of North America. It varies from a few inches to almost 2 feet in height, and has ovate deciduous leaves, and dark purple berries, covered with a mealy bloom. A variety occurs, but rarely, with white berries. The berries are very sweet and agreeable, and are much used for making jelly and tarts; they are also eaten in Devonshire raw with clotted cream. The juice of the berries mixed with the powdered bark of alder and alum is employed by the women of northern Russia to dye their hair bright red. A kind of spirituous liquor is also made from them in Germany. The Bog Whortleberry, or Great Bilberry (*V. uliginosum*), is common in the northern parts of Britain, and in the north of Europe and Asia. It is said to cover extensive tracts in Greenland. It grows in marshy situations, and is a taller plant than the common whortleberry. It has deciduous, obovate, entire leaves, and a fruit larger than the common whortleberry, and inferior to it in flavour. The fruit is said to cause giddiness when eaten in large quantity, and an intoxicating liquor is made from it. The Red Whortleberry (*V. vitis-idæa*) is found on the dry barren moors of Scotland (where it is called Cranberry, q.v.), in northern Europe, and America. The berries, dark red in colour, are acid, somewhat austere, and not so agreeable as the bilberry; yet they make an excellent jelly, which is esteemed for sore throats, and is much used by the Swedes as an accompaniment to venison and other roast meats. Many species of Vaccinium are in occasional cultivation as ornamental shrubs, and the fruit of most of them is agreeable, although in general it wants acidity. Huckleberry, a name of the Gaylussacia shrubs of North America, is sometimes given to the whortleberry, as is also Cowberry.

Whortleberry (*Vaccinium myrtillus*).

Whydah, or Whidah. See Dahomey.

Whydah Bird, or Widow Bird (*Vidua*), a genus of African birds related to the Weavers, having long wings, and a boat-shaped tail, the two middle feathers of the tail of the males excessively lengthened during the breeding season. The name is derived from the country of Whydah in Dahomey, and 'Widow Bird' is a mere corruption of it, which, however, has given to the genus its name Vidua (Lat., 'widow'), regarded as appropriate

because the long tail of the male drops off after the breeding season, and also because of the general dark colour of the plumage. They are frequently brought to Britain as cage-birds, both on account of their plumage and the sweetness of their song. The best-known species (*V. paradisea*) is a small bird, about the size of a canary, with black and brownish-black plumage, with a broad collar of orange-rufous colour, and breast of somewhat similar colour.

Whymper, Edward, wood-engraver and traveller, was born in London, 27th April 1840, the son of an engraver and artist. Trained an artist on wood, he became even more famous for his mountaineering than for his book-illustrations. In 1860–69 he scaled several hitherto unscaled peaks of the Alps, including the Matterhorn (q.v.). In 1867 he made valuable geological discoveries in Northern Greenland, and again in 1872. His memorable travels in the high Andes (including the ascent of Chimborazo and other peaks) took place in 1879–80. See his *Scrambles amongst the Alps* (1871; new ed. 1893); his *Travels amongst the Great Andes of the Equator* (with appendices, 2 vols. 1892); and *Zermatt and the Matterhorn* (1897).

Whyte-Melville, George John, sporting novelist, was born in 1821 at Mount-Melville, near St Andrews, the son of a Fifeshire laird. He was educated at Eton; in 1839 entered the Coldstream Guards; retired in 1849 with the rank of major; but during the Crimean war joined the cavalry of the Turkish contingent (1855–56). From 1850 onwards he published upwards of a score of novels, four or five of them historical, but the best devoted to fox-hunting, steeplechasing, and country-house life generally. He met his death in the hunting-field, in the Vale of Aylesbury, 5th December 1878.

Wiborg. See Viborg.

Wichern. See Rauhes Haus.

Wichita, a city of southern Kansas, capital of Sedgwick county, on the left bank of the Arkansas River, 505 miles by rail W. by S. of St Louis and 228 SW. of Kansas City. It is the meeting-point of four great railway systems, and contains a number of flour and other mills, &c. Wichita was founded in 1870. Pop. (1880) 4911; (1890) 23,853.

Wick, the county town of Caithness, on the Wick River, at its entrance to Wick Bay, 161 miles by rail (1874) NNE. of Inverness. The royal burgh, with its suburbs Louisburgh and Boathaven, lies north of the river, and Pultneytown, a settlement (1808) of the British Fisheries Society, on the south bank. The tidal harbour is a good erection, with accommodation for vessels of light draught and a large fleet of fishing-boats; but a costly attempt to provide larger space with an increased depth of water, by building a new pier and other works farther out in the bay, has been but partially successful. Wick is one of the great centres of the herring-fishery, and to this industry everything is subordinated. Cloth and furniture are also made in some quantity, and there is an extensive distillery and brewery in Pultneytown. Coal and salt are the chief imports, and salt-herrings, oats, and live-stock are exported. The shipping trade is considerable, and steamers call from Orkney, Thurso, Aberdeen, and Leith. There is some fine rock-scenery in the neighbourhood. Pop. (1841) 5522; (1891) 8463.

Wick. See Lamps, Candle.

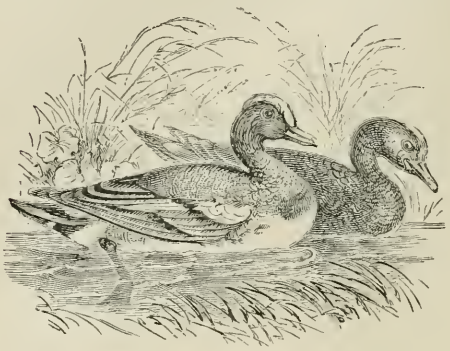
Wicklow, a maritime county of the Irish province of Leinster, borders on Dublin, Carlow, Kildare, and Wexford. Its greatest length is 40 miles, and greatest breadth 33; the total area being 781 sq. m., or 500,178 acres, of which 118,000 are under tillage. The coast-line, in many parts precipitous, is obstructed by sandbanks, and very dangerous for shipping. The surface ascends in some parts most abruptly from the sea, and a large portion is mountainous and unproductive. The Wicklow Mountains form rather a group than a range; the highest point is Lugnaquilla (3039 feet), and the glens which lie between the several mountains or groups are exceedingly picturesque, especially Glendalough, Glendalure, Imail, the Glen of the Downs, and Avoca. The valleys are for the most part of limited extent; but some plains of considerable size lie upon the eastern and southern shores. The lakes, although strikingly beautiful, are few in number and of small size; and the rivers are little more than mountain-streams, except the Liffey and the Slaney, which rise in Wicklow. The great central group of mountains is a mass of granite, which protrudes through mica and clay slate. Lead, copper, sulphur, and iron are raised, with some silver; and gold in small quantities has been found. Slates, limestone, and marl are likewise wrought. In the mountains the soil is thin and poor, but generally dry, although there is a considerable proportion of bog. In the valleys and level districts the subsoil is generally gravel, and the soil is for the most part either dry or, even in the boggy districts, susceptible of drainage. Throughout the greater part of the county the occupations of the people are purely agricultural. The fisheries are almost wholly neglected; and the manufacture of flannels, once extensive, is now nearly extinct. The county is divided into eight baronies. The principal towns are Wicklow, the capital, part of Bray, and Arklow. The county returns two members to parliament. Pop. (1841) 126,162; (1861) 86,479; (1881) 70,386; (1891) 61,934, of whom 49,238 were Roman Catholics. At the invasion the greater part of Wicklow was granted to Maurice Fitzgerald, and Wicklow was included in the shire of Dublin. Generally speaking, however, the authority of the English in Wicklow was little more than nominal, the territory being under the command of the chief of the O'Byrne. A vigorous effort was made by the Lord-deputy, Sir Arthur Chichester, to establish the king's authority in Wicklow, and in 1605 it was erected into a separate county; but again in 1641 the population joined in the general uprising. During the rebellion of 1798 Wicklow was the scene of more than one conflict. Wicklow abounds with antiquities of the highest interest. Many tumuli, raths, cromlechs, and other Celtic remains are preserved; and there are very many ecclesiastical remains of almost every period of Irish Christian architecture; those of Glendalough, which include a round tower, are especially interesting.—The county town, Wicklow, stands at the mouth of the Vartry, 28 miles ESE. of Dublin by rail. As a seaport it has but small trade, and, though it attracts many visitors for sea-bathing, is rather a featureless place. Pop. 3390.

Wicliffe. See Wycliffe.

Widdin, or Vidin, a town of Bulgaria, on the Danube, 20 miles from the Servian frontier. For centuries the 'Virgin Fortress' was a strong Turkish post, and was successfully held by the Turks in 1854 and 1878, as it was by the Bulgarians against the Servians in 1885. See Wm. V. Herbert, *The Chronicles of a Virgin Fortress* (1896). Pop. 15,400.

Widgeon (*Mareca*), a genus of Ducks having the bill shorter than the head, the legs short, the feet rather small, the wings long and pointed, and the tail wedge-shaped. The species are numerous and very widely distributed. The Common Widgeon (*M. penelope*) breeds in the northern

counties of Scotland, and is very abundant during winter in many parts of the British Islands. It feeds chiefly on grass and vegetable matter. The note is a shrill whistle, which has gained for



Widgeon, Male and Female (*Mareca penelope*).

the species its common names of Whew-duck and Whewer. The American Widgeon (*M. americana*), a slightly larger species than the foregoing, is abundant throughout the colder parts of North America. Its flesh, like that of the common widgeon, is highly esteemed for food.

Widnes, a borough of Lancashire, on the Mersey, 13 miles SE. of Liverpool by rail, with iron-foundries, copper-smelting works, and manufactures of soda, soap, candles, manures, &c. Its docks were enlarged in 1884. The population, about 2000 in 1851, had by 1891 increased to 30,011. Widnes, incorporated a borough in 1892, is connected with Runcorn on the other side of the Mersey by a handsome railway bridge.

Widow, by English law, has rights of some importance in her husband's property. She is entitled to dower—i.e. to a life estate in one-third of his lands; the Dower Act of 1833 extends this right to equitable estates, but by the same act great facilities were given for barring the widow's claim, and dower estates are now seldom met with in practice. A widow is also entitled to a share in her husband's personal property not disposed of by will; her share is one-third if there be any child or other descendant of the husband, one-half if there be none. A woman loses her dower by divorce, but not by judicial separation; if she leaves her husband to live with an adulterer, she loses her dower unless the husband takes her back willingly. For the rights of a widow in Scotland, see articles Dead's Part, Husband and Wife, Jointure. In the United States a widow usually takes one-third of her husband's personalty not disposed of, and one-third or more of his real estate, but the laws of the different states vary widely on this point; see Stimson's *American Statute Law*.

Widow Bird. See Whydah Bird.

Wieland, Christoph Martin, a writer who, more in virtue of his tendency and his style than of his actual literary achievements, occupies a prominent place in the history of German literature. The son of a Swabian pastor, and born near Biberach on 5th September 1733, he was brought up in the tenets of pietism and (like young Schiller) conceived an extravagant admiration for Klopstock. These influences, co-operating with a boyish affection, pressed the precocious youth into composing poetry of a deeply religious strain. Bodmer (q.v.), recognising his talent, invited him (1752) to Zurich and inspired him to write *Der geprüfte Abraham* and similar books full of exaggerated sentimentality and religious mysticism. But the native bent of Wieland's disposition was towards the exactly opposite direction, and began to show itself even before he left (1760) Switzerland to take up an official position in his native town. During the next nine years he was chiefly influenced by French writers such as Voltaire and Rousseau and by the society of Count Stadion, a thorough man of the world, and of the beloved of his youth, Sophie von Laroche, now, however, married; in this period, besides making the first German translation of Shakespeare's plays (8 vols. 1762–66), he wrote the romances *Agathon* and *Don Silvio von Rosalva*, *Die Grazien* and other tales, the didactic poem *Musarion*, &c., books in which he advocates taking a full enjoyment of the good things of this life, sometimes in a sense that oversteps the bounds of decent license. The easy and elegant style, the grace and lightness of treatment, and doubtless the strong flavour of the current of French materialism that mark these productions made Wieland the most popular author of his day with fashionable society, who hitherto had read nothing but French literature. After holding for three years a professorship at Erfurt, Wieland was called to Weimar to train the sons of the grand-duchess, and there he spent most of the rest of his life, living on a good pension from the grand-duke and enjoying in his later years the friendship of Goethe and the acquaintance of Herder. He lived to a green old age and died, still hale and cheery of spirit, on 20th January 1813. The chief fruits of his literary activity during this Weimar period were the heroic poem *Oberon*, his best and most popular work, and that by which he is best remembered; the historical romances *Die Abderiten*, *Aristipp*, &c., the elegant satire of which is perhaps their principal charm; the graceful narratives in verse entitled *Auserlesene Gedichte* (1784–87); German versions of Lucian, Horace, and Cicero's *Letters;* and the editing of the magazines *Die Teutsche Merkur* (1773–89), *Attisches Museum* (1796–1801), and *Neues Attische Museum* (1802–10), all of which enjoyed considerable vogue in their day.

Wieland's *Werke* were published in 53 vols. in 1818–28, and in 40 vols. in 1879; editions of *Ausgewählte Werke* in 6 vols. in 1887 and in 6 vols. in 1889. See Life by Gruber (4 vols. 1827–28); books about him by Ofterdinger (1877), Büchner, Keil, Hirzel (1891); and collections of his Correspondence (1815–16, 1818, 1820).

Wieliczka, a small town of Austrian Galicia, 10 miles SE. of Cracow by rail, remarkable for its salt-mines, in which over 1000 of its 6289 inhabitants are employed. For the mines, see Salt. The annual output exceeds 50,000 tons.

Wieniawski, the name of two brothers born at Lublin in Poland, distinguished both as players and as composers. The elder, Henri, violinist (1835–80), studied at Paris, was for twelve years solo-violinist to the czar, and for a time taught at the Conservatoire in Brussels, besides giving concerts in many lands, including America. He left many compositions for the violin.—Joseph, pianist (b. 1837), studied at Paris and Berlin, taught in the Conservatorium at Moscow, held a conductor's post at Warsaw from 1871 till 1877, when he resumed solo playing. Of his compositions for the piano some forty are favourably known to concert-goers.

Wier, Johann, one of the first opponents of the witchcraft superstition, was born in 1516 at Grave in North Brabant, studied medicine at Paris and Orleans, and settled about 1545 as a physician at Arnheim, whence he was called to Dusseldorf to be body-physician to Wilhelm IV., Duke of Jülich, Cleves, and Berg. To him he dedicated his famous treatise, *De præstigiis dæmonum et incanta-*

tionibus ac veneficiis (Basel, 1563), a plea addressed to the duke and all princes against the folly and cruelty of the witchcraft trials. The book pleased Duke Wilhelm, but roused the fury of the clergy. It still stands in the *Index*, but it has given its author a name to be remembered among the benefactors of humanity. The duke protected him till his death on a journey in Secklenburg, 24th February 1588. Wier was a Protestant, and had been a pupil of Cornelius Agrippa, and so his respect for authority was naturally weakened; but it cannot be said that his scepticism is audacious. Still, as Mr Lowell says, he insinuates much more than he positively affirms or denies, and most probably he went as far as he dared, feeling that to go further would damage his case. His famous treatise was followed by *De Lamiis*, and by the *Pseudomonarchia Dæmonum*, a description of the hierarchy of Hell, 'with the names and surnames,' says his indignant antagonist Bodin, 'of seventy-two princes, and of seven million four hundred and five thousand nine hundred and twenty-six devils, errors excepted.' Bodin no doubt felt that the real object was to make the whole thing ridiculous, hence his anger at a writer who 'had armed himself against God' and concocted a tissue of 'horrible blasphemies.' See study by R. Binz (Bonn, 1885).

Wiertz, Anton Joseph, painter, was born at Dinant, 22d February 1806, and studied at Antwerp and Rome. In 1836 he settled in Liége, and in 1848 at Brussels, where he died 18th June 1865. His original artistic ideal was to combine the excellences of Michelangelo and Rubens; and his efforts in this direction are visible in his pictures of 'The Fight of Greeks and Trojans round the Dead Body of Patroclus,' 'The Disobedient Angels,' 'The Death of St Denis,' 'Eve and Satan,' 'The Flight into Egypt,' and 'The Triumph of Christ'—some of them very large canvases. As he could not persuade himself to sell such pictures, he maintained himself now and later by painting portraits. About 1848–50 he developed a new technical method which he called *Peinture Mate;* and now he began to paint totally different subjects—speculative and mystical pieces, dreams and visions, and the horrible outcome of a morbid imagination—premature burial, suicide, madness, execution, sensations after death. There were genre pictures also which were only eccentric—'Quasimodo,' 'The Young Witch;' and even pleasing and kindly pictures—'The Maid at her Toilet,' 'The Confession;' and he also left some sculptures. In 1850 the state had built for him a large studio in Brussels, and at his death this became, by an arrangement between the state and his heirs, the Musée Wiertz, one of the sights of the city. There are monographs by Labarre (1866) and Claessens (1883).

Wiesbaden, chief town of a Prussian district in the province of Hesse-Nassau, was formerly capital of the independent duchy of Nassau. One of the oldest and most famous of the German watering-places, it is delightfully situated on the south slopes of Mount Taunus, and 5 miles NW. of Mainz by rail. The town has been called 'a city of lodging-houses,' and this may be understood from the fact that during the 'season' the number of the visitors is almost as large as that of the resident inhabitants. The principal buildings are the palace (1840); the Kursaal (1810), where the visitors convene, in its delightful park and gardens; the new town-hall (1888); the museum, picture-galleries, and library; the handsome Protestant church (1853–62); the superb Greek chapel (1855), built by the Duke of Nassau as a mausoleum for his duchess; the Catholic church; the synagogue, &c. There are some twenty hot-springs; but the principal is the *Kochbrunnen* ('Boiling-spring'), the temperature of which is 156° F. The spring has all the appearance of a boiling caldron, and so copiously does it pour forth its waters that, though they are used both for drinking and to supply the principal baths in the town, a vast quantity escapes, and runs away through gutters and drains, sending up clouds of vapour in its passage along the streets, and adding to the warmth of the temperature of Wiesbaden in summer. Next in heat and volume to the *Kochbrunnen* is the spring that rises in the garden of the *Adler* ('Eagle') Hotel, the temperature of which is 134° F. The use of the Wiesbaden hot-springs is considered highly efficacious in cases of gout, rheumatism, scrofula, and other skin diseases and nervous affections. The waters of these springs are saline, and contain silica and iron. The prosperity of Wiesbaden is entirely due to its springs; and the beauty of its situation and environment, the agreeable walks and rides, and the never-failing gaiety that prevails during the season render it one of the most popular of the spas. Though the public gaming-tables were abolished in 1872, the number of visitors annually is about 60,000; some 5000 or 6000 strangers winter here annually. Pop. (1871) 35,463; (1890) 64,692. Wiesbaden is very ancient; its springs were known to the Romans, who built a station here and erected a fort. Many Roman remains have been dug up here and in the neighbourhood.

Wiesen, an alpine health-resort for the weak-chested, is 4771 feet above the sea-level, and 12½ miles SW. of Davos by the diligence route to Chur (Coire).

Wife. See Husband and Wife, Marriage, Wedding, Widow.

Wiffen, Benjamin Barron (1794–1867), was born at Woburn, Bedfordshire, of Quaker parentage, and devoted himself to the editing and reprinting of the writings of early Spanish Reformers, his works (1848–69) numbering twenty-nine, and his valuable collections being now in the library of Wadham College, Oxford.—His brother, Jeremiah Holme Wiffen (1792–1836), librarian to the Duke of Bedford at Woburn Abbey, translated Garcilaso de la Vega, Tasso, &c.

Wig, a contracted form of *periwig*, which is a modification (through the Dutch) of *peruke*, from Fr. *perruque;* other Romance forms are *peluca* and *piluca*, and all of them are from Lat. *pilus*, 'a hair.' Wigs were in use from the earliest times, not merely to cover baldness, but, like elaborate coiffures of the natural hair (see Hair-dressing), to add to the dignity or formidableness of savages. Wigs are found on Egyptian mummies, and are indicated in Assyrian sculptures, and passed from Persians, Medes, Lydians, and Carians to Greeks and Romans. But the wig-making and wig-wearing as known to moderns originated in France, and the palmy days of wigs were in the 17th and early 18th centuries. Originally more or less an attempt to reproduce an exceptionally fine head of hair, wigs became in the *allongé perruque* huge masses of hair that, falling down on the shoulders, were parted into two groups or bunches of ringlets, one on each breast. Louis XIV. wore a wig till then of unparalleled size. The English full-dress wig of Queen Anne's time was similar; and this cumbrous type survives in the full-dress full-bottomed wig of English judges, which has flaps of twenty or more rows of stiff and formal curls hanging down in front. The smaller and more ordinary tie-wig (in which the lower part of the wig was tied) is fairly represented by the judge's undress wig and the barrister's or advocate's

frizzed wig. Another form was the bag-wig—the lower part of the wig being tucked into a silken bag on the shoulders. The serjeant's Coif (q.v.) is extinct. When the wearing of wigs was fully established small boys of the well-to-do classes went to school in wigs and cocked-hats. In the early part of George III.'s reign it became more and more usual for private persons to do without wigs, wearing their own hair powdered and tied or looped up like a wig; professional men, especially doctors, stuck longer to them. Just before the French Revolution, which dealt the final death-blow to wig-wearing, a gentleman's wig would cost from 30 to 40 guineas. It should be noted that in France the Catholic Church had resolutely but in vain opposed itself to the introduction of the custom. Bishop Blomfield was the first bishop who set the example of wearing his own hair; Archbishop Sumner still wore a wig at the wedding of the Princess Royal of England in 1858. Professional wigs are now only worn by the Speaker of the House of Commons (a full-bottomed one), judges, and barristers; and a wig is part of the livery of some coachmen. Such wigs are made of white horse-hair, laboriously cleaned, curled, and woven on silk threads, and fitted. Wigs to supply natural deficiency of hair are of course made of human hair. Stage-wigs are often made of jute. A barrister's wig of frizzed hair costs five or six guineas. See FASHION, HAIR-DRESSING.

Wigan, a municipal, parliamentary, and county borough of Lancashire, on the Douglas (a feeder of the Ribble's estuary), 15½ miles S. by E. of Preston, 18½ NE. of Liverpool, and 18 WNW. of Manchester. Situated in the heart of a rich coalfield, and commanding easy communication by both rail and water, it is an ancient place, on the site, it is thought, of a Roman station, but owes its present development to the growth of the cotton industry. The manufactures include calicoes, ginghams, tablecloths, fustians, linen, iron, paper, &c., some of its cotton-mills and ironworks being among the largest in England. All Saints' parish church, a stately edifice dating from the 14th century, was in great measure rebuilt in 1856; and there are also the county buildings (1888), public hall (1853), market-hall (1877), free public library (1878), infirmary (opened by the Prince of Wales, June 4, 1873; enlarged 1884), baths (1882), grammar-school (1619; rebuilt 1876), and a public park (1878) of 27 acres, laid out at a cost of £20,000. A prescriptive borough, whose privileges were confirmed by Henry III., Edward II. and III., Richard II., and Charles II., Wigan returned two members to parliament from Edward VI.'s reign till 1885, when their number was reduced to one. It became a county borough in 1888. Pop. (1831) 20,774; (1881) 48,194; (1891) 55,013. In 1642 Wigan was occupied for the king by the Earl of Derby, but it was twice taken by the parliamentarians; and in 1651 the earl was defeated here by Lilburne. Prince Charles Edward on his southward march passed through the town. Its most eminent native is the apologist Leland. See W. Sinclair's *History of Wigan* (2 vols. 1882).

Wight, THE ISLE OF, with the exception of the Isle of Man the largest island in the English seas, lies off the southern coast of the kingdom, separated from Hampshire by the Solent, a channel mainly ranging between 2 and 4 miles in breadth, but only a mile in width on the west, between Hurst Castle and Cliff End, while it expands to 7 miles between Southsea and the Foreland on the east. In shape Wight is an elongated rhomboid, and the outline has been fancifully likened to that of a turbot. Its extreme length, east to west from the Foreland to the Needles, is about 23 miles, and its extreme breadth, north to south, Cowes to St Catharine's Point, is about 13 miles. The area is calculated at 145 sq. m., or 92,931 acres, but was formerly estimated at much more. A bold range of chalk downs runs somewhat irregularly east and west the entire length of the island, terminating on the west in the fine isolated peaks of the Needles—so well known in the navigation of the Channel, and especially in connection with the port of Southampton—and breaking off on the east at Culver and Bembridge. These downs at several points reach from 500 to 700 feet; but they are excelled in altitude by the high land on the extreme south or 'back' of the island, where St Boniface Down above Ventnor attains 787 feet. This is the highest point of the isle, though St Catharine's Beacon to the westward is only half-a-dozen feet less. The more elevated ground being thus on the south, the chief streams flow to the north, and three of them traverse nearly the whole breadth. Thus the eastern Yar rises on St Catharine's Hill, and falls into a landlocked lake-like estuary at Brading, partially cutting off a peninsular region on the east, known as the Isle of Bembridge. The chief river of the island, the Medina, also rises at St Catharine's, and runs directly northward to the Solent at Cowes. In its course it divides Wight into two fairly equal parts—east and west Medina. Towards the western extremity is another Yar, which rises within a short distance of the southern coast cliffs, and has its embouchure at Yarmouth. This peninsulates a bold district known as the Isle of Freshwater. Smaller streams flow northward to a many-branched tidal inlet at Newtown; and another finds its way through the Wootton Creek between Cowes and Ryde. The streams which flow southward are unimportant so far as size is concerned, and their courses are short, but they play an important part in specialising the characteristics of the island by the formation of 'chines,' narrow ravines worn through the soft rocks by which they pass into the sea—Blackgang the most weird, and Shanklin the most romantic. The geology teems with interest, ranging from the Wealden to the Eocene, and fossiliferous localities of the greatest importance are numerous. The strata form an ascending series generally from south to north. The Wealden beds appear on the south-west coast, chiefly between Atherfield and Compton Bay, where the Wealdens join the Upper and Lower Greensand, Gault, and Chalk, as also at Redcliff Bay near Sandown. The Lower Greensand and Gault extend generally from Atherfield to St Catharine's Point, and from Bonchurch to Sandown. Northward lies the Chalk, chiefly to be noted at Freshwater and Culver. In the remaining portion of the area Oligocene and Eocene beds are finely and characteristically developed. Headon Hill and Alum Bay (long noted likewise for its variegated cliff sands) are the best localities for studying these strata generally, while there are also noteworthy fossiliferous fresh-water deposits, as at Binstead. The flora of the island is rich, especially in chalk and seaside plants; and marine algæ are plentiful.

Wight has long been in repute for the mildness of its climate and the productiveness of its soil; and the former of these features, in conjunction with the picturesque variety and exceeding charm of its landscapes, and the ever-changeful attractions of its romantic coast-line have made it one of the best known of modern seaside centres. It claims some special attention for each of its favourite resorts. Ventnor, best known of all, is delightfully seated in the heart of the singularly beautiful scenery of the rugged Undercliff, a picturesquely broken belt of shifted land between

cliff and sea. Sandown boasts a long stretch of beach, and Freshwater is the centre of the finest rock scenery. But of late years almost every village near the coast has laid itself out for the reception of visitors, and creeks and bays are dotted with hotels. Of ordinary trade there is comparatively little, though there is a fair amount of yacht-building at Cowes, which maintains its position as one of the chief yachting centres of the world. Railways traverse the island between Ryde and Ventnor, with a branch to Bembridge; and there are lines from both Ventnor and Ryde to Newport, and from Newport respectively to Yarmouth and Freshwater, and to Cowes. Ryde has a fine pier. Wight has come the more into favour of recent years from the fact that it was chosen by Queen Victoria as the seat of her marine residence at Osborne. The house, which faces the Solent, eastward of Cowes, was built in 1845. Farringford, near Freshwater, was the favourite residence of Lord Tennyson. Parkhurst Forest, once a royal hunting ground, and of some value as a source of timber for the navy, is now a pleasant tract of woodland, but of little utilitarian importance.

There are yet traces on the downs, in barrows and cairns, of the earlier inhabitants of the island, but its history really begins with its conquest by Vespasian as *Insula Vectis*. From this name of *Vectis* it has been suggested that it may have been the *Iktis* of Diodorus Siculus, to which the British tin was brought in carts at low tide, but apart from other difficulties there is no evidence that the Solent could ever have been fordable in the historic period. There is, however, ample evidence that the island was well appreciated by the Romans. In all probability they had their chief station at Carisbrooke, the central stronghold, and in that village still exist the remains of a small Roman villa. The foundations of a Roman building of much more importance were discovered in 1880 at Morton, near Brading, the pavements of which are remarkably fine. Cerdic is said to have reduced the island in 530; but it did not fall definitely under Saxon rule until later. After the Norman Conquest it was given to William Fitzosborne, but was forfeited by his son, and passed to the Redvers family, who thence took the title of 'lords of the isle.' Baldwin de Redvers, second Earl of Devon, founded there the Cistercian abbey of Quarr, of which a few traces still remain; and in the House of Redvers Wight remained until the death in 1292 of Isabella de Fortibus, *domina insulæ*, when it passed to the crown. Carisbrooke Castle, the most important relic of antiquity in the island, is mainly connected with these Redverses. Norman work may be traced, but the chief portions of the older masonry were executed by the Earls of Devon of this line, one of whom made the famous well, from which water is still raised as of old time by a donkey working in a wheel. The castle was strengthened at the time of the Armada, and it became the prison of Charles I. for some months shortly preceding his execution. In 1650 his younger children were sent hither, and here died the Princess Elizabeth, a monument to whom by Marochetti was placed by the Queen in Newport church. Carisbrooke was the official residence of the governor of the island, which has long been a titular office merely; and it has been for many years a ruin. There are, however, several government establishments, as at Parkhurst, and sundry forts connected with the defences of Portsmouth and Spithead. Before 1832 Wight returned six members to parliament, two for Newport, two for Yarmouth, and two for Newtown, the actual site of which had then no inhabitants. Yarmouth and Newtown were disfranchised, and a county member given to the Isle, which had previously ranked under Hampshire. Now it has no parliamentary borough, and one member for the island only; but it has become an administrative county under the County Councils Act, 1888. The population of the Isle of Wight has more than doubled in the past half century, and is steadily on the increase. In 1891 it was 78,718 as against 73,633 in 1881; and Ryde was the only town which showed a falling off, though it still remained the chief centre, having 10,952 inhabitants against 10,216 for Newport, the other municipal borough. Ryde was closely approached, however, by East and West Cowes, which lie on either side of the embouchure of the Medina, and may fairly be treated as one community, with a joint population of 10,648. Of the other towns Ventnor had a resident population of 5817, St Helens (district) of 4469, Sandown of 3592, and Shanklin of 3277. But these figures are largely increased in the tourist season.

See works by Worsley (1781), Englefield (1816), W. H. D. Adams (1856), Stone (1891), Shore (1892), and Cornish (*Portfolio*, 1895). For map, see PORTSMOUTH.

Wigton, a market-town of Cumberland, in the midst of a specially agricultural district, 11¼ miles by rail SW. of Carlisle. It carries on manufactures of ginghams and winceys. Pop. 3836.

Wigtown, a county forming the south-west corner of Scotland, the western half of Galloway, bounded on the W. by the Irish Channel, N. by Ayrshire, E. by the Stewartry of Kirkcudbright and the Solway Firth, and S. by the Irish Sea. Its length from east to west is 30 miles, its breadth from north to south 28 miles. Area, 327,906 acres; pop. (1851) 43,389; (1891) 36,048. Wigtownshire is deeply intersected by two arms of the sea, the narrow inlet Loch Ryan (q.v.) in its north-western corner, and Luce Bay on the south, 16 miles long, 18¾ wide at its mouth, as measured from the Mull of Galloway on the west—the southernmost extremity of Scotland—to Borough Head on the east. The western peninsula thus formed, known as the *Rhinns of Galloway*, is 28 miles long from Corsewall point in the north to the Mull of Galloway. The south-eastern portion of the county forms a blunt triangular peninsula—the *Machers*—ending in Borough Head, washed on the west by Luce Bay, on the east by Wigtown Bay, 15 miles long and 14 wide at its mouth, separating it from the Stewartry. The rest of the county north of the Machers and east of Loch Ryan bears the general name of the *Moors*, great part being occupied by bleak fells and high mosses. The surface is diversified, but the only hills that reach 1000 feet are on the northern borders—one solitary peak in the Rhinns, Cairn Piot, reaches a height of 593 feet. The chief streams are the Cree and Bladenoch, emptying into Wigtown Bay, the Luce (formed by the junction of the Cross and Main Waters of Luce) and Piltanton, into Luce Bay. The lakes are very numerous, but small—in one parish alone (Inch) there being no fewer than eleven. The climate is mild, but moist. There are neither minerals nor manufactures, the entire industry being agricultural, as much as 46 per cent. of the surface being arable. Excellent farming has made the most of but indifferent soil, and the dairy farms of the county deserve the reputation they have gained. The cows are frequently let for hire to *bowers* or practical dairymen, at from £9 to £12 per head, the farmer supplying all food and the dairyman the labour. Most of the cows are of the Ayrshire breed; the pure native breed of large black hornless cattle are seldom seen, still less the small Galloway pony formerly so popular. The principal towns and villages are Stranraer, Wigtown, Newton-Stewart, Whithorn, Glenluce, Newluce, Cairn Ryan, Portwilliam, Garlieston, Dromore, Portpatrick, and Lochans ~

See W. M'Ilwraith's *Guide to Wigtownshire* (Stranraer, 1876); also the article GALLOWAY, and books enumerated there. For descriptions of the *crannogs* and other lake-dwellings found in Wigtownshire, see Robert Monro in *Ayr and Wigtown Arch. Coll.* (vol. v.), and the Rev. George Wilson in *Proc. Soc. Antiq. Scot.* (vols. ix. and x.). The only ecclesiastical buildings of which ruins remain are the Cistercian abbey of Glenluce (1190) and the old cathedral of Whithorn.

WIGTOWN, the county town, a royal and municipal (and till 1885 parliamentary) burgh and seaport, is situated on the west side of Wigtown Bay, near the mouth of the Bladenoch Water, 7¾ miles S. of Newton-Stewart by rail and 129 SSW. of Edinburgh by road. The only noticeable buildings are the parish church (1853) and the Tudor town-hall (1862–63). In the churchyard are the graves of the famous 'Wigtown martyrs,' an old woman and a young girl who, refusing the Abjuration Oath, were tied to stakes at the mouth of Bladenoch and drowned by the incoming tide, 11th May 1685. An obelisk to their memory also stands on the Windy Hill. An attempt has been made to prove that this atrocious sentence was never executed, as a recommendation to pardon stands in the Privy-council registers, but the fact that the sentence was carried out before this remission was conveyed to Wigtown may be considered to be proved as satisfactorily as any question of its kind can be by the Rev. Dr A. Stewart's *History Vindicated* (2d ed. 1869), in answer to Mark Napier's *Case for the Crown* (1863). Wigtown has a little shipping, and at Bladenoch Bridge there is a distillery. Pop. (1881) 1725; (1891) 1445.

Wigwam. See TENT.

Wilberforce, SAMUEL, was born at Clapham, on September 7, 1805, the third son of William Wilberforce, the anti-slavery philanthropist. Of his father's letters to him after his twelfth year 600 are extant, many of them inculcating the duty and solemnity of private prayer. By his father too he was early taught to express himself clearly upon prescribed subjects. In the 'Union' debating society at Oxford, formed just before he entered Oriel College, aged eighteen, he cultivated this habit, so that in after life eloquence was one of his most marked personal gifts. In 1826 he graduated with first-class honours in mathematics and second-class in classics. On June 11, 1828, he married Miss Emily Sargent, whose younger sister married H. E. (afterwards Cardinal) Manning, and through whom he inherited Lavington in Sussex. On December 21 he was ordained curate in sole charge of Checkendon church, near Henley, and in 1830 became rector of Brightstone, Isle of Wight (Bishop Ken's parish 1667–70). His zeal and his thorough sympathetic mastery of his parochial work there soon made him one of the foremost clergymen in the island, of the north-east of which he became rural dean in 1836, and prepared him for the efficient discharge of the important offices to which he was in rapid succession called. A successful tour in Devon and Cornwall in 1839 on behalf of the S.P.G. brought him into further notice, and the same year he became archdeacon of Surrey. In 1840 he was appointed rector of Alverstoke and canon of Winchester, and an anti-slavery speech so impressed the Prince Consort, who was present, that the following year he was made one of the prince's chaplains and preached at court. Before that, however, the great sorrow of his life had befallen him in the death of his wife. In March 1845 he was appointed Dean of Westminster, and in October, on the eve of Newman's reception into the Church of Rome, Bishop of Oxford. Beginning his episcopate at such a crisis, immersed shortly thereafter in the sea of difficulties raised by the promotion of Dr Hampden to the bishopric of Hereford, distressed by the Gorham judgment, involved in the troubles connected with *Essays and Reviews* and Bishop Colenso, in all which controversies he took an active and prominent part; deeply wounded too by the secession to Rome of his three brothers, his only daughter, and his son-in-law, and by the early death of his eldest son, he nevertheless so governed the diocese for twenty-four years as to deservedly earn the title of the 'Remodeller of the Episcopate.' He has been regarded as the representative member of the bench of bishops, almost of the English Church, during the third quarter of the century, and with him the new order of bishops may be said to begin. Watchfulness and work, not pomp and ease, were his characteristics. His confirmations were made opportunities of lasting impressions, his ordinations seasons of true devotional preparation. He instituted Cuddesdon training-college, and he was mainly instrumental in reviving Convocation as a synodical assembly after it had for nearly 150 years been a mere form. He claimed to belong to the school of the old Church of England, opposed alike to 'Puritan sourness and Romanising superstition.' The charm of his many-sided personality, his administrative capacity, his extraordinary power of work, his social gifts as a ready humorist and a brilliant conversationalist, and his gifts as an orator on the platform and in the pulpit, and as a debater in parliament, are universally acknowledged, but the man has been too much lost sight of in the versatile ecclesiastic, the devout Christian in the popular bishop. 'Too clever, too self-reliant . . . too persuasive, too fascinating in manner, too fertile in expedients . . . too facile,' he got the sobriquet of 'Soapy Sam,' but there was truth as well as wit in his own explanation of the name, that it was because 'he was always in hot water, and always came out of it with clean hands.' The tenderness of his family affection, his life-long devotion to the memory of his wife, and the depth and humility of his inner life are touchingly brought out in his too brief diary. He was neither a great theologian nor a voluminous author, but he edited *Letters and Journals of Henry Martyn* (1837), wrote along with his brother the Life of his father (1838), and himself wrote *Agathos* (1839), *Rocky Island* (1840), *History of American Church* (1844), and contributed to the *Quarterly Review*. In 1869 he was transferred to Winchester, and on 19th July 1873 was suddenly killed by falling from his horse while riding with Earl Granville, near Dorking. He is buried by his wife in Lavington Churchyard, of which his eldest son Reginald Garton became proprietor, his son Ernest Roland being Bishop of Newcastle 1882–95, and then of Chichester, and Albert Basil Orme canon of Winchester.

See *Life* (3 vols. 1879-82; vol. i. by Canon Ashwell, ii. and iii. by his son, R. G. Wilberforce); *Bishop Wilberforce* (1 vol. 1888), by that same son; *Bishop Wilberforce*, by Daniell in the 'English Leaders of Religion' series (1891); and the sketch by Dean Burgon in his *Lives of Twelve Good Men* (1888).

Wilberforce, WILLIAM, abolitionist and philanthropist, was born at Hull on 24th August 1759. His father was a wealthy merchant, descended from an old family, proprietors of Wilberfoss, in the East Riding of York. After a delicate childhood, Wilberforce, at the age of nine, on his father's death, was sent to school at Wimbledon, where, under the care of a pious aunt, he was like to become a Methodist. But his mother did not approve of a serious education, and removed him to a school at Pocklington, Yorkshire, where the religious impressions he had received were soon dissipated by a life of gaiety. His constitution was delicate, but he was quick and spirited, and

fond of society, in which his lively conversation and musical talent made him a great favourite. While at school he addressed a letter to a York paper (1773) 'in condemnation of the odious traffic in human flesh,' the removal of which was afterwards the main object of his life. At seventeen he entered St John's College, Cambridge, and in due time he passed his examinations with credit. He came, on attaining his majority, into possession of a large fortune, and determined to enter parliament. In 1780 he was returned for Hull. He had known Pitt when at Cambridge, made a tour in France with him in 1783, and in London they became inseparable friends. But Wilberforce, in parliament, remained independent of party. The elevation of Pitt to the premiership gave him an opportunity of taking office, but he declined to do so. He rendered, however, efficient service to his friend. In 1784 he was returned to parliament for both Hull and Yorkshire, and took his seat for the county. In 1784–85 Wilberforce made a tour on the Continent with some ladies of his family and Isaac Milner, the Dean of Carlisle, in conversation with whom he became seriously impressed with the truths of the Christian religion, and the rest of his life was leavened with a spirit of earnest piety and devotion. In 1787 he in a great measure eschewed gaiety, and founded an association for the reformation of manners; and in 1788, while in very bad health, he entered on his nineteen years' struggle for the abolition of the slave-trade, to which he thenceforward dedicated his whole time. He was powerfully supported by the Quakers, and by Mr Thomas Clarkson, who kept alive interest in the subject outside the walls of the House of Commons. Pitt, in the absence of Wilberforce through ill-health, introduced the subject to parliament in 1788; in the following year when Wilberforce proposed the abolition of the slave-trade in the House of Commons, he met with powerful opposition, until, after several years of indefatigable labour, the measure for abolition received the royal assent 25th March 1807. Sir Samuel Romilly, who supported the measure, compared the feelings of Napoleon, then at the height of his glory, with those of the English philanthropist, 'who would that day lay his head upon his pillow, and remember that the slave-trade was no more;' and the whole House burst into applause, and greeted Wilberforce with enthusiastic cheers. Wilberforce now sought to secure the abolition of the slave-trade abroad. He at the same time entered on an agitation for the total abolition of slavery itself. Declining health, however, compelled him in 1825 to retire from parliament, in which, since 1812, he had sat for the borough of Bramber. The movement against slavery was then entrusted to Sir T. Fowell Buxton. Three days before Wilberforce's death news was brought him that the Abolition Bill had passed a second reading, and he thanked God he had lived to see his countrymen spend 20 millions sterling in such a cause. He died 29th July 1833, and was buried in Westminster Abbey, where there is a statue of him. Yorkshire erected a county asylum to his memory, and Hull a column. In 1797 Wilberforce married the daughter of Mr J. Spooner, the banker of Birmingham, by whom he had a family of six children. Wilberforce is the author of a *Practical View of Christianity*, which, on its publication in 1797, went through five editions in half a year, and was translated into four European languages. He interested himself in the founding of the *Christian Observer* (1801) and in many schemes for the welfare of the community. He also assisted Hannah More in the founding of her schools at Cheddar. One-fourth of his income went for private charity. He possessed great conversational powers, and was cheerful in disposition, witty and vivacious, a lover of music and flowers. Mackintosh said, 'I never saw one who touched life at so many points.'

See the Life by his sons (5 vols. 1838); and *The Private Papers of William Wilberforce*, edited by A. M. Wilberforce (1897).

Wilbrord. See WILLIBROD.

Wild, JONATHAN, was born about 1682 at Wolverhampton, and apprenticed to a buckle-maker in Birmingham. About 1706 he deserted his wife, and came up to London, where, during a four years' imprisonment for debt, he consorted with criminals. Thereafter he turned a receiver of stolen goods and a betrayer of such thieves as would not share with him, until for theft and receiving he was hanged at Tyburn on 24th May 1725. He forms the theme of Fielding's powerful satire (1743).

Wildbad, a small town of Würtemberg, in the Black Forest, 33 miles SSE. of Carlsruhe, with warm salt baths (from 90° to 98° F.), visited by some 7000 persons annually. Pop. 3514.

Wild Boar. See BOAR.

Wilde, LADY (1826–96), a daughter of Archdeacon Elgee, who in 1851 married Sir W. R. W. Wilde (1799–1869), surgeon and President of the Irish Academy, published *Poems* (1864), *Driftwood from Scandinavia* (1884), *Legends of Ireland* (1886), and *Social Studies* (1893). Sore-tried, she spent her last years in London.

Wilde, OSCAR, born in 1858, the son of Sir W. R. W. Wilde, studied at Magdalen College, Oxford, and in 1878 got the Newdigate prize. In 1881 he published *Poems;* in 1891 *The House of Pomegranates;* in 1893 *Lady Windermere's Fan* (a play); in 1894 *A Woman of No Importance, Intentions,* &c., and *Salome* (from the French); in 1895 a novel, *Dorian Gray.* In 1896 he was condemned to two years' hard labour for vicious practices. In 1898 he published *A Ballad of Reading Gaol.*

Wildebeest. See GNU.

Wildenbruch, ERNST VON, romantic novelist and poet, was born 3d February 1845 at Beyrout, son of the Prussian Consul-General, served in the army, and has held government offices in Berlin.

Wilderness, a wooded region in Virginia, 2 miles S. of the Rapidan, and memorable for the battle between Grant (q.v.) and Lee, May 4–6, 1864—Union loss 18,000, Confederate 11,000.

Wild-fowl. The Act of 1880 specifies as 'wild birds' which may not be shot or killed save between 1st August and the last day of February: American quail, auk, avocet, bee-eater, bittern, bonxie, colin, Cornish chough, coulterneb, cuckoo, curlew, diver, dotterel, dunbird, dunlin, eider duck, fern owl, fulmar, gannet, goatsucker, godwit, goldfinch, grebe, greenshank, guillemot, gull (except black-backed gull), hoopoe, kingfisher, kittiwake, lapwing, lark, loon, mallard, marrot, merganser, murre, night-hawk, night-jar, nightingale, oriole, owl, oxbird, oyster-catcher, peewit, petrel, phalarope, plover, ploverspage, pochard, puffin, purre, razor-bill, redshank, reeve or ruff, roller, sanderling, sandpiper, scout, sea-lark, sea-mew, sea-parrot, sea-swallow, shearwater, sheldrake, shoveller, skua, smew, snipe, solan-goose, spoonbill, stint, stone curlew, stonehatch, summer snipe, tarrock, teal, tern, thick-knee, tystey, whaup, whimbrel, widgeon, wild duck, willock, woodcock, and woodpecker. The term wild-fowl is often limited to waterfowl, which are got at by various special methods, including the gunner's punt, and the decoy. From the decoy-pond several *pipes* covered with hooped network extend in various directions. Wild ducks, widgeon, teal, &c. are induced to enter the wide mouths of the pipes by grain scattered near, by tame decoy-ducks,

and with the help of a trained dog. Once in the pipes, they are easily forced along to the narrow end, where they are readily caught. Sir R. Payne-Gallwey, in *The Book of Duck Decoys* (1886), has collected particulars of 173 English decoys—a number, however, reduced to 39 at the time when he wrote, whilst since the passing of the Ground Game Act (1880) the average annual take in the Berkeley Castle decoys had sunk from 1370 to about 500 head. See also works by the Rev. F. O. Morris (1873) and Leffingwell (Chicago, 1888).

Wild Hunt (Ger. *Wilde Jagd;* also *Wüthenheer*), the name given by the German people to a fancied noise sometimes heard in the air at night, mostly between Christmas and Epiphany, as of a host of spirits rushing along, accompanied by the shouting of huntsmen and the baying of dogs. The root of the notion is doubtless to be found in the Christian degradation of the old heathen gods. Like Woden, the lord of all atmospheric and weather phenomena, and consequently of storms, the Wild Huntsman also appears on horseback, in hat and cloak, accompanied by a train of spirits—by the ghosts of drunkards, suicides, and other malefactors, often without heads, or otherwise mutilated. When he comes to a *cross*-road, he falls, and gets up on the other side. Generally he brings hurt or destruction, especially to any one rash enough to address him or join in the hunting cry, as many persons valiant in their drink have done. Whoever remains standing in the middle of the highway, or steps aside into a tilled field, or throws himself in silence on the earth, escapes the danger. In many districts heroes of the older or of the more modern legends take the place of Odin: thus, in Lusatia, Dietrich of Bern; in Swabia, Berchtold; in Sleswick, King Abel; in Lower Hesse, Charles the Great; in England, King Arthur; in Denmark, King Waldemar. The legend has also in recent times attached itself to individual sportsmen, who, as a punishment for their immoderateness or cruelty in sport, or for hunting on Sunday, were condemned henceforth to follow the chase by night. In Lower Germany there are many such stories current of one Hakkelberend, whose tomb even is shown in several places.

Another version of the Wild Hunt is to be found in the legend prevalent in Thuringia. There the procession, formed partly of children who had died unbaptised, and headed by Frau Holle or Holda, passed yearly through the country on Holy Thursday, and the assembled people waited its arrival, as if a mighty king were approaching. An old man with white hair, the faithful Eckhart, preceded the spirit-host to warn the people out of the way. In one form or other the legend of the Wild Hunt is spread over all German countries, and is found also in France, and even in Spain. In England we meet substantially the same notion in folklore—phantom dogs, like the black Shuck-dog of Norfolk and the Mauthe hound of Peel in Man, the 'Wisht Hounds' of Dartmoor, headless horses, a ghostly coach and horses swept along in a storm of wind. In Shropshire Miss Burne describes 'Wild Edric,' 'Squire Blount' with his coach and four, 'Madam Pigott' with her babe in her arms; Mr Henderson tells us of the 'Seven Whistlers' and the spectral pack called 'Gabriel's Hounds' which may still be seen, and more often heard, in the bleak and lonely moors of the North country. The latter are monstrous human-headed dogs which sweep through the air, and portend death or calamity to the house over which they hang. Mr Yarrell ascribes these weird sounds heard on dark nights to the bean-geese flocking southwards on the approach of winter, and Mr Buckland ascribes the strange rustling, rushing sound often heard in dark still nights of winter to the flight of the redwings. This sound is called the Herring Spear or Herring Piece by the Dover and Folkestone fishermen, who mostly count it as an omen of good success for their fishing, while the cry of the Seven Whistlers again they usually consider as a death omen.

Wilfrid, St, Bishop of York, was born in Northumbria in 634. He was brought up in the monastery of Lindisfarne, but at eighteen visited Rome, returning in 658 a warm partisan of the Roman party in the controversy with the native church on the shape of the tonsure and the time of keeping Easter. At the synod of Whitby (664) he contended against Bishop Colman, and succeeded in gaining over the king, who, learning it was only St Peter to whom the keys had been given, thought it most prudent to be on his side lest Peter should pay him out in his need by closing the gate upon him. Already he had been given the monastery at Ripon, and now he was chosen Bishop of York, being consecrated at Compiègne. On his return he found that Chad had been elected Bishop of Northumbria; but Archbishop Theodore restored Wilfrid. He improved the minster of York, built a splendid church at Hexham, some of the underground portions of which still remain, and raised a new minster at Ripon, the vault of which, called St Wilfrid's Needle, still exists. Theodore, without consulting Wilfrid, divided Northumbria into the sees of Lindisfarne, Hexham, and Whitherne, in addition to York, and Wilfrid made his appeal to Rome. On the journey he was driven by a storm to the coast of Friesland, the inhabitants of which were still pagan. Such was the effect of his preaching that thousands were baptised, and that work of conversion begun which was to be completed by Boniface and Willibrod. Pope Agatho decided in his favour, but King Ecgfrid flung him into prison. He escaped to Sussex, was allowed to return by the new king Aldfrid in 686, keeping the sees of York and Ripon. But again he appealed to Rome against the measures of the new primate, Berthwald (704), and was finally, after a council held near Ripon, allowed to keep Ripon and Hexham, but not York. He died at Oundle in 709, and was buried in Ripon.

The *Vita Wilfridi*, by Eddius, was edited for the Rolls series by Canon Raine, in *Memorials of the Church of York* (vol. i. 1879). See also Dr W. Bright's *Chapters of Early English History* (1878); and *Theodore and Wilfrith*, by Bishop G. F. Browne (1897).

Wilhelmshaven, the chief naval port of Germany, is on the west side of the entrance of the bay or gulf of Jahde, 45 miles NW. of Bremen by rail. The town, first projected in 1856, has been regularly laid out on a strip of ground bought by Prussia from Oldenburg in 1864, and was inaugurated by King William in June 1869. It is now a fortress of the first rank, defended by outlying forts and an elaborate system of torpedoes, and, with its moles, extensive basins, dry-docks, vast stores for the navy, and workshops for all the requirements of a fleet, has been a very costly creation—the massive buildings being erected on soft and swampy ground, without any natural advantage save its situation. Water has been obtained by means of artesian wells. A harbour for commercial purposes has been made to the south of and connected with the naval one; but the mercantile importance of Wilhelmshaven is yet in the future. Pop. 15,000.

Wilhelmshöhe. See Cassel.

Wilken, George Alexander, a distinguished ethnographer, was born, 13th March 1847, at Pomohen in Java, son of a missionary. After his education at Rotterdam, he served eleven years in the Dutch Indian Civil Service, returning home

on furlough in 1880. The year after he became lecturer in the Leyden Municipal Institute. Already in 1884 the university had given him an honorary doctorate, and in 1885 he became its professor of the Geography and Ethnography of the Indian Archipelago. He died at Leyden, 28th August 1891. The essays on Indian ethnology and folklore in the *Indische Gids* and the *Bijdragen van het Koninklijk Instituut* possess a value quite unusual even in such publications. One article, for example, on spirit-worship among the races of the Indian Archipelago, alone extends to 256 pages. Others treat with unexampled fullness of knowledge and clearness of exposition native Dutch Indian theories of relationship and the laws of marriage and inheritance, marriage and betrothal customs, cretinism, the couvade, circumcision, &c. Also on matriarchy among the ancient Arabs he published a solid work in 1884. Vol. i. of a collected edition by Dr Pleyte appeared in 1892.

Wilkes, CHARLES (1798–1877), American naval officer. See TRENT AFFAIR.

Wilkes, JOHN, the second son of Israel Wilkes, a distiller at Clerkenwell, where John was born on 17th October 1727. He was educated first at Hertford under Mr Worsley, and second at Aylesbury under Mr Leeson, who accompanied him to Leyden as his tutor. Charles Townshend and Dowdswell, afterwards Chancellors of the Exchequer, and the Rev. Dr Carlyle were among his fellow-students at Leyden. He travelled through the Netherlands and a part of Germany before returning home. The acquaintances he made abroad were his introducers to fashionable society at home, where he became the boon companion of young profligates. He married to please his parents at the age of twenty-two, his wife being Miss Mead, the daughter of an eminent physician and an heiress. She was ten years his senior, and the union, as he phrased it, was 'a sacrifice to Plutus, not to Venus.' After a daughter had been born to them, the ill-matched pair agreed to live apart. Wilkes was one of a select and disreputable society, the Monks of Medmenham (q.v.), of which Sir Francis Dashwood, afterwards Lord Le Despencer, was the chief, and the Earl of Sandwich was a member. He was intimately acquainted also with some of the best men of the day, William Pitt and Lord Temple being among them. He agreed with Pitt's politics, and aspired to be his follower. An unsuccessful candidate for Berwick-upon-Tweed in 1754, he was returned to parliament for Aylesbury in 1757. Though not then a man of note, he filled positions of honour, being high-sheriff for Buckinghamshire, and first lieutenant-colonel and next colonel of the Bucks Militia. His electoral contests had involved the expenditure of £10,000, and he wished to serve his country in a lucrative office. Lord Bute having declined to appoint him ambassador to Constantinople or governor of Quebec, he vigorously attacked the ministry in the *North Briton* (1762–63), a weekly journal which he had founded. Before the twenty-seventh number appeared he was threatened with prosecution, while he had to atone for unpleasant references to Lord Talbot by fighting a duel with him. In the forty-fifth number some strong but not unjust comments were made upon the king's speech on opening parliament. Lord Halifax, one of the secretaries of state, issued a general warrant for the apprehension of all concerned in the article, which was deemed a libel. The person and papers of Wilkes were seized: after examination before Lords Halifax and Egremont, he was committed a close prisoner to the Tower. Lord Chief-justice Pratt, of the Common Pleas, ordered his release on the ground of privilege as a member of parliament. It was then held and afterwards determined that general warrants were unconstitutional, and that everything done in virtue of one was illegal. He obtained large damages at law for the indignities of which he had been the victim. His resistance and protests made him the hero of the hour; 'Wilkes and Liberty' became the cry of the people. But he had a private press at which some scandalous verses were printed for private circulation, and an inkling of this was obtained from the papers which were seized. The Earl of Sandwich read extracts in the House of Lords from the purloined copy of an 'Essay on Woman,' which was declared to be a most scandalous, obscene, and impious libel. The ministerial majority in the House of Commons expelled Wilkes on 19th January 1764 for being the reputed author of No. 45 of the *North Briton*. Before this he fought a duel with Mr Martin for words at which the latter took offence, and received a bullet in his belly. He was tried and found guilty during his absence from England for printing and publishing the 'Essay on Woman' (1763), of which a copy had never been made public, except by Lord Sandwich in the House of Lords, and he was outlawed for non-appearance. Returning to England in 1768, he became a candidate for the City of London, but failed, while a subsequent attempt to represent the county of Middlesex in parliament ended in his triumphant return. On his appearing before the Court of King's Bench his outlawry was reversed on a purely technical point, and the Lord Chief-justice afterwards sentenced him to twenty-two months' imprisonment and to pay a fine of £1000. While in prison he wrote a preface to a letter of Lord Weymouth in which he charged the secretary of state with instigating the massacre in St George's Fields, and this was declared a seditious libel and made the pretext for his expulsion from parliament. He was re-elected and, after his fourth election, the House of Commons declared him ineligible to sit, and admitted Colonel Luttrell in his stead. These high-handed proceedings against him increased his popularity. In 1771 he was elected sheriff for London and Middlesex; in 1774 he became Lord Mayor, was returned without a contest for Middlesex and re-entered parliament. In 1782 the resolutions invalidating his previous elections were expunged, on his motion, from the journals of the House. He had become chamberlain of the city in 1779; he retired from parliament in 1790, and died on 20th December 1797. His life was agitated and eventful. Since his day general warrants have never been issued, and the privileges of electors have been respected by parliament, while the liberty of the press owes much to him. He wrote pungently. His tastes were literary, and his acquaintance with the classics was wide. He wrote and spoke French with precision and fluency. If he had not been subjected to a persecution which was fomented by the king and conducted by his advisers he would have been less of a martyr and, possibly, of a patriot. Franklin said of him that if his moral character had been equal to that of the king he might have taken the king's place. But though his failings were many, his services to the country were considerable, and, while not one of the great men of his age, he was a far more useful personage than many who stood high in the peerage and in the good graces of George III.

See *Biographies of John Wilkes and William Cobbett*, by Watson; *Historical Gleanings*, by Rogers; *Papers of a Critic*, by Dilke; *Wilkes, Sheridan, Fox: the Opposition under George III.*, by the present writer; and *Life and Times of John Wilkes*, by Fitzgerald.

Wilkesbarre, capital of Luzerne county, Pennsylvania, on the left bank of the north branch of the Susquehanna (here crossed by a bridge), 18

miles by rail SW. of Scranton. The city, which lies in the picturesque Wyoming Valley (q.v.), is famous for its mines of anthracite coal. It contains a large prison, and manufactures locomotives and railroad-cars, mining machinery and tools, iron castings, ropes, pottery, &c. Pop. (1870) 10,174; (1880) 23,339; (1890) 37,718.

Wilkie, Sir David, painter, was born at Cults in Fifeshire, of which parish his father was minister, 18th November 1785. His boyish passion for art was too strong to be resisted by his father, who, with much reluctance, sent him in 1799 to study in the Trustees' Academy at Edinburgh. Here he greatly distinguished himself; and returning home in 1804, he painted his 'Pitlessie Fair,' a piece in which already his peculiar genius is pronounced. Shortly after Wilkie proceeded to London, intending to return to Scotland after a year or two of study; but the great success of his picture 'The Village Politicians,' exhibited at the Royal Academy in 1806, determined him to settle in the metropolis. Next year the 'Blind Fiddler' was produced. In 1809 he was elected an A.R.A., and in 1811 an R.A. In 1814, in company with his friend Haydon, he visited Paris, and inspected with great delight the art-treasures at the Louvre. In 1817 he made a run into Scotland, and, while the guest of Scott at Abbotsford, painted his well-known picture of the great poet and his family. During these years Wilkie had been engaged on the series of pictures on which mainly his fame rests; pictures familiar by engraving to every one ('Card Players,' 'Rent Day,' 'Jew's Harp,' 'Village Festival,' 'Blind Man's Buff,' 'Distraining for Rent,' 'The Penny Wedding,' 'Reading of the Will,' &c.), in which the homely humours of humble life are expressed by a vehicle appropriately simple, and of charming purity and transparency, his style including breadth, skilful technique, and elaborate finish. In this style, distinctively his own, his genius is commonly held to have culminated in 'The Chelsea Pensioners listening to the News of Waterloo,' which was painted during the years 1820–21. This work was a commission from the Duke of Wellington, who paid the artist 1200 guineas for it. Subsequently he changed his style, sought to emulate the depth and richness of colouring of the old masters, and deserting the homely life, which he could treat so exquisitely, chose elevated, and even heroic subjects, to the height of which he could never rightly raise himself. The florid picture, painted in 1830, of 'George IV. entering Holyrood,' which, though not without its fine points, can delight no one but a flunkey, gave the first hint of the change; and no doubt a tour on the Continent, including Italy and Spain, which he made for his health in 1824, did something to stimulate the new and unwise ambition. By common consent it has been adjudged unwise; and Wilkie remains, and will remain, memorable not for the quasi-high art of his later years, but for the simpler and truer art of his earlier time. To his later period belong the 'Princess Doria,' 'The Maid of Saragossa,' 'The Two Spanish Monks,' 'The Preaching of John Knox,' 'Columbus in the Convent,' 'Napoleon and Pius VII.,' and 'Queen Victoria at her First Council.' He also painted portraits in some respects admirable, and was successful as an etcher. He never ceased to be popular, and honours continued to be showered upon him. On the death of Sir Henry Raeburn, he succeeded him as Limner to His Majesty; in 1830 he was made Painter in Ordinary to His Majesty, in room of Sir Thomas Lawrence deceased; and in 1836 the honour of knighthood was conferred upon him. Wilkie had never been robust, and his health now began to give way seriously. In 1840, seeking to re-establish it, he once more left England; but he did not find what he sought. Having visited Syria, Palestine, and Egypt, he died on his voyage home (1st June 1841), off Gibraltar, and his body was committed to the deep.

As an illustrator of Scottish character and manners in humble life, Wilkie in his best pictures may take rank with Burns in poetry, and Scott in fiction. As a man he was kindly, warm-hearted, and of essential generosity of disposition. See the Life by Allan Cunningham (3 vols. 1843), Redgrave's *Century of Painters*, and a short Memoir by J. W. Mollett (1881).

Wilkins, John, Bishop of Chester from 1668 till his death, was born near Daventry in Northamptonshire in 1614, son of an Oxford goldsmith. At thirteen he was admitted at New Inn Hall, whence he shortly removed to Magdalen Hall, graduating B.A. in 1631. As chaplain successively to William, Lord Say, George, Lord Berkeley, and Charles, Count-palatine of the Rhine, he found time for studies in mathematics and mechanical philosophy, and aided in those meetings in London out of which grew the Royal Society. He sided with the parliament, and was appointed Warden of Wadham College. In 1656 he married Robina, widow of Peter French, and sister of Oliver Cromwell, and in 1659 was appointed by Richard Cromwell Master of Trinity College, Cambridge. Dispossessed at the Restoration, he soon recovered court favour and became preacher at Gray's Inn, rector of St Lawrence Jewry, Dean of Ripon, and Bishop of Chester. He died November 19, 1672. As an ecclesiastic he was tolerant and moderate, and indeed looked little better than a trimmer to the zealots, and even the eulogy of that pedantic old Tory, Anthony Wood, is coloured with a characteristic touch of malice—'there was nothing deficient in him but a constant mind and settled principles.' His name now survives only in his curious treatises: *Discovery of a New World* (1638), which gravely discusses the possibility of communication by a flying-machine with the moon and its supposed inhabitants; *Discourse concerning a New Planet* (1640), an argument that our earth is one of the planets; *Mercury, or the Secret and Swift Messenger*, showing how a man may with privacy and speed communicate his thoughts to a friend at any distance; *Mathematical Magic* (1648); *Essay towards a Real Character and a Philosophical Language* (1668), founded on Dalgarno's treatise. His theological writings are forgotten.

Wilkins, Peter. See Paltock.

Wilkinson, Sir John Gardner, Egyptologist, was born at Hardendale in Westmorland, 5th October 1797, had his education at Harrow and Exeter College, Oxford, and in October 1821 set out for Alexandria to devote himself to exploration. Making Cairo his headquarters, he travelled through and investigated almost every part of Egypt and Lower Nubia, twice ascended the Nile as far as the Second Cataract, spent a year at Thebes alone, and visited also the deserts on either side of the river, and the Egyptian oases, making indeed in these twelve years a complete survey of Egypt, and transmitting to the British Museum more than three hundred antiquarian objects. His *Materia Hieroglyphica* (1828), its supplement, devoted to Thebes alone (1830), and his *Topographical Survey of Thebes* (1830) he published during his first stay in the country. Next followed his *Topography of Thebes* (1835), and his famous work, *Manners and Customs of the Ancient Egyptians* (3 vols. 1837), with its complement on the Religion and Agriculture (2 vols. and a vol. of plates, 1841). A new edition of the *Manners and Customs*, uniting both the original series, was

edited by Dr Birch (3 vols. 1879). Wilkinson, who was knighted in 1839, again visited Egypt in 1841 and in 1843, as well as Syria, Constantinople, Tunis, Sicily, Dalmatia, and Montenegro. He paid a fourth visit to Egypt in 1848, a fifth in 1855, presented his collection of coins and antiquities to Harrow, and died 29th October 1875. Wilkinson's other works include books on Dalmatia, travellers' handbooks to modern Egypt, ancient Egyptian architecture, &c., together with the Egyptian notes to Rawlinson's *Herodotus*.

Will is, in English law, a disposition of property, made to take effect at the owner's death, and revocable at any time during his life. Though, by the Wills Act of 1837, a writing is indispensable to a will, yet there is an exception in the case of soldiers or sailors, who, from their occupation, and while in actual service, are allowed to make a verbal or nuncupative will; this exception, however, extends only to their personal estate, for they must make a written will, like other persons, in order to deal with their real estate. An infant, or person under twenty-one years of age, cannot, since 1838, make a will. A married woman can make a will only if she has separate property, or her husband assents to her will, or she makes the will by virtue of some power of appointment vested in her. As a general rule, it is absolutely necessary that the party making a will should have a free and disposing mind at the time; and hence if he or she is a lunatic, or drunk, or acting under compulsion, fear, or undue influence, the will is invalid. There is no limit as to the time preceding death when a will may be made: it is enough that the testator was at the time capable and sensible, though he died immediately after. A will must be executed in presence of two witnesses, who see the testator sign the will, or at least hear him acknowledge it. But there is no particular form of words in which a will must be made for the purpose of disposing either of realty or personalty. The will must be in writing, but it need not be in ink or written continuously. The testator may sign by his mark or by an assumed name. Though a seal is not equivalent to signature, yet a person may have a stamp to sign papers with, and that will be sufficient for a will also. The testator need not sign the will if he authorise some one to do so for him in his presence. The signature must be at the foot or end of the will; but if it is placed so as to lead a court to the conclusion that it was intended to give effect to the will, that will be enough. Though the witnesses need not know it is a will, they must be present together when the testator signs it or acknowledges his signature. The witnesses must sign their names or make their marks. A legatee, or the wife or husband of a legatee, may be an attesting witness, but by being so will forfeit any legacy left by the will. But one may be an executor though he attests the will. A will is revoked by the marriage of the testator or testatrix. The mere fact of making a subsequent will does not of itself operate to revoke a prior will, unless there is some inconsistency in whole or in part; and, as a general rule, no will will be revoked by any presumption of an intention on the ground of an alteration in circumstances. The usual way of revoking a will is to burn, tear, or destroy it with the intention of revoking the same; or to execute another will which expressly revokes the prior will. When a testator tears or cuts away that portion of his will containing the signature and attestations, the presumption is that he intends to revoke the whole. But merely cutting out a part of the will, or striking it through with a pen, does not amount to a revocation. It is to be borne in mind that, in order to revoke by tearing, &c., there must be an intention to revoke, so that a mere accidental tearing will not amount to revocation. When there are interlineations or alterations in a will, it is presumed these are made after signature, unless there is evidence to prove the contrary. A will which is in any manner revoked can only be revived by re-execution, or by a codicil showing an intention to revive it; but many nice questions have arisen as to what causes a will to revive.—In Scotland a will is used only to denote a testament affecting personal or movable property; while a will affecting real or heritable property can only be made by way of a deed having a present operation. A will or testament may be written in the handwriting of the testator, and if signed by him will not require witnesses, being then called a holograph will. In other respects wills are subject to nearly the same rules which prevail in England with respect to revocation &c. Wills of real property are called Dispositions or Deeds, and have a present operation, and the mode in which they are drawn up is that of conveying the property to the disponee, but reserving the testator's liferent. The effect of this is that the testator retains the property in his own hands while he lives; but the moment he dies, the disposition *mortis causa* comes into play, and the disponee then takes the property, subject to the deed (see DEED). In the United States the general principles of the law relating to wills are for the most part of English origin, but the laws of the states vary widely as to the forms required in making a will, &c. In ancient times wills were sometimes enrolled for preservation among the records of a superior or local court, but the episcopal registry in each diocese was the usual place of deposit until by the act which established the Court of Probate in 1857 a principal registry was created at Somerset House, and forty district registries throughout the country. When a will is deposited in a district registry a copy is sent to Somerset House. To the principal registry were transferred the wills deposited in the Prerogative Court of Canterbury since 1383, and those of several other jurisdictions. Any will of a deceased person at Somerset House may be consulted on payment of a fee of one shilling, but readers are not allowed to copy the provisions of a will; official copies may be obtained at a small expense. The will of a living person may be deposited for safe keeping (not, of course, for consultation), but very few testators take advantage of this arrangement. See CODICIL, DEED, EXECUTOR, FORGERY, LEGACY, PROBATE; treatises on wills and will-making by Jarman, Tudor, Theobald, Flood, Davidson; for Scotland, M'Laren; and for the United States, Redfield or Schouler, and Stimson's *American Statute Law*.

Will. Mental phenomena are commonly arranged in the three orders or classes of Cognition, Feeling, and Will. The first includes all the ways in which facts and relations become known; the second refers to the way in which the mind is affected as regards pleasure and pain; to the third, or Will, belong all those mental states in which the mind or subject is regarded as producing changes either in the state of mind itself or in its bodily environment. The movements thus produced are called voluntary, and the mental acts producing them volitions. The term Will may thus be said to refer to the active side of mind. But to make this clear the term 'action' needs limitation. It does not refer to what we know as action in the physical world—e.g. the action of a billiard-cue on the ball: psychologically this process is for us only a certain orderly change of presentations. Further, many of our organic actions and bodily movements are not actions in the psychological sense of the word, seeing that they are not mentally initiated. Spontaneous, Reflex, and Instinctive actions, even

when accompanied by a mental element—sensation or feeling—can be traced solely to certain organic conditions, and do not proceed from a mental initiative: the movement has not been preceded by an idea of the movement. In this way we reach a mark of distinction between the non-voluntary and the voluntary. In volition the movement is preceded by an idea of its 'end;' and this end is further so connected with the emotional nature of the subject that its attainment gives satisfaction or pleasure, and the failure to attain to it is the cause of dissatisfaction or pain. Hence also the mental changes which do not possess these characteristic marks, but are due to the occurrence of new sensations or to the mechanism of association, belong to the class of the non-voluntary.

If, however, in accordance with what has just been said, an act of will be allowed to involve both an ideal element and an element of feeling, it follows that the phenomena of will cannot be marked off as an entirely distinct class from those of cognition and feeling. Elements from these latter classes enter into and go to determine the nature of volition. The question therefore arises whether there is any ultimate volitional element, equally fundamental in consciousness, with the element of presentation in cognition, or of pleasure or pain in feeling. If there is such an element, then we may expect to find it entering into cognitive and emotional states of mind just as presentation and feeling enter into volition. Various attempts have been made by psychologists to account for the phenomena of volition without admitting any will-element as an ultimate constituent of consciousness. Sometimes these theories have been mainly physiological in nature; but as such they go no further than to trace the development of the organic processes which accompany volition. These organic processes themselves, in so far as they enter consciousness at all, only enter it as motor presentations. A psychological account of volition which denies its ultimate character must therefore trace it either to presentation, or to feeling, or to their combination. On the other hand, those psychologists who contend for the ultimate character of the will-element in consciousness need not be satisfied with pointing out the difficulties which opposed theories fall into. They may contend that the will-element is assumed by them at starting along with their conception of presentation and of a complex of presentations. The question is thus apt to fall back upon the still more fundamental question as to whether a presentation *per se* is intelligible. If we may assume that a presentation which is presented to no one, or is the object of no subject, is an impossible beginning for mental development, then with presentations we must assume a subject to which they are presented. It is with the recognition of this assumption of a Subject that we seem to reach the crucial point in the doctrine of will. It is admitted that such cognitive processes as reasoning and perception are also active processes—i.e. that they involve will; and it is contended by some that even in presentation the subject is not to be regarded as entirely passive, but is to be looked upon as reacting upon the presentation in attending to it. Hence those psychologists who hold to the view that there is a will-element in consciousness equally ultimate with the cognitive element and the feeling-element, also frequently look upon Attention as the expression of that element, and upon the 'movements' of attention, or its continuous redistribution over the content of consciousness, as the fundamental act of will. And in this connection it may become apparent that the psychological question runs into and involves a philosophical view of the subjective activity to which simple presentation as well as rational choice is due. From this point of view also we see how will has come to be specially identified with the self or person, so as to admit of its being said that the will *is* the man.

The disputed questions concerning the mode of voluntary action have been generally discussed either as a part of, or in more or less express connection with, the time-honoured controversy concerning the Freedom of the Will. This controversy arose out of ethical and, still more, theological discussions, rather than from purely psychological analysis. The way for the question was opened by Aristotle's investigation of the opposition between the voluntary and involuntary, and by his criticism of the older Socratic position that good only is voluntary and evil involuntary. By the application subsequently of the Stoical doctrine of a universal necessity or fate to the question of human volition a further step was taken towards opening up the controversy which has to so great an extent dominated modern psychology and ethics. Christian theology introduced alongside of the traditional philosophy of Greece a new conception of the relation between God and man, with the attendant conceptions of sin and grace. And from this new conception there soon emerged a twofold drift of thought, according as emphasis was laid on the holiness or on the power of God. From the former point of view it was necessary to free the conception of God from the stain of the evil in the world, and especially in human conduct; and accordingly a certain independence, a power of disobeying the divine law or of sinning, was attributed to the human will. In this way the 'freedom of the will' came to be defended by early Christian writers (e.g. Justin Martyr, Tertullian) against the fatalism which traced both good and evil to God. On the other hand, the conception of the divine omnipotence dominated the Christian philosophy of St Augustine. The Christian doctrine of salvation was made to hinge not on the individual will, but on the divine grace which freely elects to salvation and leads the wills of the elect from sin to repentance, faith, and holiness. This theory of predestination was afterwards more strictly formulated by Calvin, and through his influence became the creed of the Reformed churches. It is noticeable, however, that St Augustine, if not Calvin also, seeks to defend the justice of God by ascribing free-will to Adam, who, as progenitor and representative of the human race, is represented as having lost the power to will the good, and—for himself and his descendants—come under the sway of evil until drawn from it by irresistible grace. The arguments drawn from the theory of predestination for the most part hold with equal force against free-will before or after the fall, and in one of the ablest treatises against the common notion of the Freedom of the Will, that by Jonathan Edwards, the arguments adduced are quite general in their application. The Free-will controversy, as discussed between Augustine and Pelagius, has revived with each new discussion of dogmatic theology; and from theology the metaphysical and psychological questions involved have passed into the schools of philosophy. Thus from Descartes to Lotze there is hardly a great thinker who has not attempted on one side or the other, or by way of compromise, to solve the question. The psychology of the question has been discussed with great fullness by the English and Scottish psychologists. While Reid, Stewart, Hamilton, and H. L. Mansel maintain the doctrine of Free-will, the theory of Necessity—or, as they mostly prefer to call it, Determinism, emphasising thus the observed invariable sequence of act upon motive rather than

any necessary connection between them—is supported by Hobbes, Hume, Priestley, James Mill, J. S. Mill, and Bain. The view of Locke, as expressed in his subtle but intricate chapter on 'Power' in the *Essay*, is that the will, or rather the man, is moved to act by the most pressing uneasiness; and his theory would therefore be called determinist did he not subsequently assert that, in order to prevent precipitate determination, 'we have a power to suspend the prosecution of this or that desire,' and that 'in this seems to consist that which is (as I think, improperly) called *free-will*.'

The clearest view of the whole controversy may perhaps be obtained by passing shortly in review J. S. Mill's discussion of the subject in his *Examination of Sir W. Hamilton's Philosophy*. The meaning of his doctrine is first explained. To begin with, he argues that Determinism does not imply materialism; man may be a spiritual being, but yet subject to the law of causation, 'his volitions not being self-caused, but determined by spiritual antecedents (e.g. desires, association of ideas, &c., all of which are spiritual if the mind is spiritual) in such sort that when the antecedents are the same the volitions will always be the same.' Further, he contends that Determinism does not mean fatalism: neither the pure or Asiatic form of fatalism which holds that our actions do not depend on our desires, but are overruled by a superior power, nor the modified form of fatalism which 'holds that our actions are determined by our will, our will by our desires, and our desires by the joint influence of the motives presented to us and of our individual character, but that, our character having been made for us and not by us, we are not responsible for it, nor for the actions it leads to, and should in vain attempt to alter them.' The 'true doctrine of the causation of human actions' rejects this conclusion, and maintains 'that not only our conduct but our character is in part amenable to our will,' and 'that we can by employing the proper means improve our character.' The 'necessity' involved in human action simply comes to this, that any one who 'knew perfectly our character and our circumstances' could predict our actions.

The arguments for this theory of Determinism may be reduced to two: that from the universality of the connection between cause and effect, and that from the constant presence of motives in volition. The theory of determinism inferred, by Mill and most English psychologists, from these considerations, is that the action is the outcome of motives, the weight or strength of motives being further determined by their pleasure-value—that is to say, from the point of view of feeling alone. It is noticeable, however, that a very different, though still determinist, theory of volition has been elaborated by Herbart. His psychology, in spite of the widely different philosophical principles from which it starts, has many points of similarity with that of the English Associationists; but his treatment of volition differs from theirs by attributing the motive-force which governs action not to pleasure and pain but to presentations themselves, from the interaction of which volition is held to be a special development. Whereas Mill looks upon will as issuing from desire, and desire as a conscious tendency towards pleasure—a view expressed by the old dictum, *nihil appetimus nisi sub specie boni*—the Herbartian psychologists put forward a view of will which disconnects it from the representation of an object as pleasurable.

On the other hand, the arguments for the theory of free-will may also be reduced to two: the argument from the consciousness of freedom, and the moral argument. Regarding the argument from consciousness Mill says that 'to be conscious of free-will must mean to be conscious before I have decided that I am able to decide either way.' And this power he denies on the ground that 'consciousness is not prophetic;' 'consciousness tells me what I do or feel. But what I am *able* to do is not a subject of consciousness.' We may have a conviction afterwards that we could or should have chosen the other course, but only by supposing 'a difference in the antecedents. We picture ourselves as having known something which we did not know, which is a difference in the external inducements, or as having desired something or disliked something more or less than we did, which is a difference in the internal inducements.' The moral argument, so far as it refers to the connection between freedom and responsibility, is also dealt with by Mill. Moral responsibility, he contends, does not imply freedom, for 'responsibility means punishment.' Punishment is a motive to action, and 'proceeds on the assumption that the will is governed by motives.' The consciousness of 'deserving punishment' which is, he adds, bound up with the feeling of responsibility, 'is nothing else than our knowledge that punishment will be just'—i.e. fitted to prevent us from infringing the rights of others. It is on these latter points that Mill's views may most probably seem insufficient. With regard to the consciousness of freedom, so careful an observer as Sidgwick gives a different interpretation of the facts. 'In the case of actions,' he says, 'in which I have a distinct consciousness of choosing between alternatives of conduct, one of which I conceive as right or reasonable, I find it impossible not to think that I can now choose to do what I so conceive, however strong may be my inclination to act unreasonably, and however uniformly I may have yielded to such inclinations in the past. This belief seems to me bound up with the belief that I *ought*, in the strictest sense, to choose any course.' And Mill's explanation of responsibility, and of the connected notion of moral obligation, is not so much a justification of these notions as the construction of a new meaning for the old words which may serve all social requirements. The ordinary notion of moral responsibility seems to involve the recognition of a law as binding on conduct, or of an ideal which ought to be realised in it: even apart from consideration of the punishment which may follow a breach of the law or disregard of the ideal.

The ethical aspect of the question of free-will thus becomes apparent. It is most pronounced in the system of Kant, in which the free will comes to be identified with the moral law itself. On the other hand, Sidgwick maintains that, while the ordinary notions of moral obligation and moral responsibility imply the conception of free-will, the content of morality is independent of it, that no decision on the question is required before deciding what it is right or reasonable to do in any circumstances, and that the freedom of the will is therefore not a necessary postulate of ethical theory. Some idea of the different ways in which the question of free-will enters into a philosophical construction of things, and of the different solutions of which it is capable, may be given by indicating very briefly the way in which it was dealt with by three philosophers who may be selected as typical of different modes of thought—Spinoza, Kant, and Lotze. Spinoza decides the question from the point of view of a monistic conception of things—i.e. he conceives the universe as one and manifesting a single necessary law in its various modes. There is therefore no such thing as contingency either in man or nature. Belief in free-will is simply a result of ignorance. Men think themselves free because conscious of their

actions but ignorant of the causes of these actions. Kant's treatment of the question is an attempt to reconcile determinism with freedom. The causality of nature which binds effect to cause in unbroken chain must be recognised to hold not only of the physical world, but also of the mental sequence of motive, desire, and act. But while this conception rules our experience, it is still possible to look upon the whole series of sense-phenomena—i.e. the whole causality of nature—as itself an effect of the causality of freedom. This idea is indeed only a regulative idea giving method and plan to our knowledge, and not entering into knowledge. Further importance is given to it, however, when we enter upon ethical considerations. The moral law, which requires absolute obedience, implies (unless our nature contradict itself) that such obedience can be rendered. Free-will thus implied by the moral law would conflict with the causality of nature if conceived of as operating in time. It is only thinkable as the law of an intelligible world (from which the sensible world may be said to proceed), and as thus at once reason, law, and will. Will is therefore free not only because above the causality of nature, but because it is autonomous or a law to itself. The weakness of this theory, however, lies in the opposition between the intelligible and sensible worlds. Kant has no means of showing how intelligible freedom may manifest itself in the development of actual character. He asserts at once the constancy of causal connection and the ethical worth of free-will; but no real harmony between the two is brought about. To hold fast the conception of law in mental phenomena—which recent psychology has made increasingly manifest—and at the same time to assert and harmonise with it the rational conviction that a place must remain for freedom, is the endeavour of Lotze. Volition, he contends, contains a peculiar element of mental activity not derived from presentation or feeling, though dependent upon them for its appearance. 'Will can have no content other than that supplied by the involuntary flow of ideas and feelings,' but 'we are convinced that we meet with an act of will only where the impulses urging to action are apprehended in distinct consciousness, and where the decision whether they shall be followed or not is deliberated upon and is left to be determined by free choice of the mind.'

Full treatment of the subject of Will is given in most of the psychological treatises quoted in the article PSYCHOLOGY, to which must now be added Sully, *The Human Mind* (2 vols. 1892), which gives a very complete and discriminating account of the whole subject. Amongst recent works of physiological psychology may be mentioned G. H. Schneider, *Der thierische Wille* (1880), *Der menschliche Wille* (1882); Th. Ribot, *Les Maladies de la Volonté* (1882); H. Münsterberg, *Die Willenshandlung* (1888). To the Hegelian influence is due the work of W. Vatke, *Die menschliche Freiheit in ihrem Verhältniss zur Sünde und zur göttlichen Gnade* (1841). Lotze's view is worked out and defended by H. Sommer, *Ueber das Wesen und die Bedeutung der menschlichen Freiheit* (1882). A useful outline of different views, and references to literature, are given by O. Külpe, *Die Lehren vom Willen in der neueren Psychologie* in Wundt's *Philosophische Studien* (vol. v. 1889). Historical accounts of the free-will controversy are given in Bain's *Mental and Moral Science*, pp. 406–428, and Volkmann's *Lehrbuch der Psychologie*, sect. 151. See also the controversy between W. G. Ward, A. Bain, and S. H. Hodgson in *Mind*, vols. v. and vi., and the articles therein referred to, and Hodgson in *Mind*, vol. xvi. pp. 161 ff. For Schopenhauer's view of will as the ultimate principle of things, see SCHOPENHAUER.

Willemstad, capital of Curaçao (q.v.), with considerable transit trade as a free port.

Willet (*Symphemia semipalmata*), a North American bird of the snipe family, also called Stone Curlew. It belongs to the tattler group, and is semi-palmate (its toes being half-webbed). Found plentifully as far north as 56°, it winters in the southern states.

William I., king of England, called the Conqueror, bastard son of Robert III., Duke of Normandy, by Arletta, daughter of a tanner of Falaise, was born at Falaise in 1027 or 1028. News of his father's death on pilgrimage having reached Normandy in 1035, the nobles accepted him as duke. Many of them, however, rebelled against him, and were helped by his feudal superior, Henry I. of France. His guardians were faithful to him, but three of them were murdered, and his youth was passed in the midst of difficulty and danger. In 1047 the lords of the western, or Danish, part of the duchy rebelled, and William nearly fell into their hands at Valognes. King Henry came to his help, and the king and duke defeated the rebels at Val-ès-dunes. This victory established William's power in Normandy. He ruled his duchy vigorously, and won two fortresses on the frontier of Maine. In 1051 he visited his cousin, Edward the Confessor, the English king, and received from him a promise that he should succeed him in England. He married Matilda, daughter of Baldwin V., Count of Flanders, in 1053, though the marriage had been forbidden by the pope on the ground of consanguinity. Lanfranc, Abbot of Bec, reproved him for this marriage, and William ordered him to quit the duchy, but was quickly reconciled, and Lanfranc prevailed on the pope to confirm the marriage, William, as an atonement, building the abbey of St Stephen, and Matilda the abbey of the Holy Trinity, both at Caen. In the next ten years William repulsed two French invasions, and in 1063 conquered the county of Maine. Probably in 1064 Harold, Earl of Wessex, was at his court, and swore to help him to gain the English crown on Edward's death. When, however, Edward died, in 1066, Harold became king. William laid his claim before the pope and western Christendom; he was the last king's kinsman; Edward had promised him the crown; Harold had broken his oath. Warriors joined him from many lands; the pope approved his claim, and by sending him a consecrated banner invested his expedition with something of the character of a crusade. On 14th October he defeated Harold at the battle of Hastings, at a place called by one chronicler Senlac, where he afterwards built Battle Abbey. Harold was slain, and William, having received the submission of the English nobles, was crowned king on 25th December.

England, however, was not yet subdued, and, after a visit to Normandy, William set about completing the conquest. The west and north were subdued in 1068, but the next year the north revolted, and William cruelly devastated the whole country between York and Durham. In 1070 the conquest was completed. The king everywhere confirmed his power by building castles. Although the English generally were allowed to redeem their lands, those who resisted him suffered confiscation. With the confiscated lands he rewarded his followers, granting them to be held of himself, perhaps by military service, though this is contrary to the opinion of some eminent historians. While William made little formal change in the law, the constitution under him assumed a feudal aspect, the old national assembly becoming a council of the king's tenants-in-chief. But he was careful to guard against the evils of continental feudalism; all title to land was originally derived from his grant; he distributed his grants to his great lords over several counties, and in 1086 he exacted an oath of fealty from all landowners, whether holding

immediately of him or of other lords. Domesday Book, compiled by his order in that year, contains the record of the land settlement, and of the value of the land for fiscal purposes. The chief result of William's system was a large increase in the power of the crown. He brought the English Church into closer relations with Rome, using the papal authority to forward his own policy with respect to it, while he resisted all interference derogatory to his sovereignty, laying down rules defining the rights of the crown with reference to the papacy, and refusing a demand of homage made by the pope. The intimate union between the church and state in matters of jurisdiction and legislation characteristic of the old English system was abolished, church synods were frequently held, and ecclesiastical causes were removed from the sphere of the lay courts. William's policy, which was ably carried out by Lanfranc, Archbishop of Canterbury, while raising the character of the church, gave the papacy a stronger hold upon it, and tended to endanger the royal authority over it should the throne be occupied by a less capable ruler, or should a dispute arise between the church and the crown. The Conqueror, however, was supreme both in church and state. His rule was stern and orderly; he was greedy of money, and, though not wantonly cruel, careless of human suffering. Passionately fond of hunting, he devastated a large tract in Hampshire to form the New Forest, and heavily punished any breach of his forest laws. All offences were severely dealt with, and mutilation was frequently inflicted, but he forbade capital punishment.

Revolts were made against William both in England and on the Continent. In 1070 there was a rebellion in the Fen Country; the hopes of the rebels were excited by the coming of a Danish fleet, and under the leadership of Hereward they for some time defended the Isle of Ely against the king. English exiles were sheltered by the Scottish king Malcolm, who plundered the northern shires; but William in 1072 crossed the Forth, and compelled Malcolm to make peace and to do him homage at Abernethy. In 1073 he reconquered Maine, which had revolted from him. During his absence in Normandy in 1075 the foreign earls of Hereford and Norfolk rebelled, and a Danish fleet appeared in the Humber. The English, however, were faithful to the king, and the rebellion was quickly suppressed. Waltheof, the English earl of Northumbria, had for a moment been implicated in the plot, and William, who put no one else to death for a political offence, had him beheaded. He made a successful expedition into South Wales, penetrating as far as St Davids. In his later years he engaged without success in some small wars in France. His eldest son, Robert, rebelled against him in Normandy in 1079, defeated and wounded his father at Gerberoi, and went off into France. Having entered on a war with Philip I. of France in 1087, William burned Mantes. As he rode through the burning town his horse stumbled, and he received an injury of which he died at Rouen on 9th September. He left Normandy to his son Robert, declared his wish that his next surviving son William should succeed him in England, and gave his youngest son Henry a sum of money. He was buried in the abbey church that he had built at Caen (q.v.).

William II., king of England, called Rufus, third, and second surviving, son of William the Conqueror, was born before 1066. On his father's death in 1087 he was crowned king at Westminster. The next year many of the Norman nobles in England, with the king's uncle Odo, Bishop of Bayeux and Earl of Kent, at their head, rebelled against him, in favour of his eldest brother Robert, Duke of Normandy; for they knew that Rufus would be a stern master, whereas in Robert they would have a king that would not trouble himself to enforce order. Rufus appealed to the English people for help, promising them good government and a relaxation of the forest laws and of fiscal burdens. They flocked to his standard, the bishops upheld his cause, and the rebellion was suppressed. He did not keep his promises; he taxed the people heavily, maintained the forests, and punished offences against the forest laws with death. He was an able man and a strong ruler, but was violent, boastful, profane, and unspeakably immoral. Always full of magnificent designs, he lacked stability of purpose, and consequently his achievements, though great in themselves, fell short of his plans. He largely employed mercenary soldiers, and allowed them to ill-use his people. By the agency of his justiciary, Randolf Flambard, he oppressed his tenants-in-chief by abusing his rights as feudal lord, making them pay him excessive sums by way of 'relief' on entering on their estates, and so on. The lesser people groaned under the harsh administration of the law, and seem to have had to suffer to make good what the king took from their lords. Treating ecclesiastical benefices as far as possible like lay fiefs, Rufus sold them, and kept them vacant, seizing their revenues during vacancy. Besides other bishoprics the see of Canterbury had been vacant for four years when, in 1093, he fell sick, repented, and appointed Anselm, a holy and learned man, to the archbishopric. When Rufus recovered he resumed his evil life, and quarrelled with Anselm because he maintained the rights and liberties of the church. At the Council of Rockingham, where in 1095 the king tried to crush his resistance, the primate, though deserted by his suffragans, was defended by the lay lords; but in 1097 Anselm, despairing of justice in England, departed to lay his cause before the pope, and did not return again until after the king's death.

Mindful of the trouble that Robert had brought upon him in England, Rufus made war upon him in Normandy, where the duke's lax rule had led to much confusion. Peace was made in 1091, and the duke and king joined in besieging their brother Henry in Mont St Michel, and forced him to surrender. In 1094 Rufus again invaded Normandy, which was rent by private wars. Impatient of his strong rule, some Norman lords in England, headed by Robert of Mowbray, Earl of Northumberland, raised a rebellion against him at home, which was speedily crushed. His power was strengthened in 1096 by the acquisition of Normandy, which was mortgaged to him by the duke, and which he soon brought into order. The feudal lords in England were no longer able to expect help against him from Normandy, and he gained a double hold over such of them as had lands on both sides of the Channel. The acquisition of Normandy led him to make an attempt to conquer the adjoining French district of Vexin, but in this he was unsuccessful. In 1098 he reconquered Maine, which Robert had lost. The next year its former count, Helias, recovered it, and

Rufus, though he again invaded Maine and won back its capital, Le Mans, did not complete the reconquest of the county. This was characteristic of him; he had wonderful energy, but little perseverance, and after entering on a war with vigour would let it die out before he had fully accomplished his purpose. At home he enlarged his kingdom by the conquest of Carlisle and its district from its Scandinavian lord. This conquest probably offended Malcolm, king of Scotland, who invaded Northumberland in 1093, and was slain at Alnwick. Rufus upheld the right of Malcolm's eldest son Duncan, who had lived at his court, against his uncle, and later favoured the cause of Duncan's half-brother Edgar, who, after gaining the kingdom, remained on good terms with England. Rufus thrice invaded Wales, twice with signal ill-success, and, finding that he could not subdue it by leading an army against it, built castles on the borders. The lords of the border castles kept up a continual warfare with the Welsh, conquering the land piecemeal without costing the king anything. Towards the end of the reign, however, the Welsh won back some districts that they had lost. In 1100 Rufus was planning the acquisition of Aquitaine, which its duke proposed to pledge to him. But as he was hunting in the New Forest on 2d August he was slain accidentally, as is most probable, by an arrow shot by one of his companions named Walter Tirel. He was buried in Winchester Cathedral without any religious service; for his wickedness had been great, and men looked on his death as a judgment of God. He was never married.

William III. was the posthumous son of William II. of Orange (1626–50) by Mary (1631–60), the eldest daughter of Charles I. of England. He was born at the Hague on 4th November 1650. The alliance of his house with the Stuarts aroused the jealousy of Cromwell; and by his influence the baby-prince and any of his lineage were declared to be excluded from the Stadtholdership of the United Provinces. The restoration of Charles II. in England improved his nephew's prospects; and on the murder of De Witt in 1672 (a murder at which William connived) he was chosen Stadtholder. The republic was at this time carrying on an apparently hopeless contest with its powerful neighbour, Louis XIV. of France; but by the valour and wisdom of the young Stadtholder, who announced his readiness 'to die on the last dyke,' the war was in 1678 terminated by the treaty of Nimeguen in a manner advantageous and honourable for the United Provinces. On 4th November 1677 William had married his cousin, the Princess Mary (born 30th April 1662), elder daughter by Anne Hyde of the Duke of York, afterwards James II.—a political match, which did not at first prove a happy one. Until the birth of her half-brother on 10th June 1688 Mary was heir to the English crown; naturally William gave no countenance to Monmouth's expedition (1685), and as naturally that birth was a blow to William's ambition and to his hopes of stemming the renewed aggression of France, against which with consummate diplomacy he had in 1686 formed a great European league. But James's tyranny was estranging from him the affections of every class of his subjects; the eyes of all Englishmen were turning towards the Stadtholder as their only hope; and, on the day that the Seven Bishops were acquitted, seven Englishmen of high position, both Tories and Whigs, invited him to come over and redress their grievances. Having once formed his resolution, William conducted the operations with great secrecy and skill. On 5th November 1688 he landed at Torbay with an army of 15,000, composed of English and Dutch. His success was rapid and bloodless. Men of all parties came over to him; on 23d December James fled the kingdom; and, the throne having been declared vacant by the Convention Parliament, on 13th February 1689 William and Mary (she had landed the day before) were proclaimed king and queen of Great Britain and Ireland. The assembling of a free parliament had been, he professed, his sole object; but his acceptance of the warming-pan fiction, and his refusal to have any share in the government save as king in his own person and for the term of his life, sufficiently reveal his aims.

James's adherents held out for some time in Scotland and Ireland, but the fall of Dundee at Killiecrankie ended their resistance in the former country (July 1689), whilst in the latter their last stronghold, Limerick, had to surrender (October 1691). William thus was left free for his continental campaigns, in which, great soldier though he was, he found himself outmatched by Luxembourg. The latter's death in 1695 was a turning-point in the war, which yet was ended only by the peace of Ryswick (1697), a peace distasteful to William, but highly popular with his English subjects. In spite of his sterling qualities, and of the debt that they owed him, he and they were never in sympathy; his foreign birth, his reserve, his very ill-health were against him. The death by smallpox on 28th December 1694 of his wife, for whom, though not faithful to her, he sorrowed inconsolably, materially injured his position. His schemes were thwarted by parliament; continual plots for his assassination were hatched by James's adherents; and the death in 1700 of Charles II. of Spain, and the succession of Philip of Anjou, was another blow to his policy. He pursued it, however, with unflagging vigour till his death, which took place at Kensington on 8th March 1702. His horse (it had been Sir John Fenwick's) a fortnight before had stumbled over a molehill and thrown him: hence the Jacobite toast, 'To the little gentleman in black velvet.' During his reign the Bank of England was established, the modern system of finance introduced, ministerial responsibility recognised, the liberty of the press secured, and the British constitution established on a firm basis.

D. Traill's *William III.* ('Twelve English Statesmen' series, 1888).

William IV., the 'sailor-king,' was born at Buckingham Palace on 21st August 1765. The third son of George III., till 1771 he remained, along with the Prince of Wales and Prince Frederick, under the care of Dr Majendie, and then was sent to Kew, where, with Prince Edward, afterwards Duke of Kent, he was under the guardianship of Colonel Budé. He entered the navy as a midshipman in 1779, and, having seen some service off the coast of America and in the West Indies (he was the first English prince that visited the New World), in 1785 was promoted to lieutenant, and in 1786 to captain. In June 1789, having a year and a half before returned from Halifax to England without leave, he was created Duke of Clarence and St Andrews and Earl of Munster, with an allowance from parliament of £12,000 a

year; but his professional career was at an end, although he was formally promoted through the successive ranks to that of Admiral of the Fleet (1801), and although during 1827–28 he held the revived office of Lord High Admiral. From 1790 to 1811 he lived with the actress Mrs Jordan (q.v., 1762–1816), who bore him five sons and five daughters; on 13th July 1818 he married Adelaide (1792–1849), eldest daughter of the Duke of Saxe-Meiningen. Of the two daughters born of this marriage in 1819 and 1820, one lived but a few hours, and the other only three months. By the Duke of York's death in 1827 the Duke of Clarence became heir-presumptive to the throne, to which he succeeded at the death of his eldest brother, George IV., on 26th June 1830. A steady Whig up to his accession, he then naturally turned Tory, and did much to obstruct the passing of the great Liberal measure of his reign, the first Reform Act (1832). The abolition of colonial slavery (1833), the reform of the poor-laws (1834), and the Municipal Reform Act (1835) were immediate results of that great constitutional change. The plain, bluff king, whose eccentricity it was at one time feared would end in insanity, died at Windsor, after a short illness, on 20th June 1837, and was succeeded by his niece, Queen Victoria.

See (besides the articles on his premiers, GREY, MELBOURNE, and PEEL, with works there cited) the Duke of Buckingham's *Courts and Cabinets of William IV. and Victoria* (2 vols. 1861); the *Greville Memoirs;* and Percy Fitzgerald's *Life and Times of William IV.* (2 vols. 1884).

William the Lyon, king of Scotland, was born in 1143, a grandson of David I., and brother of Malcolm IV., whom he succeeded in 1165. Whence he derived his designation is one of the mysteries of history. When heraldry long afterwards became a science, and was supposed to have been in use earlier than it really was, it was not unnaturally supposed that he was the first king who used, as a heraldic achievement, the lion, afterwards the chief feature in the arms of Scotland. His predecessors had long contested with the kings of England the sovereignty of Northumberland and other districts of what is now the north of England. Under Malcolm these claims were virtually abandoned, and the king of Scots received, as a sort of equivalent for them, the earldom of Huntingdon and other valuable estates, holding of the English crown. William had still, however, a hankering after the Northumbrian districts. He attended Henry of England in his continental wars, and is supposed, when doing so, to have pressed for a portion at least of the old disputed districts. In his disappointment he invaded them after the example of his ancestors. On the 13th July 1174 he fell, near Alnwick Castle, into the hands of an English party. For security he was conveyed to Normandy, and there he consented, as the price of his liberation, to perform that homage for his kingdom which the English kings so long in vain attempted to exact from the government of Scotland. How far the Scots community would have admitted that he had a right to bind them in such a condition may be doubted. The treaty of Falaise, however, as the transaction was termed, from the place where it was adjusted, was revoked in the year 1189 by Richard I. of England in consideration of a payment of 10,000 marks, which he wanted for his celebrated expedition to Palestine. William had several disputes with the church, but he was one of the early benefactors of the regular ecclesiastics, and founded in 1178 the great abbey of Arbroath, which he dedicated to Thomas Becket, slain eight years earlier. William died at Stirling in 1214.

William the Silent, Prince of Orange (1533–84), was the means of freeing the Netherlands from the Spanish yoke, and his biography is interwoven with the history of Holland (q.v., Vol. V. p. 742). See also the works cited at the end of that article; and, on William himself, Klose, *Wilhelm I. von Oranien* (Leip. 1864); Juste, *Guillaume la Taciturne* (Brussels, 1874); Barrett, *William the Silent* (Boston, 1883); Kolligs, *Wilhelm von Oranien* (Bonn, 1885); his correspondence, edited by Gachard (Brussels, 1847–66); and *William the Silent*, by Ruth Putnam (2 vols. 1895).

William I., seventh king of Prussia and first German emperor, was the second son of Frederick-William III. and his queen Louisa, of Mecklenburg-Strelitz. He was born on the 22d of March 1797, in the palace at Berlin. Although he lived to a great age, he was very delicate in his childhood, and was reared with difficulty. At Christmas 1803 he donned the military uniform of the celebrated regiment now known as the Red Hussars. The prince's education was entrusted first to Privy-councillor Dellbrück and afterwards to Professor Reimann; and in the science of war he had the benefit of the tuition of Generals Von Scharnhorst and Von Knesebeck. His instructor in law was the celebrated international jurist De Savigny; and he took lessons in the plastic arts from Rauch, the sculptor, and Schenkel, Berlin's greatest architect. He formally entered the army in January 1807, and within a year got his first promotion. He received constant instruction in military tactics; and in 1814 the prince crossed the Rhine in the staff of his father, and on the 27th of February received his 'baptism of fire' on French territory, at Bar-sur-Aube. He behaved with such gallantry that the emperor of Russia conferred upon him the Cross of St George, while the king of Prussia awarded him the Iron Cross. As his military career began with the 1814 campaign against the first Napoleon, so was it destined to close with the campaign of 1870–71 against the third Napoleon. The prince entered Paris with the allies on the 31st of March 1814.

Prince William was made a privy-councillor in 1817, and in the following year, on attaining his majority, he was advanced to the rank of a major-general in the army. During the king's absence in Russia he was entrusted with the charge of the whole Prussian military department. In 1825 he went to St Petersburg, conveying the king of Prussia's congratulations to the Czar Nicholas on his accession. In June 1829 the prince was married to the Princess Augusta of Saxe-Weimar. By the accession of his brother, Frederick-William IV., in 1840, he became heir-presumptive, and assumed the customary title of Prince of Prussia. In 1844 he visited England, and formed a friendship with Queen Victoria and the Prince Consort, which was cemented by several subsequent visits. During the revolutionary events of 1848 the Prince of Prussia's attitude towards the people was severely criticised, and for a time he was very unpopular at Berlin. He was obliged to quit Prussia, and, proceeding to London, took up his quarters at the Prussian Legation. In two months, however, he received his recall. As deputy for the district of Wirsitz he defended his conduct and policy in the first National Assembly. In 1849 he subdued the disaffection in Baden. In 1855 he presided over the military commission which decided upon the adoption of the needle-gun throughout the Prussian army; and on the 1st of January ensuing he celebrated his fifty years of military service. In 1858 his son, Frederick-William (see FREDERICK III.), married the Princess Royal of England, and the same year the Prince of Prussia received and entertained Queen Victoria and Prince Albert on their visit to Germany. In consequence of the prolonged disable-

ment through paralysis of the king of Prussia, the prince was formally appointed regent of the kingdom, October 7, 1858. He carried out searching army reforms, and took an active share in European diplomacy. On the 2d of January 1861 Frederick-William IV. expired at Sans Souci, and the Prince of Prussia succeeded to the throne as William I. Great hopes were entertained of a more liberal policy than was favoured by the deceased monarch, but King William soon manifested his intention of consolidating the throne and strengthening the army rather than launching forth upon a career associated with popular progress. A few months after his accession the king narrowly escaped assassination at the hands of a Leipzig student named Oscar Becker.

Determined to press forward his new scheme for increasing the army, and making its strength immediately available, the king discovered in Prince Bismarck (q.v.) an able instrument for effecting his purposes. Bismarck was placed at the head of the ministry, with Roon—the author of the new army system—as war minister. The scheme was very unpalatable to the parliament, but the minister-president forced it upon the nation, with the necessary increased expenditure, by overriding the constitution. In 1864 the Sleswick Holstein difficulty led to a war with Denmark (q.v.), in which the Prussian and Austrian troops were victorious; and in 1866 the two allied powers quarrelled over the spoils, and struggled for the supremacy amongst the German states. Austria (q.v.) was crushed by the battle of Sadowa, which closed the Seven Weeks' War, and Prussia gained in territory and prestige by her victories. France, alarmed by the growing ascendency of Prussia in Europe, endeavoured to form a confederacy of the South-German states, but the project failed. The affair of the duchy of Luxemburg nearly led to a war between France and Prussia in 1867, but the difficulty was adjusted by the treaty of London, which declared the duchy to be a neutral state. Shortly afterwards King William and Prince Bismarck visited the Emperor Napoleon at Paris, the Great Exhibition furnishing the occasion for this peaceable *réunion*. In 1870, however, the inevitable struggle between France and Prussia was precipitated. The Spanish throne having become vacant, Prince Leopold, son of the Prince of Hohenzollern-Sigmaringen, was put forward as a candidate. The prince agreed to accept the Spanish crown if the Cortes chose him. As King William was the head of the House of Hohenzollern, this gave great umbrage to the war party in France, who bitterly denounced Bismarck as the promoter of Prince Leopold's candidature. Although the candidature was withdrawn, Napoleon III. still forced a quarrel on Prussia, by making impossible demands upon the king, and war was declared between the two countries. William took the field on July 31, and issued a proclamation affirming that a neighbouring state had declared war against Prussia without any cause. In the deadly struggle which ensued King William, who was then seventy-three years of age, acted as real commander-in-chief of the Prussian army. The French forces were defeated almost everywhere with great slaughter; Napoleon capitulated at Sedan; and by the end of September the city of Paris was invested. While William was at Versailles in December, the North-German parliament, together with the princes of Germany, pressed upon him the acceptance of the imperial crown of Germany, and on the 18th of January 1871 he was proclaimed as German emperor. Peace was signed on February 26—Germany receiving a large war indemnity and recovering Alsace and Lorraine; and on March 1 the German troops entered Paris.

Interviews between the German and Austrian emperors in August-September 1871 were supposed to indicate the formation of an Austro-German alliance, which was strengthened by the adhesion of the czar in 1873. The Emperor William visited Victor Emmanuel at Milan in 1874; and the peace of Europe was further assured by the strict neutrality of Germany during the Russo-Turkish war of 1876–77. During this period the emperor and Prince Bismarck were engaged in consolidating the fabric of Teutonic unity. For some years, nevertheless, there was great friction between the Vatican and the court of Berlin on the question of the imperial jurisdiction over German Catholic subjects; but on the accession of Pope Leo XIII. a more amicable spirit prevailed, and the dispute was finally closed in 1883 by concessions to the ultramontane party. The rapid rise of Socialism in Germany led to severe legislative measures, and in 1878 the emperor's life was twice attempted by adherents of the Socialist party—first by a mechanic named Max Hödel, and secondly by Dr Karl Nobiling. On the latter occasion the aged emperor was seriously wounded, but he recovered his health in a surprising manner.

The emperor celebrated his golden wedding June 11, 1879. On the 15th of October 1880 he was present at the opening of Cologne Cathedral, and on the 28th of September 1883 he unveiled the great national monument on the Niederwald, near Rudesheim. Here another attempt was made upon his life, which was followed by still more stringent measures against the Socialists. The ninetieth anniversary of the emperor's birth was celebrated with great rejoicings throughout Germany on the 22d of March 1887. The veteran monarch, however, did not long survive the celebration, as he died on the 9th of March 1888. William I., though holding tenaciously to the prerogatives of the kingly office, was of a simple and unassuming personal character. He was frank, open-hearted, generous, sincere, and pious; withal he had an inflexible will, and high moral and physical courage. Humane and magnanimous, he was yet a born ruler of men.

See Schmidt and Otto's *Kaiser Wilhelm und seine Zeit*; Lowe's *Prince Bismarck: a Historical Biography*; E. Simon, *The Emperor William and his Reign* (trans. from the French, 1886); the present writer's *William I. and the German Empire* (1887); A. Forbes, *Life of Emperor William* (1889); *Politische Korrespondenz Kaiser Wilhelms I.* (1890); S. Whitman's *Imperial Germany* (1891); and W. Oncken, *Das Zeitalter des Kaisers Wilhelm* (2 vols. 1892).

William II., third German emperor and ninth king of Prussia, was born at Berlin, 27th January 1859, the son of the Crown-prince Frederick and the Princess Victoria (Princess Royal) of England. After a careful home education, he studied at the gymnasium in Cassel, passing the leaving examination. He also underwent a systematic and very thorough military training, and was early drilled in administrative methods and governmental usages. In spite of an accident at his birth which permanently weakened his left arm, he became an admirable horseman and an indefatigable hunter. He is also an enthusiastic yachtsman. Called to the throne by the death of his father, Frederick III., in 1888 (when his mother, three months an empress, retired into private life), he showed in all departments of imperial government, in all that concerned foreign relations, in the management of army and navy, an irrepressible and exuberant energy. He startled Europe by speeches in which he indicated a very exalted notion of his imperial responsibility, and intimated his resolve to maintain the high monarchical traditions of the Hohenzollern house. He made a series of tours to foreign courts—St Petersburg,

Copenhagen, Rome, &c.—and early showed himself to be restless, capricious, and strong-willed, with an overweening sense of the divine right of his imperial power. He often speaks very unadvisedly with his lips on public occasions. At once a lord of hosts, a yachtsman, a poet, a composer, a painter, and a preacher, he has had to endure the defeat or withdrawal of several favoured schemes as reactionary or impossible– a religious education bill, several anti-Socialist measures, and a vast increase of the fleet. The course of public events has been sketched at GERMANY (Vol. V. p. 186)—the succession of chancellors, the increase of the army, the growth of trade and commerce, colonial expansion, lese-majesty prosecutions, and the embitterment of relations with England. By the attitude of Germany towards Turkey before and after the Greek war the Concert of Europe was much hampered, even if the Triple Alliance has been formally maintained. As a grandson of the Queen, he was popular in England till his famous Transvaal telegram was held to reveal an enemy. By his marriage (1881) with a Sleswick-Holstein princess he had six sons and, in 1892, a daughter. In Jan. 1901, on Queen Victoria's death, he more than regained his former popularity in Britain, and at Osborne on his birthday he was made a British field-marshal by his uncle, the new king, Edward VII. See Charles Lowe, *The German Emperor* (1895).

William and Mary College, next to Harvard College the oldest institution of learning in America, was established at Williamsburg, Virginia, in 1693, to train students for the Episcopal ministry. It was endowed with lands, and placed under the patronage of the king and queen of Great Britain; and it became the wealthiest college of America. At the Revolution, however, it lost most of its possessions, half the students entered the army, and the French troops occupied its buildings as a hospital. Here were educated Jefferson, Madison, and Monroe, and General Scott. Its students now hardly exceed a score.

William of Malmesbury. See MALMESBURY; for William of Champeaux, SCHOLASTICISM.

William of Newbury, chronicler, one of the chief authorities for the reign of Henry II., was a native of Bridlington in Yorkshire, and lived from 1135 to 1200. His *Historia Rerum Anglicarum* is divided into five books, extending from the year 1066 to 1198. It is clear, sound, and unprejudiced, the characters drawn with discrimination, and the narrative is especially valuable as an authority on the struggle between Becket and the king. It was edited for the English Historical Society by Mr Hans Hamilton (2 vols. 1856).

William of Tyre, historian, was probably born about 1137, but at any rate was appointed archdeacon of Tyre in 1167, and archbishop of Tyre in 1175. He was tutor to Baldwin, son of king Amalric, and was one of the six bishops who represented the Latin Church of the East at the Lateran Council (1179), and on the return journey spent some months with the Emperor Manuel at Constantinople. His history breaks off abruptly about the end of 1183. William of Tyre's *Historia Rerum in Partibus Transmarinis Gestarum* worthily fills up the space between the periods treated by Fulcher of Chartres and Ernoul, that is from 1127 to 1184. There is a 13th-century French translation, edited by P. Paris (2 vols. 1879–80), often styled *Roman d'Eracle*, simply because the name of Heraclius occurs in the first sentence. Another work was the *Historia de Orientalibus Principibus*, undertaken at the request of Amalric. As a historian William of Tyre is painstaking, learned, unprejudiced, with the gift moreover of graphic delineation.

William of Wykeham. See WYKEHAM.

Williams, ISAAC, Tractarian, was born on 12th December 1802 at Cwmcynfelin near Aberystwith, his maternal grandfather's home, and was brought up in London, his father being a Chancery barrister. He was educated at Worpleston near Guildford, at Harrow, and at Trinity College, Oxford; in 1822 made the acquaintance of Keble, and through him of Hurrell Froude; and in 1829 was ordained to the Oxfordshire curacy of Windrush. Elected in 1831 a fellow of his college, he was subsequently curate to Newman, and at Bisley; in 1842 stood unsuccessfully for the Oxford chair of Poetry; and for seventeen years lived at Stinchcombe, Gloucestershire, where he died, 1st May 1865. His works, nearly thirty in number, were chiefly religious poetry; but the most noteworthy was Tract 80, on 'Reserve in Religious Teaching.' See his *Autobiography* (1892).

Williams, JOHN, missionary martyr, was born at Tottenham, near London, 29th June 1796. At fourteen he was apprenticed to an ironmonger, but having offered himself to the London Missionary Society, was sent in 1816 to Eimeo, one of the Society Islands. Later he settled in Raiatea, the largest of the group, and laboured here with marvellous success, his powers of organisation being as conspicuous as his zeal. In 1823 he went to Raratonga, the chief of the Hervey Islands, and ere long the whole group was Christianised. He next built a boat 60 feet long, and 18 wide, the sails of native matting, the cordage of the bark of the hibiscus, the oakum of cocoa-nut husks and banana stumps, and in this vessel during the next four years he visited many of the South Sea Islands, extending his missionary labours to the Samoa Islands. In 1834 he returned to England, and remained nearly four years, superintending the printing by the Bible Society of his Raratongan New Testament, and raising £4000 to equip a missionary-ship for Polynesia. In 1838 he went out again, visited many of the stations he had already established, and sailed as far west as the New Hebrides, where he hoped to plant a mission, but was killed and eaten by the savage natives of Erromango, November 20, 1839. He published his *Narrative of Missionary Enterprises* in 1837. See the Memoir by Rev. Ebenezer Prout (1843).

Williams, SIR MONIER MONIER-, Sanskrit scholar, was born at Bombay, 12th November 1819, and educated at King's College, London, and Balliol and University Colleges, Oxford, taking the Boden scholarship in 1843, and graduating B.A. in 1844. He was professor of Sanskrit at Haileybury (1844–58), and a master at Cheltenham (1858–60), when he was appointed Boden professor of Sanskrit at Oxford. Knighted in 1886, at the opening of the Indian Institute established mainly through his energy, he died 11th April 1899.

His books include, besides his last work on Haileybury College (1894), Sanskrit grammars (1846, 1860) and dictionaries (1851, 1872), the *Śákuntalá* (1853) and other Sanskrit texts, *Rudiments of Hindustani* (1858), *Indian Epic Poetry* (1863), *Indian Wisdom* (1875), *Hinduism* (1877), *Modern India and the Indians* (1878), *Religious Thought and Life in India* (1883), *The Holy Bible and the Sacred Books of the East* (1887), and *Buddhism in its connection with Brahminism and Hinduism, and in its Contrast with Christianity*—the Duff Lectures (1889).

Williams, ROGER, founder of the state of Rhode Island, and one of the apostles of Toleration, was born about 1600, somewhere in Wales. In his youth he went up to London and attracted the attention of Sir Edward Coke by his shorthand notes of sermons and of speeches in the Star-chamber, and was sent by him in 1621 to Sutton's Hospital (now the Charterhouse School). It is most probable that thereafter he studied at

Pembroke College, Cambridge; and he was afterwards admitted to orders in the Church of England, but soon became an extreme Puritan, and emigrated to New England, arriving at Boston in February 1631. He refused to join the congregation at Boston, because the people would not make public declaration of their repentance for having been in communion with the Church of England; he therefore went to Salem, as assistant-preacher, but was soon in trouble for denying the right of magistrates to punish Sabbath-breaking and other religious offences, as belonging to the first table of the Law. For his opposition to the New England theocracy he was driven from Salem, and took refuge at Plymouth, where he studied Indian dialects. Two years later he returned to Salem, only to meet renewed persecution and banishment from the colony, for denying the right to take the Indians' lands without purchase, and the right to impose faith and worship. He held that it was not lawful to require a wicked person to swear or pray, which were both forms of worship; and that the power of the civil magistrate extends only to the bodies, goods, and outward state of men, and not to their souls and consciences. Banished from the colony in 1635, and threatened with deportation to England in order to prevent the infection of his pernicious doctrine of toleration from spreading, he escaped in midwinter to the shores of Narragansett Bay, accompanied by a few adherents, where he purchased lands of the Indian chiefs, founded the city of Providence (June 1636), and established a government of pure democracy. Having adopted the belief in adult baptism of believers by immersion, Williams was baptised (1639) by a layman, and then baptised him and ten others, thus founding the first Baptist church in America. Later he doubted the validity of this baptism, and withdrew from the church he had founded. In 1643 he came to England to procure a charter for his colony, and published a *Key into the Language of America* (1643), and *The Bloudy Tenent of Persecution for Cause of Conscience Discussed* (1644), in which the right to religious freedom is argued in a dialogue between Truth and Peace. The chief attempt at an answer he replied to later with *The Bloudy Tenent yet more bloudy by Mr Cotton's Endeavour to wash it White in the Blood of the Lamb* (1652). After going back to Rhode Island, he returned a second time to England on business of the colony in 1651, when he published *Experiments of Spiritual Life and Health, and their Preservations*, dedicated to Lady Vane, and *The Hireling Ministry none of Christ's*. At this period he engaged in an experiment of teaching languages by conversation, and made the acquaintance of Milton, who speaks of him as 'that noble confessor of religious liberty.' He returned to Rhode Island in 1654, and was president of the colony from that year till 1658. He refused to persecute the Quakers, but engaged in 1672 in a famous controversy with them—recorded in *George Fox digged out of his Burrowes* (Boston, 1676). He died in 1683.

See Memoirs by James D. Knowles (Boston, 1834), William Gammell (Boston, 1845), Romeo Elton (Lond. 1853), Reuben A. Guild (1866), H. M. Dexter (1876), and O. S. Straus (1894). His Letters were edited by J. Russell Bartlett (Providence, 1882); his Works by the Narragansett Club (6 vols. 4to, Providence, 1866–74).

Williams, Rowland, Liberal divine, was born at Halkyn in Flintshire, August 16, 1817, and had his education at Eton and King's College, Cambridge. He became fellow, and later tutor, of his college, and in 1850 was appointed vice-principal and professor of Hebrew at Lampeter College. In 1859 he was presented to the vicarage of Broad-Chalke near Salisbury, and hither he retired in 1862 after the storm caused by his contribution, 'Bunsen's Biblical Researches,' to *Essays and Reviews*. He was tried by the Canterbury Court of Arches, and sentenced to suspension for one year, but the Privy-council reversed the judgment. He died January 18, 1870.

His chief books are *Christianity and Hinduism* (1856); *Rational Godliness* (1855); *Broad-Chalke Sermon-Essays* (1867); *The Hebrew Prophets*, translated afresh (2 vols. 1868–71); *Psalms and Litanies* (1872). See the Life by his widow (2 vols. 1874).

Williamsburg, the oldest incorporated town of Virginia, and capital of James City county, lies near the James River, 48 miles by rail ESE. of Richmond. Here are William and Mary College (q.v.) and the Eastern State Lunatic Asylum. Founded in 1632, it was the colonial and state capital till 1779. The town was taken by McClellan after severe fighting on May 5–6, 1862. Pop. 1500.

Williams College, a Congregational college of 200 students at Williamstown, Massachusetts, was founded as a free school by a bequest of Colonel Ephraim Williams in 1755, and incorporated in 1793. In 1838 it was provided with the first public astronomical observatory erected in America (see *Nature*, vol. xxxix. p. 137). This, the Hopkins Observatory, has since been superseded for scientific work by another.

Williamson, Alexander William, chemist, was born in London, May 1, 1824, studied at home, at Paris, and at Giessen, and in 1849 became professor of Practical Chemistry at University College, London, as also in 1855 of Chemistry; he resigned in 1887. He has been president of the Chemical Society and of the British Association; is a corresponding member of the French and other foreign academies; is F.R.S. and LL.D.; and has received numerous medals and distinctions for his researches on etherification, gas analysis, the atomic theory, &c. He has published many papers and lectures, and a well-known *Chemistry for Students*.

Williamsport, capital of Lycoming county, Pennsylvania, on the west bank of the Susquehanna (here crossed by a suspension bridge), 93 miles by rail N. of Harrisburg. It lies in the midst of attractive scenery, and is a popular summer-resort, but is chiefly notable as one of the great lumber marts of the Union. The boom here cost a million dollars, and can hold 300,000,000 feet of lumber. Pop. (1880) 18,934; (1890) 27,132.

Willibrod, or Wilbrord, the apostle of the Frisians, was born in Northumbria about 658, became a Benedictine and scholar of Egbert, and was sent about 690 as missionary to Friesland. He went first to Rome to get the papal benediction, was made Bishop of Utrecht, and laboured with the utmost zeal and success till his death in the abbey of Echternach, 7th November 739. See his Life by Alberdingk Thijm (Münster, 1863); and Ebrard, *Die Iro-Schottische Missionskirche* (1873).

Willimantic, a borough of Connecticut, 31 miles by rail E. by S. of Hartford, with large cotton, silk, woollen, and tin factories, &c., dependent on the power supplied by the Willimantic River, which here falls 100 feet in 1 mile. Pop. 8648.

Willis, Nathaniel Parker, American author, was born at Portland, Maine, January 20, 1806. He came of a race of printers and publishers; his father founded the *Youth's Companion* (1827), which is still issued. Educated at Yale, on the completion of his college course, and after issuing several volumes of poetry, he established the *American Monthly Magazine*, afterwards merged in the *New York Mirror*, in which he was associated with George P. Morris. In 1831 he visited Europe, and contributed to the *Mirror* his *Pencillings by the Way*. Appointed *attaché* to the American legation at Paris, he had favourable

opportunities for observing European society, and after a visit to Greece and Turkey returned to England in 1837, and married a daughter of a British officer, General Stace. He contributed to the London *New Monthly* his *Inklings of Adventure* (republished 1836), and returned to New York and published *Letters from under a Bridge* (1840). In 1844 he engaged with General Morris in editing the *Daily Mirror*, his wife died, and he revisited Europe, and published *Dashes at Life with a Free Pencil* (1845); returned to New York in 1846, he married a daughter of the Hon. Joseph Grinnell of New Bedford, and with his former partner established the *Home Journal*, to which he contributed most of the following works, also published in a collected form: in 1850, *People I have Met* and *Life Here and There;* 1851, *Hurrygraphs, Memoranda of a Life of Jenny Lind;* 1853, *Fun Jottings, A Summer Cruise in the Mediterranean;* 1854, *A Health-trip to the Tropics, Famous Persons and Places, Outdoors at Idlewild;* 1855, *The Rag-bag;* 1857, *Paul Fane;* 1859, *The Convalescent.* Thackeray contributed to his paper the *Mirror*. Much of this work was done during a long, brave struggle with what appeared to be consumptive disease. Mr Willis was an observant and thoughtful writer, discursive, fragmentary, picturesque, sprightly, quaint, and graceful, full of elaborate ease and ingenious spontaneity. He died at Idlewild, near Cornwall-on-the-Hudson, January 20, 1867. See Life in 'American Men of Letters' series (1885), by H. A. Beers, who also edited *Selections* from his prose-writings (1885).—His sister, Sara Payson Willis (1811–72), was a popular writer under the pen-name of 'Fanny Fern.' See *Fanny Fern, a Memorial Volume* (1873), by her husband, James Parton, an industrious journalist and compiler (born 1822).

Willis, Thomas, physician (1621–73), studied at Christ Church, Oxford, was for a time Sedleian professor of Natural Philosophy, but became famous as a physician in Westminster. He wrote on the plague; see Medicine, Vol. VII. p. 118.

Willis's Rooms (closed 1890). See Almack's.

Will-o'-the-Wisp. See Ignis Fatuus.

Willoughby, Sir Hugh, explorer, probably a native of Risley in Derbyshire, of whom little is certain save his unfortunate fate. In 1553 an expedition was fitted out at an expense of £6000 by the merchants of London 'for the discovery of regions, dominions, islands, and places unknown,' and Willoughby was appointed its commander 'both by reason of his goodly personage (for he was of tall stature) and his singular skill in the services of war.' On the 10th of May he sailed from Deptford with three vessels, the *Bona Esperanza* of 120 tons, his own ship, carrying thirty-five persons; the *Edward Bonaventure*, 160 tons burden, commanded by Richard Chancellor, and carrying fifty men; and the *Bona Confidentia* of 90 tons, under command of Cornelius Durfoorth, with twenty-eight men. After sailing along the east coast of England and Scotland, they crossed the North Sea in company, and sighted the coast of Norway about the middle of July. In the middle of September the *Edward Bonaventure*, at Senjen during a storm, parted company with the two other vessels, which were tossed about until they reached the coast of Russian Lapland, where they found a good harbour at the mouth of the river Arzina, in which Sir Hugh determined to pass the winter. Here Willoughby and his sixty-two companions all perished during the course of the winter, doubtless of scurvy. The following year Russian fishermen found the ships with the dead bodies of the crews, together with the commander's journal and a will witnessed by Willoughby, showing that some of the mariners were alive in the January of 1554. Chancellor, after being separated from his comrades, sailed with the third vessel to Vardoehus, where he waited seven days for Willoughby, set out again, and finally reached the mouth of the river Dwina in the White Sea. Here he was well received by the natives, and news of his arrival immediately despatched to the Czar Ivan Vasilievitch, who invited the mariners to the court of Moscow, where they spent a part of the winter, returning in the following summer to England.

Willow (*Salix*), a genus of trees and shrubs of the natural order Salicaceæ, otherwise regarded as a sub-order of Amentaceæ. This order or sub-order, to which the Poplar (q.v.) also belongs, is distinguished by having the flowers naked or with a cup-like perianth; numerous ovules; a naked, leathery, one-celled, two-valved fruit; seeds with long hairs; leaves with stipules. In the willows the flowers are absolutely naked, the stamens from one to five in number, the leaves simple and deciduous. There are many species and very numerous varieties. So widely do British botanists differ as to the number of species indigenous to Britain that Bentham recognises only fifteen, while Babington places them at fifty-eight. They are mostly natives of the colder temperate regions of the northern hemisphere, although some are found in warm countries, as *Salix tetrasperma* in the hottest parts of India, and another species abundantly on the banks of the Senegal. Most of them are shrubs, and some are of very humble growth, particularly those of arctic and alpine regions. Thus, *S. herbacea*, which occurs on the mountains of Scotland, seldom rises more than an inch from the ground. *S. arctica* and *S. polaris* are the most northern woody plants. Other small species are also found to the very limits of perpetual snow in different countries, as *S. lindleyana* on the Himalaya. Some of those which more generally receive the popular name willow are trees of large size and remarkably rapid growth. The

White Willow (*Salix alba*):
a, branchlet of male tree with flowers; *b*, do. female tree (Bentley and Trimen).

White Willow, or Huntingdon Willow, is by far the largest species known in Britain. It attains a height of 80 feet, and grows so rapidly that a cutting has been known to become a tree of

30 feet in ten years. Its head is much branched and spreading, its leaves narrow elliptical-lanceolate, silky beneath, and sometimes also above. The wood of some willows is used for many purposes, being remarkably tough and durable, although light and soft. It was anciently used for shields, and for building sloops of war. Cork-cutters and others employ it for whetting sharp-edged implements, and it is largely used in the manufacture of cricket-bats and for making paddles of steamboats. The leaves and young shoots are in some places used as fodder, and even dried and stacked; and in times of scarcity the bark has been kiln-dried and ground, to mix with meal. Willows are often planted as ornamental trees, especially near streams and in moist grounds. Many kinds are also planted on the banks of rivers, to retain the soil in its place, and restrain the encroachments of the river. They are the better adapted for this purpose that they grow readily by cuttings; and willow-stakes driven into a moist soil strike root, and soon become luxuriant. The twigs of most of the willows are very tough and flexible, and are used by coopers for making hoops, and by gardeners for tying espalier trees, and for many similar purposes. They are much used for basket-making and other kinds of wickerwork (see OSIER); willow withes were probably amongst the first ropes used by man. But the young shoots of many of the kinds with ovate or little elongated leaves are comparatively brittle and ill adapted for wickerwork.

Common Sallow (*Salix cinerea*).

Of this kind are the Sallows, trees or low shrubs with downy branches, generally ovate or obovate wrinkled leaves, having stipules. The Gray or Common Sallow (*S. cinerea*) makes good copsewood and excellent charcoal for gunpowder. Other common species are the Round-eared (*S. aurita*) and Great Round-eared (*S. caprea*) Sallows, the latter growing in a drier soil than the others, and becoming a small tree. The Long-leaved Sallow (*S. acuminata*) has lanceolate leaves. Willow-trees are sometimes treated as pollards, and the lop used for fuel and other purposes. They are also often grown as coppice-wood, yielding a great bulk of hoops, poles, fuel, &c. The Crack Willow (*S. fragilis*), the Goat Willow (*S. caprea*), and others with brittle stems and branches, which are unsuitable for basket-making, are often planted to furnish wood for charcoal for the manufacture of gunpowder, for which purpose it is greatly esteemed. A valuable medicinal principle called *Salicin* (q.v.) exists in the bark of willows; it is more abundant in the Bedford Willow (*S. russelliana*) than in any other species. This species is also remarkable in containing a larger proportion of tannin in its bark than even the oak itself. *S. pentandra*, a British species, besides being tonic is also possessed of aromatic properties. The flowers of the willow, which in many species appear before the leaves, are much sought after by bees. The male catkins (see figure at CATKIN) of many species are very beautiful, the prominent anthers being of a fine yellow colour, or, as in *S. purpurea*, of a rich purple. The sweet-scented male catkins of *S. ægyptiaca* are used in the preparation of a stimulant and carminative liquid much favoured in some parts of the East. The Weeping Willow (*S. babylonica*) is a very ornamental species, a native of the East, now much planted in Britain and on the continent of Europe, on account of its beautiful pendent twigs. Perhaps the most complete collection of willows in cultivation in Britain is that at Woburn, the seat of the Duke of Bedford.

Willow Moth (*Caradrina quadripunctata*), a common British night moth, whose caterpillar is very destructive to stored grain.

Wills, WILLIAM GORMAN, play-writer, was born in Kilkenny county in 1828, studied at Trinity College, Dublin, and was pupil in the art school of the Royal Irish Academy. He became known as a playwright when *The Man o' Airlie* appeared (1866), and followed this up by a series of plays amongst which are *Charles I.* (1872), *Jane Shore* (1876), *Olivia*, *Nell Gwynne*, *Sedgemoor*, and *Claudian* (1885). He also painted portraits and wrote some novels. He died 14th December 1891.

Wills, WILLIAM JOHN (1834–61), explorer. See BURKE (R. O.), AUSTRALIA, Vol. I. p. 592.

Willughby, FRANCIS, ornithologist, the son of Sir Francis Willughby, was born in 1635, and studied at Cambridge under Ray (q.v.). He spent some time at Oxford, and then started on the memorable continental tour (1663–64) with Ray. He died 3d July 1672 from the effects of over-study and hardship on a naturally weak frame. Ray edited and translated his *Ornithologia* (1676–78) and edited his *Historia Piscium* (1686). To the former Buffon and Linnæus were much indebted.

Wilmington, (1) the only large city and a port of Delaware, on the Delaware River and Brandywine and Christiana Creeks, 25 miles by rail SW. of Philadelphia. It is a handsome, regular town, built on the slopes of a hill (240 feet), and contains a granite custom-house, town-hall, large opera-house, the Wilmington Institute, the Old Swedes' Church (1698), &c. Its numerous manufactures include iron steamships, railway cars, engines, machinery, cottons, woollens, powder, leather, flour, matches, &c. Pop. (1880) 42,478; (1890) 61,431.—(2) The largest city and a port of North Carolina, capital of New Hanover county, on the left bank of Cape Fear River, 30 miles from its mouth and 207 miles by rail SSE. of Raleigh. It manufactures turpentine, rice, flour, and cottons, and exports lumber, tar, rosin, turpentine, &c. During the civil war it was one of the chief ports of the Confederacy, and was frequented by blockade-runners. Pop. (1880) 17,350; (1890) 20,056.

Wilmot. See ROCHESTER (EARL OF).

Wilmot Proviso, an amendment to a bill to appropriate $2,000,000 for the purchase of Mexican territory, moved in the United States congress in 1846 by Mr David Wilmot, to the effect 'that neither slavery nor involuntary servitude shall ever exist in any part of said territory.' The proviso passed the house, but was rejected by the senate, the Freesoil movement being the result (see FREESOILERS).

Wilna. See VILNO.

Wilson, ALEXANDER, American ornithologist, was born at Paisley, Scotland, July 6, 1766. He was the son of a weaver, and, though at first intended for the church, he was apprenticed in 1779 to the weaving-trade. Meanwhile he indulged his

fondness for writing verses, for books and nature. He gratified a roving disposition by mounting a pedlar's pack for about three years, and published a volume of poems in 1790. The piece by which he is best remembered is a droll poem in the Scottish dialect, styled *Watty and Meg*, published as a chap-book in 1792, and ascribed by some to Burns. He was prosecuted for a lampoon upon a master weaver during a trade dispute, and afterwards sailed from Belfast for America, and landed at Newcastle, Delaware, July 14, 1794, with a few borrowed shillings in his pocket, and no acquaintances. He got work with a copperplate-printer in Philadelphia, then with a weaver; travelled as a pedlar in New Jersey, where the brilliant plumage of the birds attracted his attention; was engaged as a school-teacher in Pennsylvania, and then walked 800 miles to visit a nephew in New York. Whilst he was teaching a school once more near Philadelphia, William Bartram, who was well acquainted with birds, stimulated and encouraged him in his studies of nature, and Alexander Lawson gave him lessons in drawing, colouring, and etching. His excellence at drawing birds strengthened his resolution to make a collection of all the birds that were to be found in America. In October 1804 he set out on his first excursion, in which he travelled to Niagara Falls, and wrote *The Foresters, a Poem*, and ere his return had walked 1260 miles. In 1806 he was employed on the American edition of *Rees's Cyclopædia*. He soon prevailed upon the publisher, Bradford, to undertake an American Ornithology, and in September 1808 he brought out the first volume, but in a style too costly for the tastes and fortunes of the period. The second volume was brought out in 1810. In 1811 he made a canoe voyage down the Ohio for 720 miles, and travelled overland through the Lower Mississippi Valley, from Nashville to New Orleans, collecting specimens for his third volume. His seventh volume appeared in 1813. In his eager pursuit of a rare species of bird, of which he had long wanted a specimen, he swam across a river, and caught a cold, which ended in his death, at Philadelphia, August 23, 1813, when he had nearly completed his work. The eighth and ninth volumes were published after his death, with memoir by Ord, his assistant. The work was continued by Charles Lucien Bonaparte, in 4 vols. (1828–33); and an edition by Sir W. Jardine (3 vols. 1832) has been more than once reprinted. Wilson was the first to study American birds in their native haunts, and his unrivalled descriptions are remarkable for fidelity and truth. A monument was erected to his memory in Paisley Abbey churchyard in 1874.

There are Lives by Crichton (1816), Ord (1828), Sir William Jardine (1829), Hetherington (1831), Jared Sparks (1851), Brightwell (1861), and A. P. Paton (1863), and a Sketch prefixed to Grosart's edition of his *Poems and Miscellaneous Prose* (2 vols. 1876).

Wilson, Andrew, a son of the Indian missionary, John Wilson (q.v.).

Wilson, Sir Daniel, LL.D., archæologist, was born in Edinburgh, the son of a wine-merchant, 5th January 1816. He was educated at the High School and university, and was early attracted to antiquarian studies. He had been for some time secretary to the Scottish Society of Antiquaries when in 1853 he was appointed professor of History and English Literature in the university of Toronto. He greatly promoted the prosperity of the university, and in 1881 became its president. In 1890 its valuable library was destroyed by fire, but in about a year he had collected a richer library than before. He was knighted in 1888; in 1891 received the freedom of Edinburgh; and died 8th August 1892. Amongst his works are *Memorials of Edinburgh in the Olden Time* (1847; new ed. 1892), which is a model local history; *Oliver Cromwell* (1843); *Archæology and Prehistoric Annals of Scotland* (1851; 2d ed. 1863), with about 200 illustrations drawn by himself; *Prehistoric Man* (2 vols. 1862; enlarged and rewritten 3d ed. 1876); *Chatterton* (1869); *Caliban: the Missing Link* (1873); poems entitled *Spring Wild Flowers* (1875); *Reminiscences of Old Edinburgh* (1878); *Anthropology* (1885); *William Nelson*, a Memoir (privately printed, 1890); *Left-handedness* (1891); *The Lost Atlantis* (posthumous, 1892). He edited for four years the Journal of the Canadian Institute, and was its president 1859–60.

Wilson, Sir Erasmus (1809–84), dermatologist, Egyptologist, and philanthropist, studied at Aberdeen and London, became known as a skilful operator and dissector at the College of Surgeons in London, but was best known as a specialist on skin diseases. He published an *Anatomist's Vademecum*, a student's *Book of Diseases of the Skin*, a *Report on Leprosy*, and, in a very different field, *Egypt of the Past*. The great wealth he acquired by his practice he bestowed largely in benefactions to the poor and to science, founding a chair of dermatology at the College of Surgeons and of pathology at Aberdeen, building new wings to hospitals, and promoting Egyptian research. He it was who brought, at a cost of £10,000, Cleopatra's Needle to England. He was F.R.S., LL.D., president of the College of Surgeons in 1881, and was knighted in the same year.

Wilson, Florence. See Volusenus.

Wilson, George, M.D., chemist, was born at Edinburgh, a younger brother of Sir Daniel Wilson, 21st February 1818. He attended the High School and university, was licensed as lecturer on chemistry in the Edinburgh College of Surgeons, afterwards became a popular lecturer on chemistry in the School of Arts and in the Veterinary College, and in 1855 was appointed professor of Technology in Edinburgh University. In conjunction with this office he was Regius Director of the Industrial Museum of Scotland, an institution which owes much of its completeness and order to his knowledge and skill. He died 22d November 1859. 'His great quality,' says Dr John Brown, 'lay in making men love ascertained and recorded truth, scientific truth especially; he made his reader and hearer *enjoy facts*. He illuminated the book of nature as the monks did the missals of old.'

Amongst his scientific works were *Text-book of Chemistry* (1850), in Chambers's Educational Course; *Researches in Colour-blindness* (1855); and *The Five Gateways of Knowledge* (1856), a delightful hymn or prose-poem of science. Other works were the *Life of Cavendish* (1851); the *Life of Dr John Reid* (1852); and (along with Geikie) the *Memoir of Edward Forbes* (1861). A volume of his letters on religious subjects, with preface by Dr Cairns, was published as *Counsels of an Invalid* (1862), and a volume of essays, *Religio Chemici* (1862). There is a *Memoir* by his sister (new ed. 1862).

Wilson, Henry, vice-president of the United States, was born the son of a farm-labourer at Farmington, New Hampshire, in 1812, and himself worked for eleven years on a farm. Born Jeremiah Jones Colbaith, he got rid of the name when he came of age, worked for a time as a shoemaker at Natick, Massachusetts, became prominent as an Abolitionist in the '30's, addressed sixty meetings for Harrison in 1840, and was elected to the Massachusetts legislature and state senate. He was an active leader of the Freesoilers (q.v.), assisted to form the new Republican party, and in 1855 entered the United States senate. There he sat for

eighteen years, only leaving its floor to assume its presidency as vice-president of the United States in 1873. During the civil war he had been chairman of the important committee on military affairs, and had rendered great services in the matter of organising the army and raising and equipping troops. But in 1873 he had a stroke of paralysis, and died on 22d November of that year. Of his many writings the chief is his *History of the Rise and Fall of the Slave Power in America*, completed by another hand (3 vols. 1872–75). See the Life by T. Russell and the Rev. E. Nason (1872).

Wilson, Horace Hayman, Sanskrit scholar, was born in London, 26th September 1786. He studied medicine, and in 1808 went to India as assistant-surgeon on the Bengal establishment of the E.I.C. His knowledge of chemistry led to his being employed in the Calcutta mint as assistant to Leyden; his mastery of Sanskrit, to his appointment on the recommendation of Colebrooke as secretary of the Asiatic Society of Bengal. In 1833 he became Boden professor of Sanskrit in Oxford, and soon after was appointed librarian at the East India House. These appointments he held till his death, 8th May 1860.

His first work was a verse translation of Kâlidâsa's *Meghadûta*, or *Cloud Messenger* (1813). Next followed a Sanskrit-English *Dictionary* (1819); *Specimens of the Theatre of the Hindus* (3 vols. 1827); translations of the *Raghu Vansa* (1832); the *Vishn'u-Purân'a* (1840); *Rig-Veda-Sanhita Sanskrit Grammar* (1841); *Ariana Antiqua, the Antiquities and Coins of Afghanistan* (1841); *History of British India from 1805 to 1835* (1848); *Rig-Veda-Sanhita* (1850); and *Glossary of Judicial and Revenue Terms, from the Arabic, Persian, Hindustani, &c.* (1855). His collected works have been edited by R. Rost and F. Hall (13 vols. 1861–67).

Wilson, James, economist (1805–60), was born at Hawick, settled in business in London, and became known as an author of books on the Corn Laws and the currency. He founded the *Economist* newspaper, entered parliament as a Liberal in 1847, and held successively the offices of Financial Secretary to the Treasury, Vice-president of the Board of Trade, and member of the Council of India.

Wilson, John, 'Christopher North,' was born at Paisley on 18th May 1785. He was the eldest son, but fourth child, in a family of ten—his father a rich self-made manufacturer of gauze, his mother, Margaret Sym (1753–1825), a descendant of the great Marquis of Montrose. His earlier education he received at the manse of Mearns, a wild moorland parish of Renfrewshire, till in 1797, shortly after the death of his father, who left him a fortune of £50,000, he was sent to the university of Glasgow. Here he carried off many prizes, wrote essays and verses, and fell in love with one 'Margaret.' In 1803 he went up to Magdalen College, Oxford, as a gentleman-commoner, and soon became notable alike for the splendour of his intellectual gifts and for his supremacy in the various athletic sports—boxing, rowing, running, riding, swimming, &c. A six-foot Apollo, he leapt the Cherwell (23 feet wide), and walked back from London in a single night; withal he was a patron of the cockpit and a winner of the Newdigate (1806) by his prize poem on 'The Study of Greek and Roman Architecture.' Having taken a 'glorious' B.A., and broken off his 'unfortunate attachment,' in 1807 he settled in Westmorland, attracted partly by the beauty of the Lake Country and partly by a desire to cultivate the intimacy of Wordsworth, of whose genius he was already a devout admirer. He purchased the charming little property of Elleray, overlooking Windermere; associated not only with Wordsworth, but with Southey, Coleridge, De Quincey, and the rest; kept a whole fleet of boats on the lake; and would match himself sometimes against the Cumberland wrestlers, one of whom has left it on record that he was 'a vera bad un to lick.'

In May 1811 he married Miss Jane Penny, a Liverpool lady, and now seriously devoted himself to poetry, in 1812 publishing his *Isle of Palms* (written five years earlier), and in 1816 *The City of the Plague*. Both had a fair success; but in 1815 the loss of his whole patrimony through an uncle's unjust stewardship obliged him to give up Elleray and settle with his mother in Edinburgh. He was called to the Scottish bar, but 'knew not what the devil to do' with the few briefs that came to him, so on the starting in 1817 of *Blackwood's Magazine* he proffered his services. They were readily accepted; and it is not too much to say that Wilson and his friend Lockhart (q.v.) were during its earlier years the soul of 'Maga's' success. Lockhart was withdrawn in 1826 to London; and Wilson, though never strictly its editor, became in the eye of the public more and more identified with the magazine; in a certain modified, yet very real sense, for many years he *was* editor. Meanwhile in 1819 he found himself in a position once more to set up house for himself, and in 1820 was elected over Sir William Hamilton to the Edinburgh chair of Moral Philosophy. The contest turned upon politics, and he as a Tory found favour with the town-council; still, though to begin with he knew little or nothing of his subject, and though even as a professor he would sometimes indulge in a 'mill,' he played a more than creditable part, and showed a wonderful power of stimulating the enthusiasm of his students. In 1837 he suffered an irreparable loss in the death of his wife; in 1840 he had a first slight shock of paralysis. He received a pension of £300 a year in 1851, and died on the midnight of 2–3d April 1854 at 8 Gloucester Place, Edinburgh, his home since 1826. He was buried in the Dean Cemetery, and in 1865 a statue of him by Sir John Steell was erected in Princes Street.

Wilson's works, collected and edited by his son-in-law, Professor Ferrier (12 vols. 1855–58), include *Lights and Shadows of Scottish Life* (1822), *The Trials of Margaret Lyndsay* (1823), and *The Foresters* (1825), as well as thirty-nine out of seventy of the 'Noctes Ambrosianæ,' which appeared in *Blackwood's* during 1822–35, and are dialogues named after 'Ambrose's Tavern,' the interlocutors comprising 'Christopher North,' 'Tickler' (his uncle, Robert Sym, 1750–1844), and the 'Shepherd' (Hogg). They in their day and in Scotland enjoyed an amazing vogue, and they are still remembered if not much read, while his poems and tales are well-nigh forgotten. Remembered and yet unread, in spite or because of *The Comedy of the Noctes, selected by John Skelton* (1876), where, if the selections had been the omissions, the result might have been more tolerable. A fine manly, healthy character, a true lover of Nature and Sport, and a first-rate exponent of both, Wilson was all this and something more; but he was not a humorist, though he was always trying to be humorous. Guffaws, not laughter, run through all his writings, which Hallam likened to 'the rush of mighty waters.'

See the Memoir by his daughter, Mrs Gordon (1862); an article by Mr Watts-Dunton in the *Athenæum* (July 8, 1876); Professor Saintsbury's *Essays in English Literature* (1891); Mrs Oliphant's *William Blackwood and his Sons* (1897); and Sir G. Douglas's *Blackwood Group* (1897).

Wilson, John, Indian missionary, was born a farmer's son near Lauder, in Berwickshire, 11th December 1804. Educated at Edinburgh University, he went in 1828 to Bombay as a missionary; and here he laboured—from 1843 under the flag of the Free Church of Scotland—till his death, 1st December 1875. His mastery of the languages of Western India, and grasp of the literature, the

history, the faiths, and the social usages of the races of India, combined with his energy, sagacity, and broad sympathy to give Wilson an unexampled influence. An active promoter of education, legal reform, toleration, and philanthropic movements of every kind, he was much consulted by government, especially during the crisis of 1857. He was twice president of the Bombay branch of the Asiatic Society, and was vice-chancellor of the Bombay University, F.R.S., and Moderator in the Free Church Assembly in 1870. His chief writings were *The Parsi Religion* (1843) and the *Lands of the Bible* (1847). See the Life by Dr George Smith (1878).

His son, ANDREW (1830–81), was born at Bombay, and studied at Edinburgh and Tübingen. He was for three years editor of the *China Mail*, and later of the *Bombay Gazette*, wrote much for *Blackwood* and other serials, but is best known for his account of Gordon's *Ever Victorious Army* (1868) and his book on the Himalayas, *The Abode of Snow* (1875). He also wrote a *Schiller* for the 'Foreign Classics' series.

Wilson, JOHN MACKAY, the originator of the *Tales of the Borders*, was born at Tweedmouth in 1804, failed to make his bread in London, and after writing dramas and poems, and lecturing with much applause but little profit, became in 1832 editor of the *Berwick Advertiser*. But in his days of hardship he had formed habits of intemperance, and after a short illness he died at Berwick-on-Tweed, October 2, 1835. His *Tales* long had a vogue in Scotland not exactly commensurate with their deserts. They were originally issued from Berwick in weekly numbers, beginning November 8, 1834, and in six months had reached a circulation of 30,000. Wilson worked unaided till the end, but thereafter the *Tales* were continued for his widow's behalf by Sutherland, an Edinburgh bookseller, who employed Alexander Leighton (1800–74) as editor. Among the writers were Leighton, [Sir] Theodore Martin, Hugh Miller, 'Delta,' Professor Thomas Gillespie, and James Maidment.

The *Tales of the Borders* were first collected in six quarto volumes (1835–40). A new edition, revised by Leighton, extended to 20 vols. (Manchester, 1857–59); his 1869 revision contained four volumes more.

Wilson, RICHARD, landscape-painter, was born at Penegoes rectory, Montgomeryshire, 1st August 1714. After studying under a London portrait-painter (1729–35), he took to portrait-painting on his own account, but during a six years' visit to Italy (1749–56) was advised to forsake portrait for landscape. To landscape-painting he now exclusively devoted himself; and before returning to England he had succeeded at Rome in establishing a considerable reputation. In London in 1760 he exhibited his great picture, the 'Niobe,' and at once secured rank as one of the first painters of his time. Another celebrated work was his 'View of Rome from the Villa Madama.' Failing, however, to hit the general taste, he fell into the hands of the picture-dealers; and so straitened did he frequently find himself that in 1776 he was glad to obtain the appointment of Librarian of the Royal Academy. By the death of a brother he came into a small estate at Llanferras in Denbighshire, and retiring there died some few years after in 1782. Of his numerous pictures, now much prized, many were engraved by Woollett and others; the National Gallery contains nine specimens of his work.

Wilson, GENERAL SIR ROBERT THOMAS, was born in London in 1777, had his education at Westminster and Winchester, and when scarcely seventeen joined the 15th Light Dragoons, and saw some sharp service in Belgium. In 1798 he was engaged in Ireland in the suppression of the rebellion, next served in the unfortunate campaign of the Helder, commanded Sir Ralph Abercromby's cavalry in Egypt, took part in the conquest of the Cape of Good Hope in 1806, and next went abroad on the staff of Lord Hutchinson, who was sent on a mission to the king of Prussia, then a fugitive from his capital. He witnessed the desperate battle of Eylau, and on the peace of Tilsit returned to England. He was next sent to the Peninsula, helped to train the Portuguese army, and under Wellington commanded a Spanish brigade at Talavera. In 1812 he was attached to the Russian army as English military commissioner, and during the struggle which resulted in the capture of Moscow, and the pursuit of the doomed French army, he rendered important service both in council and in the battlefield. Throughout subsequent campaigns in Germany and in France he was present in a similar capacity in the camp of the allies, and at Lützen he took command of the Prussian reserve. After the peace he became involved in the unfortunate matter of Queen Caroline, and was dismissed the army, but afterwards reinstated. In 1841 he attained the rank of general; from 1842 to 1849 held the post of governor of Gibraltar; and from 1818 to 1831 sat in the Liberal interest for Southwark. He died suddenly in London, 9th May 1849.

He wrote a *History of the British Expedition to Egypt*—the source of the horrible charge that Napoleon poisoned his sick at Jaffa; *Inquiry into the Present State of the Military Force of the British Empire* (1804); *Campaigns in Poland, with Remarks on the Russian Army* (1810); and *Sketch of the Military Power of Russia* (1817). His *Private Diary* during his foreign campaigns was edited by his nephew and son-in-law, the Rev. Herbert Randolph (2 vols. 1861), who also prepared a Life (2 vols. 1863).

Wilson, THOMAS, English divine and saint, was born at Burton in Cheshire, September 20, 1663, made his studies at Trinity College, Dublin, and served as curate of Newchurch Kenyon from 1686 till 1692, when he became chaplain to the Earl of Derby, who appointed him Bishop of Sodor and Man in November 1697. For fifty-eight years he governed his diocese with constant care, and entered into his rest on March 7, 1755. His *Principles and Duties of Christianity* (1707), commonly called the Manx Catechism—the first book printed in the native tongue—and his *Essay towards an Instruction for the Indians*, written for Oglethorpe's Georgia plantation scheme, and submitted to Isaac Watts (published only in 1740), were combined to form *The Knowledge and Practice of Christianity made easy to the Meanest Capacities* (1755). But his name best survives in his admirable *Short and Plain Instructions for the Better Understanding of the Lord's Supper* (1736), and *Sacra privata, Private Meditations, Devotions, and Prayers* (1800). Other books are *Parochialia, or Instructions for the Clergy* (1788), and *Maxims of Piety and Christianity* (1789). He instituted a Manx translation of the Bible, which was completed 1772–75. The first collection of Bishop Wilson's works was made by the Rev. C. Cruttwell (Bath, 1781); the best is that by Keble in the 'Library of Anglo-Catholic Theology' (Oxford, 7 vols. 1847–52), with a prolix Life, itself reprinted (2 vols. 1863).

Wilton, a market-town of Wiltshire, at the confluence of the Nadder and Wyly, feeders of the Avon, 3¾ miles WNW. of Salisbury. The ancient capital of Wessex, it gave name to the county, and was the scene of Alfred's first battle as king with the Danes (871), and the seat of a bishopric (909–1050), but after 1244, when it had twelve churches, declined through the diversion of the great western

road. The present church, erected in 1844 by Lord Herbert of Lea at a cost of £20,000, is an ornate Lombardic structure, with a wealth of marbles, mosaics, and stained glass, and a campanile 108 feet high. On the site of a Saxon nunnery is Wilton House, the seat of the Herberts (q.v.), where Sidney wrote part of the *Arcadia*. It is famous for its Van Dycks and other art-treasures, and for the beauty of its grounds. Since Elizabeth's reign Carpets (q.v.) have been manufactured at Wilton, which is a municipal borough, first chartered by Henry I., and reformed in 1885. It returned two members till 1832, and then one till 1885. Pop. 2120.

See the *Registrum Wiltunense* (Lond. fol. 1827), and James Smith's *Wilton and its Associations* (Sal. 1851).

Wiltshire is an inland English county, bounded on the N. by Gloucestershire and Berkshire, on the E. by Berks and Hampshire, on the S. by Hants and Dorsetshire, and on the W. by Somersetshire and Gloucester. Its greatest length, north to south, is 54 miles; its greatest breadth, east to west, is 37; and the area is 1354 sq. m. or 866,677 acres. Pop. (1801) 183,820; (1841) 256,280; (1881) 258,970; (1891) 264,969. This unusually small proportion of inhabitants is due to the presence of extensive tracts of open pasture-land in the centre and north of the county—Salisbury Plain and the Marlborough Downs. The river systems of the county divide near Devizes, whence the Lower or Somersetshire Avon, entering Wilts from Gloucester, flows to the Severn below Bristol; the Southern or Hampshire Avon flows by Salisbury to the English Channel at Christchurch; and the Kennet flows to join the Thames at Reading, thence to the German Ocean. The chief Wiltshire feeders of the Lower Avon are the Newnton, Merden, Broughton, and Whaddon; and of the Southern Avon, the Wyly (joined by the Nadder at Wilton) and the Bourne. By far the larger portion of the county is occupied by Chalk. This forms in the main a great upland separated by a broad hollow of Greensand, ranging by Devizes to Burbage, into the Marlborough Downs and Salisbury Plain, and rising on the Berkshire border into the highest point of the English Chalk, Inkpen or Hackpen Beacon (972 feet). Greensand also borders the Chalk north and west, and is succeeded by a band of Oolite exposing the Purbeck and Portland beds, the Kimmeridge Clay, Coral Rag, and Oxford Clay—the latter ranging from Frome, by Bradford, Chippenham, and Malmesbury. London and Plastic Clay and Bagshot Sands extend somewhat into the county from Berks and Hants; and there are Quaternary gravels near Salisbury and Melksham. The Wiltshire Oolites are in parts highly fossiliferous, and at points yield valuable building-stone—as at Fonthill, Tisbury, Chilmark, Swindon, Corsham, and Box. Iron ore was worked and smelted in the county in remote antiquity, but of late only in the vicinity of Seend, and since of Westbury, the upper beds of the Coral Rag there consisting of oolitic grains of hydrous oxide of iron cemented by calcareous matter. The railways are connected with the Great Western and London and South-Western systems, and the former company has extensive works at Swindon (q.v.). The industries are chiefly agricultural—dairy-farming predominating in the north, and grazing in the south. Large flocks of sheep feed on Salisbury Plain. There are extensive factories at Calne, which send out the Wiltshire bacon. There is also an important manufacturing element—Bradford and Trowbridge still maintain the old reputation of the West of England for the highest quality broadcloths; and the Wilton carpets are made at the town of that name. Marlborough is the seat of a great public school. The flora is noteworthy, and includes a number of rare plants. Though the rolling open country is as a rule monotonous and tame, there is much charming scenery in the valleys and amongst the broken hill districts, especially of its western borders; while there are fine stretches of woodland connected with its numerous seats—especially at Savernake, Bowood, Longleat, Wardour, and Wilton. Savernake Forest and Cranbourne Chace, indeed, have undergone little change for centuries. Wiltshire was well settled by the Romans, and played a prominent part in early Saxon days; and the defeat of the British by Cynric at Old Sarum in 552 was the first important Saxon success. Four years later the victory of Cynric and Ceawlin at Barbury included the shire in the West Saxon kingdom, of which Wilton eventually became the capital. At Wilton Alfred suffered his first defeat from the Danes; and Edington, near Westbury, is suggested as the Ethandune where he defeated Guthrum. Wilton was the scene of another battle of note in the wars of Stephen and Matilda, when the presence of numerous castles and garrisons brought great suffering on the inhabitants of the district generally. The early importance of Wilton—itself named from the river Wyly—caused it to give name to the county as Wiltonscire. Waller's defeat at Roundway Hill, Devizes, and the gallant defence of Wardour Castle by Lady Arundell were the chief local episodes of the Great Rebellion. The civil record of Wilts is peculiar. Before 1832 it sent thirty-four members to parliament, including two from Old Sarum, which had neither house nor inhabitant. Old Sarum, Downton, Great Bedwyn, Heytesbury, Hindon, Ludgershall, and Wootton Bassett were then swept away, Calne, Malmesbury, Wilton, and Westbury reduced to one each, and the total made eighteen. Till 1867 the number of members was eighteen, then till 1885 fifteen, and now it is six only—five for county divisions and one for Salisbury. The municipalities are Calne, Chippenham, Devizes, Malmesbury, Marlborough, Salisbury, and Wilton.

From the standpoint of the archæologist Wilts is the premier county in England. Stonehenge has been famed for ages throughout the civilised world. Still more remarkable are the less-known, much-ruined megalithic circles and avenues of Avebury—'as much excelling Stonehenge as a cathedral doth a parish church'—while Silbury Hill, near by, is the largest tumulus in Europe. Barrows of various kinds so abound that it was in Wiltshire barrow-digging first became a science. Relics of palæolithic man are yielded by the river gravels near Salisbury and elsewhere; and thence downward human representation may be regarded as complete. Earthworks, like barrows, are exceptionally numerous. The Wansdyke stretches across the north of the county for miles, traversing the Marlborough Downs. Grimsditch intersects the south of the county near Downton. The huge ramparts of Old Sarum are unique in their record of successive occupation on English soil—in turn the stronghold of Celt, Roman, Saxon, Norman, and seat of the see until Salisbury was founded in the lowlands by the river. Bradford-on-Avon contains the most perfect Anglo-Saxon church in existence. Salisbury Cathedral is the noblest illustration of the Early English style. The Norman castle of Devizes was unmatched in England, but neither of that nor of its sister fortalices are there many traces left. There is magnificent Norman work in the remains of Malmesbury Abbey. Domestic buildings of the 14th and 15th centuries are numerous and good. Longleat has been regarded as the finest Elizabethan mansion in the kingdom. Among modern structures the most

remarkable is the Lombardic church at Wilton built by the first Lord Herbert of Lea.

See the articles AVEBURY, SALISBURY, STONEHENGE, WHITE HORSE, &c.; works by John Aubrey (ed. by Rev. J. E. Jackson, Devizes, 1862), Sir R. C. Hoare (8 vols. 1812–44), John Britton (3 vols. 1801-25), H. Moody (Winchester, 1851), J. E. Jackson (2 vols. 1867–72), W. H. Jones (3 vols. 1865–80), E. Kite (Devizes, 1880), Stratford (1882), R. Jefferies (*Life in a Southern County*, 1882), A. C. Smith (1884–85), and the present writer, R. N. Worth (1887), besides the *Wilts Archæological and Natural History Magazine* (since 1853).

Wimbledon Common, an open, breezy heath of 628 acres, 7 miles SW. of London. Here from 1860 till 1889 in July was held the annual meeting of the National Rifle Association, since transferred to Bisley near Woking. Linnæns here first saw the gorse in bloom; and here many duels were fought. Wimbledon now is practically a suburb of London, with a number of magnificent houses. Pop. (1871) 9087; (1891) 25,758.

Wimborne, a market-town of Dorsetshire, at the confluence of the Allen and Stour, 7 miles N. of Poole and 2½ E. of Dorchester. Here, about 705, St Cuthburh, King Ine's sister, founded a nunnery, which Edward the Confessor refounded as a collegiate church—the noble cruciform minster, Norman to Perpendicular in style, with a central and a west tower, and the tomb of Ethelred I. There is also a grammar-school (1496; refounded 1563). Coach-building and the manufacture of buttons and woollen hose give employment. Pop. of parish, 5400. See works by P. Hall (1853) and Yeatman (1878).

Winchelsea, a decayed Cinque Port of Sussex, affiliated to Hastings, is 2 miles SW. of Rye by rail, and from 1832 to 1885 was included in the parliamentary borough of Rye. The present ancient city, which has a population of about 1000, is New Winchelsea. Old Winchelsea, often named in the history of the 11th, 12th, and 13th centuries, stood 3 miles SE., but was often inundated by the sea, and finally submerged and destroyed in 1287. New Winchelsea was built on a remarkably regular quadrangular plan under the immediate auspices of Edward I. Of the old church of St Thomas, which dates from 1300, the chancel with aisles and part of a transept remains, containing some fine canopied tombs. Parts of a Franciscan monastery are to be seen; and three of the gateways of the fortified city remain. The town gives an earl's title (in the form Winchilsea) to the family of Finch-Hatton, a title now conjoined with that of Earl of Nottingham.

See CINQUE PORTS; the *English Illustrated Magazine* for 1890; and F. A. Inderwick, *The Story of King Edward and New Winchelsea* (1892).

Winchester, the city of Hampshire, is situated on the Itchen, 60 miles WSW. of London. It originated, as some other towns, in a tribal settlement placed for safety on the summit of a hill. As the settlers became more numerous they descended the slope (St Catherine's) to the more convenient plain, which, in contradistinction to their former abode, they named 'Gwent,' or the hollow. The monoliths here found, and called 'druidical,' were probably brought down into the valley by drifts in early ages. The Romans, on coming up the river, observed the advantages of the site, took possession of the town, and formed its future plan. They made it rectangular, the main streets crossing at right angles, and the principal one corresponding with the present High Street. Alongside of the wattled huts of the 'Belgæ' soon grew up city walls, temples (to Apollo and Concord), and other evidences of southern civilisation. A head college for flamens was established, and, if the record be true, the first Christian church in Britain was built here, 169 A.D. Tesselated pavements and many relics of this interesting period are preserved in the museum of the new guildhall, while the walls of Wolvesey are studded with Roman bricks and drums of columns. The church was converted into a 'temple of Dagon' (Woden?) by the Saxons, 495 A.D. The Romans spelt the name *Venta;* but perhaps the old pronunciation survived. The Saxons restored the form in *Wintanceastre.*

The palmy days of Winchester, when it disputed with London the claim to be the capital of England, were during the last three Saxon and first two Norman centuries. Early in the 7th century an Italian monk, Birinus, converted King Cynegils, whose son gave all the land as far as 7 miles round Winchester—some of it is still held by the dean and chapter—for the establishment of a new church. Moreover, the palatial fortress of Wolvesey was the royal residence of the kings of Wessex, which became England. Alfred the Great, educated here at the Prior's School, resided during his long reign at Winchester, of which his tutor St Swithun (see SWITHIN) was a native and afterwards a bishop. At Wolvesey his scribes compiled the 'Anglo-Saxon Chronicle,' the first English prose book, assisted by the king himself, who ordered that the volume should be kept there; it is now in Corpus Christi College, Cambridge. His queen founded St Mary's nunnery here—the site now marked by Abbey House—in which her daughter in pious humility washed the nuns' clothes. Alfred also founded the 'New Monastery,' afterwards called from his favourite master, 'St Grimbalds.' After the king's death the monks by trickery obtained his body, which had been buried in the adjacent monastery of St Swithun's, and, becoming also possessed of the bones of St Josse, caused a rich stream of miracles to flow forth. Cnut (Canute) presented them with a great cross, containing sixty pounds of silver and fifteen of gold. But in Edgar's reign a cathedral had arisen which far surpassed this or any other ecclesiastical edifice in England. Bishop Æthelwold, with Dunstan, introduced the stricter monasticism, but was not above using a 'vocal cross' and disregarding the rights of property. He erected a magnificent building, which had numerous altars, a tremendous organ, a lofty tower with golden gargoyles and balls like stars, a marvellous weathercock, and a crypt which became the burial-place of kings and bishops. But chief attraction here was the body of St Swithun and the miracles it produced.

The abbot of the 'New Monastery,' being Harold's uncle, went in arms with some of the monks to the battle of Hastings. William was greatly displeased, and when he built his palace at Winchester, which extended from the present Butter Cross to Minster Street and Lane, the monks were so much circumscribed that they were glad to move across to Hyde Mead, on the north-west of the city. This took place in 1110, and thirty years afterwards the abbey was destroyed by fire-balls from Wolvesey. Bishop de Blois, who had rebuilt that castle and filled it with art-treasures—some ruins remain—sided with his brother Stephen in his conflict with Matilda in 1141, when the south of Winchester supported the king and the north the empress. The fight raged for seven weeks in the heart of the city. The monastery was soon afterwards rebuilt; in 1390 the abbot was mitred, and at the dissolution the silver was calculated to be worth 2000 marks. In 1788 a bridewell was constructed out of the ruins, but portions of St Bartholomew's Church appear to be old. Beneath the east window lie the bones of five persons found here in 1867, and supposed to be those of King Alfred, his queen, two sons, and St Grimbald.

The castle of Winchester is said to have been built by order of the Conqueror, and certainly was in existence in the reign of Henry I. The Norman castle consisted of a tower 52 feet square, and had walls 14 feet thick. Here was kept for some years the celebrated Domesday Book; here Earl Godwin died suddenly at a banquet, for his sins it was said, and here in 1097 Anselm and Walkelin had a fierce contest about the claims of pope and king. The succeeding castle had round towers 30 or 40 feet wide, with walls from 8 to 10 thick, and had subterranean passages radiating in three directions. Henry III. ('of Winchester') was born here, and resided in the castle, which was then decorated with mural painting, statuary, and marble pillars. It had also a Mappa Mundi and Wheel of Fortune —the latter may have been turned into 'Arthur's Round Table,' which now hangs in the hall. Owing to a confusion between this Gwent and the one in Monmouthshire, Arthur's legends were transferred to Winchester, probably before Henry II.'s time, and this mistake caused Henry VII. to give the name of that hero to his eldest son, who was born in this castle. We first hear of the Table in Henry VI.'s reign; Henry VIII. showed it to Charles V., and it has not been repainted since. On the parapet of this castle Edward I. fixed a quarter of the last native Prince of Wales; Isabella there spiked the head of Despencer Earl of Winchester, and she had Edmund of Woodstock decapitated on the green below. Here Raleigh, after his trial at Wolvesey, was imprisoned, and several of his companions were beheaded. The castle had become much dilapidated before the Cavaliers took refuge here—soon to surrender to Waller. The city and castle were retaken by the royalists, but finally yielded to Cromwell, who was here in person in 1645. One tower of the castle remains, with the fine hall 110 feet long, adorned with pillars of Purbeck marble. For 400 years after the Conquest the parliaments of England occasionally sat in it, and now it is used as a law-court. Hard by stands the red brick palace of Charles II., now a barrack.

The fantastic cathedral of the Saxons did not accord with Norman ideas, and Bishop Walkelin, a kinsman of William, demolished it, and built (1079–93), partly perhaps on the same site, a dark and ponderous pile. He commenced two western towers, the foundations of which have been traced. The central tower fell in 1107, but was soon rebuilt. As there are no quarries near Winchester, the stone for this and for the castle was brought from the Isle of Wight. This great edifice forms the substantial part of the present cathedral, and is visible in places. The Early English retro-choir still exists, built by Bishop de Lucy seventy years later. But 250 years produced dilapidations, and Bishop Edington commenced to renovate in the Perpendicular style, building the west porch and three windows in the aisles. Wykeham, his successor, carried on the work, finished the south aisle, and began the north. He pulled down the heavy triforium, and carried the pillars up to a great height, casing the round Norman ones; replaced the small round-headed clerestory windows with large pointed lights, and added an arched stone-groined roof, producing by this transformation the finest Perpendicular nave extant (see Vol. VIII. p. 59). The work was completed by Cardinal Beaufort and Bishop Wayneflete. Specially interesting are the monuments and unrivalled chantries in this cathedral. In the centre of the choir stands an ancient tomb, said to be that of Rufus, but more probably that of De Blois. We may also notice those of Bishops de Lucy, De la Roche, Edington, Wykeham, Cardinal Beaufort, Wayneflete, Langton, Gardiner, Fox, North, Jane Austen, and Izaak Walton. The resting-places of the Saxon kings and bishops are unique—coffers perched on the partition walls of the choir. This collection was commenced by Bishop de Blois—two of whose chests remain, and was completed by Bishop Fox, but some of the names are probably not correctly inscribed. In the Civil War the soldiers pillaged the cathedral, and, knocking down the chests on the north side, scattered the bones and used them for breaking the windows. This cathedral is the longest in England (520 feet) except Canterbury, which exceeds it by five feet. It has an ancient sculptured font said to have been presented by De Blois. In the library are some Anglo-Saxon charters, 12th-century books, bishops' rings, and other treasures. Walkelin obtained from Rufus the right of holding a fair on St Giles' Hill, which became the greatest but one in England.

A great impulse was given to education when in 1369–93 Winchester College was founded here by Wykeham. Some monks had previously given instruction, but nothing on a grand scale had been attempted. This foundation, called the 'New College,' was original in that it was non-monastic, and was in connection with a college at Oxford. It was intended for priests, and especially for those of limited means. The building, placed in the Soke or Liberty, a district under episcopal jurisdiction, was protected by the vicinity of the cathedral, monastery, watch-house, and Wolvesey Castle, but the site was so marshy that it was partly erected on piles. This edifice is that at present existing, with the exception of the chantry chapel, schoolroom, and tower. At the entrance of the kitchen stands the picture of the Trusty Servant —the present costume is that of the 18th century, though the picture is supposed to have been placed here by Johnson, head-master in 1560, and is a copy from the French. The hall is magnificent, 53 feet in length, with oak panelling and fittings. Here little flat squares of board, formerly the dinner plates, are still used for bread and butter. In the schoolroom, built by Warden Nicholas (1687), stands the celebrated signboard painting, as old as the middle of the 15th century, informing the schoolboy that he must learn, leave, or be flogged with a four-twigged rod. The foundation was for a warden, ten fellows, three chaplains, an usher, and seventy scholars. In 1857 the fellowships were reduced to six. Here the system of 'monitors' originated, and they alone, about twenty, were allowed to have fags: servants now do most of the fagging. Until the middle of the 16th century the boys' beds consisted of some straw thrown on the concrete floor. There were always some boys who were not on the foundation, and as they increased 'Old Commoners' was built in 1730 for their accommodation. Dr Moberly built in 1838 the present head-master's house, new halls and dormitories. The last-named are now class-rooms, and the commoners are lodged in nine tutors' houses, each containing thirty-four boys, two or three in a room. The expenses of a commoner amount to about £150 a year. The number of boys in the school is now about 450. Those on the foundation are elected between twelve and fourteen years of age by competition. There are several exhibitions and scholarships varying from £25 to £50 a year, and three gold medals. A rifle corps was established in 1860; there is a little boating, and a football game peculiar to the school; an annual cricket match is played with Eton. Many great men have been educated at Winchester, as Archbishops Warham and Howley, Sir Thomas Browne, Bishop Ken, the poets Collins, Warton, Young, Otway, and Bowles, Lowth of the Commentaries, Lemprière of the Dictionary, Dr Arnold of Rugby, Sydney Smith, and Lord Sherbrooke.

There are two hospitals in Winchester dedicated to St John, and said to have been founded by Birinus; one has been lately rebuilt, the other has a fine hall belonging to the corporation, and some Decorated windows. Portions of the city wall, mostly built in the reigns of John and Henry III., still remain, and two of the gates. Several of the town houses are ancient; the Butter Cross dates from Henry VI.; and close to it an old clock projects over the High Street in front of the former guildhall. The city once extended to St Cross, Wyke, Worthy, and Magdalen Hill, and in the reign of Henry I. had 20,000 inhabitants, but declined so much after being sacked in 1265 that it has hardly yet regained that amount, the pop. being 13,704 in 1851, and 19,073 in 1891. A free library was established here in 1877. A mile distant stands the interesting hospital of St Cross, founded in 1132 by De Blois, partly from the spoils of Hyde Abbey; but nearly all the present buildings were erected by Cardinal Beaufort.

See also WYKEHAM.

Winchester, capital of Frederick county, Virginia, in the valley of the Shenandoah, 87 miles WNW. of Washington. During the civil war it was the scene of frequent conflicts, and occupied in turns by the Federal and Confederate armies. Pop. 5196.

Winchilsea, ANNE FINCH, COUNTESS OF, poetess, was daughter of Sir W. Kingsmill of Sidmonton near Southampton, and wife of Heneage Finch, who succeeded as fourth earl in 1712. She was a friend of Pope, Rowe, and other poets, and herself wrote fair poetry—her longest poem, on 'Spleen,' in Cowley's manner, was printed in Gildon's Miscellany in 1701. Her 'Miscellany Poems, written by a Lady,' appeared in 1713, and she herself died in 1720. Wordsworth (preface to 1815 volume) commends her delightful pictures of external nature, and Mr Gosse (*Gossip in a Library*, 1891) discovers her to have had a genuine vein of poetry.

Winckelmann, JOHANN JOACHIM, first appreciative critic and historian of Greek art, was born of poor parents, 9th December 1717, at Stendal in Prussian Saxony. After studying for a time at a gymnasium in Berlin, he went in 1738 to the university of Halle as a student of theology, which he gave up for the study of medicine and mathematics at Jena. For a time a private tutor, and then rector of a school, as librarian by Count von Bunau he was taken to Nöthnitz, close to Dresden. He had frequent opportunities of inspecting the famous treasures of art accumulated there; he also made the acquaintance of artists and distinguished dilettanti; and the enthusiasm was awakened which determined his subsequent career. To the theory and history of art he now resolved to devote himself; and on being thrown into the society of the pope's nuncio, Cardinal Archinto, he was induced, after some hesitation, to become a Roman Catholic, on a promise of an appointment being procured for him which would enable him to proceed to Rome. Thither as librarian to Cardinal Passionei he repaired in 1755, having previously published at Dresden a treatise on the imitation of the antique (1754) which secured him a small pension from Augustus III. of Saxony. At Rome he prosecuted his studies with the utmost ardour, and every facility was afforded him. In 1758 he visited Naples to examine the celebrated remains of Herculaneum, Pompeii, and Pæstum, and went also to Florence for the purpose of cataloguing the famous collection of antique gems belonging to Baron de Stosch, a labour which occupied him for nine months. Soon after Cardinal Albani appointed him his librarian. The first-fruits of his studies in Italy appeared in his treatise on ancient architecture (*Über die Baukunst der Alten*, 1762), and two years afterwards the great work of his life, on which he had long been engaged, the History of Ancient Art (*Geschichte der Kunst des Alterthums*), was issued from the press of Dresden. This exposition of the principles and history of Greek art may fairly be described as epoch-making, not for Germany merely but for Europe; and if in many points corrections and modifications of his statements have been made, all subsequent progress in æsthetics is largely an outcome of this work, which from the very first was studied with avidity by men like Goethe and Lessing. Winckelmann also gave to the world the result of his researches at Herculaneum, and in 1766 his *Monumenti Antichi Inediti*, an elaborate work with plates, besides an allegory and many contributions to the periodicals of the time. In 1763 he was made superintendent of all antiquities in and about Rome. In 1768 Winckelmann, by this time famous throughout Europe, set out to revisit Germany. His destination was Berlin; but after visiting Munich and Vienna (where he was received with flattering attentions by Maria Theresa), he resolved to return to Rome. On the way thither he was murdered in a hotel at Trieste (8th June 1768) by a fellow-traveller, Arcangeli, to whom he had shown some tempting gold coins and curios.

An edition of his works appeared in 1808–20; the fullest is that by Eiselein (12 vols. 1825–29). See the Life by Justi (2 vols. 1866–73). There are busts or monuments of Winckelmann in Stendal, Rome, and Berlin; and an annual memorial celebration takes place at Rome and several of the German universities.

Wind is air in motion. The force of the wind is measured by Anemometers (q.v.), of which some measure the velocity, and others the pressure. The following are a few velocities of wind, translated into popular language: 7 miles an hour is a gentle air; 14 miles, a light breeze; 21 miles, a good steady breeze; 40 miles, a gale; 60 miles, a heavy storm; and 80 to 150 miles, a hurricane sweeping everything before it. A few of the accepted comparisons of velocity and pressure may be added: 5 miles an hour represents a pressure of 2 oz. on the square foot; 10 miles, ½ lb.; 20 miles, 2 lb.; 30 miles, 4½ lb.; 40 miles, 8 lb.; 51 miles, 13 lb.; 60 miles, 18 lb.; 70 miles, 24 lb.; 80 miles, 32 lb.; and 100 miles, 50 lb. During a great storm in 1867 the pressure was 35 lb., the velocity 83 miles. In the Tay Bridge storm (December 1879), which travelled at rates varying from 40 to 70 miles an hour, the velocity of some gusts reached 96 or even 150 miles. The British Association Committee on Wind-pressure have reported cases of 80 and 90 lb. to the square foot; but the whole question of the relation of velocity to pressure cannot yet be regarded as ascertained.

Seamen more than landsmen require to pay attention to variations in the strength of the wind, as well as in its direction, and to adopt such phrases as will render that strength generally intelligible. *Anemometers*, used on land for this purpose, are unsuited to the requirements of seamen, who have found it convenient to divide winds into twelve kinds, in relation to strength, designated thus: *Faint air*, *light air*, *light breeze*, *gentle breeze*, *fresh breeze*, *gentle gale*, *moderate gale*, *brisk gale*, *fresh gale*, *strong gale*, *hard gale*, and *storm*. This classification was determined in

1806 by Beaufort according to the amount and kind of sail which one of the ships of the royal navy could safely carry at the moment. These estimates of the wind's force by the scale 0 to 12 mean that 0 represents a calm and 12 a hurricane.

All wind may be regarded as due directly to differences of atmospheric pressure at the same level above the sea as observed at different places; these in their turn being ultimately referable to differences of temperature, and, in a less degree, to differences of humidity. Thus, if the temperature of two adjacent regions become, from any cause, unequal, the air of the warmer, being lighter, will ascend and flow over on the other, whilst the heavier air of the colder region will flow in below to supply its place. Hence a difference in the temperature of the two regions gives rise to two currents of air—one blowing from the colder to the warmer along the surface of the earth, and the other from the warmer to the colder, in a higher stratum of the atmosphere; and these currents will continue to blow till the equilibrium be restored. Winds are classed as Constant, Periodical, and Variable Winds.

Constant Winds.—The Trade-winds.—When the surface heated is, roughly speaking, a whole zone, as occurs in the tropics, a surface-wind will set in towards the heated tropical zone from both sides, and uniting ascend, and then separating flows as an upper current in opposite directions. Hence a surface-current will flow from the higher latitudes towards the equator, and an upper current towards the poles. If, then, the earth were at rest, a north wind would prevail in the northern half of the globe, and a south wind in the southern half. But these directions are modified by the rotation of the earth on its axis from west to east. In virtue of this rotation, objects on the earth's surface at the equator are carried round toward the east, at the rate of 17 miles a minute. But as we recede from the equator this velocity is continually diminished; at 60° lat. it is only 8½ miles a minute, or half of the velocity at the equator; and at the poles it is nothing. A wind, therefore, blowing along the earth's surface towards the equator is constantly arriving at places which have a greater velocity than itself. Hence it will lag behind—i.e. will come up against places towards which it blows, or become an *east* wind. Since, then, the wind north of the equator is under the influence of two forces—one drawing it south, the other drawing it west—it will, by the law of the composition of forces, flow in an intermediate direction—i.e. from north-east to south-west. Similarly in the southern tropic the wind will blow from south-east to north-west. All observation confirms this reasoning. From the great service these winds render to navigation they have been called the Trade-winds. It is only in the Pacific and Atlantic oceans that the trade-winds have their fullest development. In other parts of the trades' zones, such as southern Asia and intertropical Africa and America and adjoining oceanic regions, they are more or less diverted from their course by the unequal distribution of land and sea (on which see MONSOON and METEOROLOGY). In the Atlantic the *North Trades* prevail between 9° and 30° lat., and in the Pacific between 9° and 26° lat.; and the *South Trades* in the Atlantic between 4° N. and 22° S. lat., and in the Pacific between 4° N. and 23½° S. lat. These limits, however, are not stationary, but follow the sun, advancing northward from January to June, and southward from July to December.

The Region of Calms is a belt, 4° or 5° lat. broad, stretching across the Atlantic and Pacific, approximately parallel to the equator. It marks the meeting-region of the north and south trades. Here also occur heavy rains, and thunderstorms almost daily. This belt varies its position with the trades, reaching its most northern limit in July, and its most southern in January. The trade-winds are more strongly marked in the Atlantic than in the Pacific Ocean; indeed, in the western part of the Pacific, to the east of Japan and the Philippine Islands, they are but obscurely marked at all seasons. When the belt of calms nears the African coast, in the Gulf of Guinea, the copious rainfall gives rise to the strong steady-blowing gales of that coast, called *Tornadoes* and *Hurricanes*. In nautical parlance the *doldrums* may be either the region of calms or the calms characteristic of it.

Periodical Winds.—Land- and sea-breezes are the most general, as well as most readily explained, of the periodical winds. On the coast, within the tropics, a breeze sets in from the sea in the morning, at first a mere breathing on the land, but gradually it increases to a stiff breeze in the heat of the day, after which it sinks to a calm towards the evening. Soon after a contrary breeze springs up from the land, blows strongly seaward during the night, and dies away in the morning, giving place to the sea-breeze as before. These winds are caused during the day by the land becoming more heated than the sea, consequently the air over it ascends, and the cool air from the sea flows over on the land to supply its place; and during night, by the temperature of the land falling below that of the sea, when the air, becoming thereby heavier and denser, flows over the sea as a land-breeze. It is within the tropics that sea-breezes are most marked and constant, because there the sun's heat is strongest, and atmospheric pressure is practically uniform, except in those rare instances where it is disturbed by the passage of cyclones. But in countries such as Great Britain, where atmospheric pressure is most commonly greater or less than that of surrounding regions, the strength of the wind blowing from the high to the low barometer is far stronger than that which would result from the disturbance caused by the unequal heating of land and water; and consequently the sea-breeze is not then felt. In the warm months, however, at those times when barometers are nearly uniform over northern and western Europe, there is a gentle sea-breeze all round Great Britain during the heat of the day, and a land-breeze during night. Thus on the coast of Berwickshire during fine settled summer weather, when the temperature of the land is much warmer than that of the sea during the day, in the morning the wind is north-west till about 10 A.M., when it veers to north, falling all the time till finally it sinks to a calm. A little before noon it springs up from north-east or east, veers to south-east from 2 to 3 P.M., where it continues till 7 P.M., when it veers to south and south-west, and gradually sinks to a calm. About sunset it springs up from west and veers to north-west during the night, where it continues till next morning. On the other hand, on the west coast of Scotland north-west winds diminish in force toward sunset, giving rise to the weather saw, 'The west wind is a gentleman and goes to bed.' Quite analogous to the land- and sea-breezes are the monsoons, which, as regards southern Asia, are only the north trades drawn out of their course in summer by the heated land-regions—the south-west monsoon being really only a vast sea-breeze blowing on southern Asia, and lasting several months of the year.

Variable Winds depend on purely local or temporary causes, such as the nature of the ground, covered with vegetation or bare; the physical configuration of the surface, level or mountainous; the vicinity of the sea or lakes;

and the passage of storms. Within the tropics all except the last of these is borne down, or all but borne down, by the great atmospheric currents, which prevail there in all their force. But in higher latitudes this is not the case; these, therefore, are the regions where variable winds prevail. The most noted of these winds are the Simoom, Sirocco, Solano, and Harmattan. The *Bora* (q.v.) is a cold tempestuous wind, blowing from the Alps down on the Adriatic; and the *Gregale* is a peculiarly cold, parching, and unhealthy wind which in spring and early summer descends on Malta from Greece. The *Puna Winds* prevail for four months in the year in a high barren tableland in Peru called the Puna; as they are probably part of the south-east trade-wind, after having crossed the Andes they are drained of their moisture, and are consequently among the most dry and parching winds that occur anywhere on the globe. In travelling over such regions it is necessary to protect the face with a mask from the glare and heat of the day, and from the intense cold of the night. The *East Winds* which prevail in the British Islands in spring are part of the great northern current which at that season frequently descends from northern over southern Europe. Their origin explains their dryness and unhealthiness. It is a prevalent notion that the east winds in Great Britain are damp. It is quite true that many easterly winds are peculiarly damp; all that prevail in the front part of Storms (q.v.) are damp and rainy, these being simply an indraught of the air towards the low barometer which is advancing from the west at the time; and it is owing to this circumstance that in the east of Scotland the greater part of the annual rainfall falls with easterly winds. All of these damp easterly winds, however, soon shift round to some westerly point. But the genuine east wind, which is the dread of the nervous and of invalids, does not shift to the west, and is specially and intolerably dry. In the third week of May 1866 this character was strongly marked, when at many places in Scotland the humidity was only 40, and on some occasions as low as 29; the degree of this dryness will be appreciated when it is stated that the mean driest month during many years showed a humidity only of 73, saturation being 100. While this wind lasted, the daily range of temperature was double the usual amount, the soil was parched, and the leaves of trees and plants were blackened and destroyed. Deaths from brain-diseases and consumption reach the maximum in Great Britain during the prevalence of east winds. The *Etesian Winds* are northerly winds which prevail in summer on the Mediterranean. They are caused by the great heat of North Africa at this season, and consist in a general flow of the air of the cooler Mediterranean to the south, to take the place of the heated air which rises from the sandy deserts. The *Mistral* (q.v.) is a steady, violent north-west wind, felt particularly at Marseilles and the south-east of France, blowing down on the Gulf of Lyons. The *Pampero* blows in the summer season from the Andes across the pampas of Buenos Ayres to the seacoast. It is thus a north-west wind, and so far analogous to the stormy winds which sweep over Europe from the south-west. But since it comes from the Andes over the South American continent, it is a dry wind, frequently darkening the sky with clouds of dust, and withering all vegetation.

Lord Bacon remarked that the wind most frequently veers with the sun's motion, or passes round the compass in the direction of north, north-east, east, south-east, south, south-west, west, and north-west, to north. This is due to the fact that by far the greater proportion of the storms of north-western Europe follow their course to eastward along paths lying to the north of the British Islands. Dove of Berlin first propounded the *Law of the Rotation of the Winds*, and showed that the whole system of atmospheric currents—constant, periodical, and variable winds—obey the influence of the earth's rotation as they blow from regions of high pressure, where there is a surplus, towards regions of low pressure, where there is a deficiency of air.

Boreas was the north wind of the ancient Greeks, called by the Romans *Aquilo* or *Septentrio*; *Notus* or *Auster*, the south wind; *Eurus*, the east or south-east; *Zephyrus* or *Favonius*, the west wind. *Africus* (Gr. *Lips*) was south-west.

See Meteorology and Storms, with works cited; Euroclydon, Harmattan, Roaring Forties, Simoom, &c.

Windau, or Vindau, a Russian seaport, in the province of Courland, 120 miles NE. of Memel. Pop. 6094.

Windermere, or Winandermere, the largest lake in England, called from its beauty 'Queen of the Lakes,' is partly in the county of Lancaster, and partly divides that county from Westmorland. It is nearly 11 miles long and about 1 mile in extreme breadth; is fed by the Brathay and the Rothay, the waters of which become united before entering the lake, and by the streams which drain the neighbouring lakelets of Esthwaite, Troutbeck, and Blelham; and, lying 134 feet above sea-level, discharges its surplus waters southward into Morecambe Bay by the Leven. Next to Wast Water, Windermere is the deepest of all the English lakes, its greatest depth being 219 feet, while Wast Water is 258 feet deep. It contains a number of islands, the largest being 28 acres in area. Soft rich beauty is the principal characteristic of the islands of the lake, of the wooded shores, and of the scenery around; there being a total absence of that wildness and sublimity which characterise some of the other lakes, except at the north end, where Langdale Pikes, Harrison Stickle, Sca Fell, and Bow Fell stand forward prominently in the landscape. The east and west shores are bounded by gentle eminences exuberantly wooded, and numerous villas and cottages peeping out of the woods give an aspect of quiet domesticity to the landscape. About a mile from Waterhead, at the north extremity of the lake, is the town of Ambleside, 1½ mile north-west of which is Rydal, the residence of the poet Wordsworth; in the vicinity of Waterhead is Dove's Nest, the cottage at one time occupied by Mrs Hemans; farther down the east shore is Elleray, famous as the residence of 'Christopher North;' and half-way down the lake, on the eastern shore, is Bowness. The village of Windermere (pop. 1500), nearly a mile from the east shore of the lake, and 300 feet above its level, has a railway station. See Lake District, with map, and works there cited.

Windflower. See Anemone.

Windgalls are puffy swellings about the fetlock-joints of animals, particularly of horses, resulting from an increased secretion of synovia arising from work, particularly on hard roads: they are generally unassociated with any pain, heat, or lameness, and are not generally considered to be causes of unsoundness. If the horse be young they may disappear if the animal be allowed a long rest and the parts blistered once or twice. Old horses having windgalls are generally kept at work, the legs being bandaged when in the stable.

Windham, William, statesman, was born of an ancient Norfolk family at London, May 3, 1750. He was educated at Eton, at Glasgow University, and University College, Oxford. After the usual course of travel he began to acquire notoriety as an

opponent of the administration of Lord North, and in 1784 was returned to parliament for Norwich. In 1783, on the formation of the Portland ministry, remarkable for the coalition of Lord North and Mr Fox, he had become principal secretary to Lord Northington, then Lord-lieutenant of Ireland, but ill-health soon obliged him to resign. He followed Burke in his view of the French Revolution, and in 1794 he became secretary-at-war under Pitt. He went out with Pitt in 1801, and denounced Addington's peace of Amiens (1801) in a speech of splendid eloquence. This lost him his seat for Norwich, but he was elected for St Mawes in Cornwall, and on the return of the Grenville party to power (January 1806) he became war and colonial secretary. He helped Cobbett (q.v.) to start his *Political Register* (January 1802), carried a scheme for limited service in the army (1806), and at the general election in October 1806 found a seat in New Romney, and next year at Higham Ferrers. He went out of office in 1807, when the Portland administration was formed, having previously declined the offer of a peerage, and strongly denounced the expedition against Copenhagen, and afterwards the disastrous Walcheren Expedition. In 1808 a clause was introduced by his successor Lord Castlereagh into the Mutiny Act, permitting men to enlist for life, contrary to Windham's scheme of limited service, which was, however, readopted in 1847. Windham died June 4, 1810.

Windham was a brilliant talker, an excellent speaker, and in the field of letters Dr Johnson, who loved him much, called him *inter stellas luna minores*. He was a member of the famous Literary Club, and he was one of the group around Johnson at his death. All his qualities and talents were neutralised by an intellectual timidity, a morbid self-consciousness, and a fondness for paradox. In his lifetime he was nicknamed the 'weather-cock.' In 1802 he opposed the abolition of bear-baiting 'as the first result of a conspiracy between the Jacobins and Methodists to render the people serious;' and we are told that he had a passion for pugilism, and was a regular attendant upon prize-fights.

His speeches were collected in 3 vols. in 1806, with a Life by his secretary, Thomas Amyot; his *Diary from 1784 to 1810* was edited by Mrs Henry Baring (1866).

Wind-instruments. See MUSIC, Vol. VII. p. 360, and BAND.

Windischgrätz, PRINCE (1787–1862), Austrian field-marshal, played a conspicuous part in suppressing the revolution of 1848–49 at Prague and Vienna, and as generalissimo in Hungary defeated the Hungarians in several battles, but was superseded after his defeat by them at Gödöllo.

Windlass, a modification of the wheel and axle, used for raising weights, lifting water from a well, or on shipboard for hoisting the anchor. A usual form is a horizontal beam supported by spindles moving in collars or bushes, and forced round by handspikes inserted in holes in the beam. Pawls acting on a toothed-wheel prevent the beam from slipping. Windlasses are often worked by steam-power.

Windmill is a mill for performing any class of work in which fixed machinery can be employed, and in which the motive-power is the force of the wind acting on a set of sails in a manner similar to that of a current of water impinging obliquely on the float-boards of a water-wheel. The origin of windmills is altogether lost in the oblivion of the past, though their introduction into Europe is generally ascribed to the Saracens through the Crusaders. Early writers record the employment of windmills in Europe in the 12th century, mention being found of disputes in reference to tithes in connection with them. Windmills are specially adapted for use in those new countries where fuel is scarce and work may be intermittent. Economy in working forms a special feature of the utilisation of wind-power. In good situations, and under ordinary conditions, a windmill will average about eight hours' operation out of the twenty-four. At the commencement of the 19th century the whole of the grinding, stamping, sawing, and draining of the eastern counties of Great Britain was performed by wind-power; since then the steam-engine has replaced the windmill to a considerable extent, though the latter is still found extensively in the low countries on both sides of the North Sea; whilst both in France and the United States the economical if intermittent power of wind is largely utilised. The latest development of wind-power, and one for which it would appear eminently adapted, is for charging electrical accumulators, and its employment in this capacity, as advocated by Lord Kelvin of Largs, seems destined to largely increase. Windmills may be employed for supplying economical auxiliary power to steam-engines, the latter working only in periods of calm. In illustration of this an arrangement at Faversham may be quoted where a 15 horse-power windmill auxiliary to the steam-engine raised 21,000,000 gallons of water in ten months from a depth of 109 feet, thereby saving a consumption of 100 tons of coal.

The energy of the wind in actuating a windmill is exerted upon four or more vanes known as 'sails' (fig. 1, *b*, *b*), radiating from the 'wind-shaft,' *d*. The obliquity of a windmill sail, or the angle

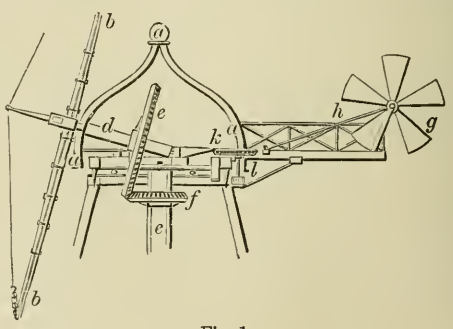

Fig. 1.

which it makes with its plane of revolution, is called its 'weather.' In the oldest or 'post' mills the entire structure was carried on a post, a long lever being provided to turn it and enable the sails to face the wind. In the 'tower,' 'smock,' or 'frock' mill (fig. 1) there is a fixed tower with a rotating cap, *a*, *a*, *a*. This cap carries the wind-shaft, *d*, and is turned by hand in the older, and automatically in the later mills, so that the sails at all times face the wind. The motion which the sails communicate to the axis is transferred by the bevelled wheels, *e* and *f*, to the upright shaft, *c*, which actuates the machinery below. The axis *d* of the sails is inclined at an angle of from 5° to 15° to the horizon to enable the sails to revolve clear of the base of the tower. The transference of the plane of rotation of the sails to right angles with the wind was formerly effected by manual labour applied by a winch at the bottom of the tower, actuating an endless band and rotating the dome above through a rack.

About the year 1750 Andrew Meikle devised a successful automatic appliance for moving the sails so as to catch every wind. He placed a supplementary set of revolving vanes of about 10 feet diameter at the back of the rotating cap and at

right angles to the cardinal sails; by reducing the motion of the new set of vanes about 5000 times by means of worms, he caused the cap to veer round to the wind. This apparatus consists of a revolving 'flyer' or fan (fig. 1, *g*) projecting from a gallery fastened to the dome on the side opposite to the sails; *h*, a long shaft of small diameter with a spur wheel at the end furthest from the mill, geared into a corresponding wheel on the axis of the flyer (these wheels are not seen in fig. 1, being behind the flyer); and a pinion at the other end of the shaft acting upon cog-wheel *k*, which carries on the lower extremity of its axis a pinion, *l*, which can at pleasure be geared into the rack on the lower edge of the dome. The construction of the sails, generally four in number, is shown in fig. 2.

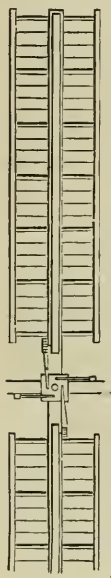

Fig. 2.

Each sail consists of a 'whip' or radius, usually from 30 to 40 feet long, firmly fastened at right angles to the sail-axle, and pierced at from one-sixth or one-seventh of its length from the axle to its extremity with about twenty holes, into each of which a crossbar from 5 to 6 feet long is inserted, and this framework strengthened by light rods connecting the ends of the crossbars is then covered with canvas in the older mills. The crossbars, however, are not set in the plane of revolution of the whips; for in such case the wind, acting in a direction coinciding with that of the sail-axle, would impinge perpendicularly on the sails, and no rotatory motion would result; the bars, therefore, are set at an angle varying, as the velocity increases, from sail-axle to outer extremity. A variation of the angle from 18° at the first crossbar to 7° at the extremity is a very effective form. The amount of sail that a windmill can carry with advantage is limited, according to Smeaton, to seven-eighths of the area of the circle described by one whip. Formerly a windmill sail was covered with a sheet of canvas, of which a greater or less extent could be spread according to the strength of the wind. Since then various methods have been devised for reefing the sails—i.e. for varying the surface exposed to the wind while the mill is in motion; in some arrangements rollers are employed on which the canvas can be rolled up, in others boards are furled by sliding behind each other, as in a fan, or turn on axes into different positions, as in a Venetian blind. Sir William Cubitt's automatic reefing arrangement, introduced at the commencement of the 19th century, was of the last-named type, the sails being of thin boards held up to the wind by a weight. As the force of the wind increased the 'valves' were pressed back and exposed less surface. According to Smeaton, the best speed for the tips of the sails, weathered as above stated, is about 2·6 times the velocity of the wind, whilst the same authority gives the effective power of a windmill with sails of best form, and about 15½ feet radius, with a breeze of 13 feet per second, at about one horse-power.

The horse-power of windmills may be derived from the following formula due to experiments by Coulomb: n = the number of sails; A = area of each sail in square feet; V = velocity of wind in feet per second; then horse-power $= \frac{n A V^2}{1,660,000}$, assuming the speed of the tips of the sails to be about two and a half to three times the wind velocity.

The largest windmills in Great Britain are to be found in Norfolk, where the wings describe a circuit of 100 feet diameter, and with a moderate breeze drive six pairs of millstones 4 feet 6 inches in diameter, grinding collectively 30 bushels of flour per hour. In American windmills the sails are not unfrequently arranged in an annulus or disc, and consist of narrow boards or slats arranged radially, each board being inclined at a constant angle of weather. An ingenious form of horizontal windmill was patented by Mr Giraudat of New York in 1861. The peculiarity is in the sails, which are hinged in such a way that the force of the wind acting on one face of them preserves their perpendicularity to it, and secures thereby a maximum effect; but when after a further semi-revolution the other side is presented to the wind the sails are raised to a horizontal position.

Window (Icel. *vind-auga*, lit. 'wind eye') is an opening in the wall of a building for the admission of light and air. In the East, from time immemorial, windows open not upon the street, but upon an interior court, and are usually provided with lattices or jalousies, or stone and alabaster tracery to exclude the sun's rays. The Chinese use instead of window-glass a thin stuff varnished with shining lac, polished oyster-shells, and thin plates of horn. Among the Romans windows were originally closed with shutters; afterwards they were made of a transparent stone, *lapis specularis*—which from the description can be nothing else than mica—and, in the 2d century after Christ, of horn. According to some there are traces of glass windows having been used in Pompeii; but the matter is doubtful. The first indisputable mention of glass windows is made by Gregory of Tours in the 4th century of our era, who speaks of church windows of coloured glass. St Wilfrid, after succeeding to the bishopric of York in 665, filled the vacant windows of the minster with glass. In 674 Abbot Benedict Biscop brought artists from France to glaze the windows of the abbey of Wearmouth; and the Bishop of Worcester did the same in 726. Leo III., in the end of the 8th century, put glass windows into the church of the Lateran. Glass began to be used in windows of private houses in England as early as 1180, in France in the 14th century. As late as 1458 it struck Æneas Sylvius very much that in Vienna most of the windows were glazed. See GLASS.

In ancient temple architecture windows were unknown—the light being obtained either from the door or from openings in the roof. In Gothic architecture, however, the window is one of the most important features, giving, by the infinite variety of its outline, and the graceful forms of its tracery, as much character and beauty to the Gothic edifices as the columns and colonnades of ancient art gave to the classic temples.

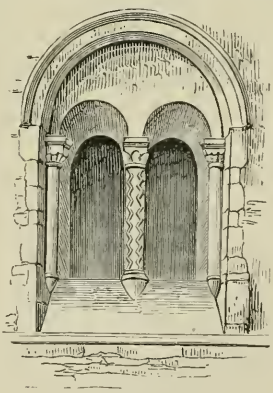

Fig. 1.—Bucknell, Oxford.

In the early Gothic or Norman style the windows were small and comparatively stunted—they were either simple narrow openings with semicircular head, or two such grouped together with a larger arch over both, and decorated with the usual mouldings and ornaments of the style (fig. 1). The inside had generally a wide splay, and simple moulding on the angle. Small circular windows sometimes occur in Norman work.

In the Early English style the windows were elongated, and had pointed arches. They were frequently grouped in twos or threes, and placed so close together that the wall between became a mullion. The wall space over the group contained within an enclosing arch was then perforated with a quatrefoil or other ornamental opening, and thus the simpler forms of tracery were introduced. The interior arches were splayed off, and were frequently very elaborately decorated with shafts and arch mouldings. The lancet window (so called from its shape) is common in this style. Circular windows are also used with tracery formed by little radiating shafts united by small arches. The triangular window, on a small scale, is also occasionally to be met with.

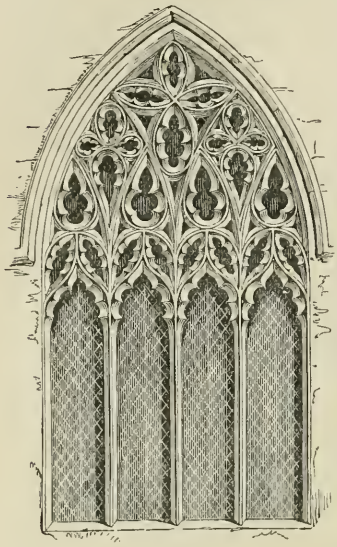

Fig. 2.
Little St Mary, Cambridge, *circa* 1350.

In the Decorated Style (q.v.) the windows become enlarged and filled with mullions and tracery. This was at first simple, and composed of geometric figures such as the origin and progress of tracery naturally led to. As the style advanced, more flowing forms were introduced, until, in the 15th century, the tracery passed into the Perpendicular (q.v.) style in England, and into the Flamboyant (q.v.) in France. The heads of the lights and the apertures in the tracery are usually foiled (fig. 2), and the inner jambs are splayed and ornamented with mouldings, shafts, &c. In elaborately traceried windows the jamb and arch mouldings are occasionally small, but they are usually bold and deep.

In the later Tudor style the window-heads became flattened into the four-centred arch; and in the time of Elizabeth and James I. the arch gave place altogether to the horizontal lintel with the opening divided by mullions into rectangular lights, sometimes foiled at top. Circular or Rose windows, with elaborate tracery, are chiefly found in the Decorated period.

In domestic buildings the windows are similar to the above, but square-headed windows occur more frequently to suit the level line of the floors; and the space between the sill and the floor is recessed and fitted with seats. Transoms are also of common occurrence. The upper part of the window is generally filled with glass fitted into a groove in the stonework, while the lower part is provided with hinged wooden shutters. The Bow or Bay Window (q.v.) is also a frequent and very elegant feature in the later Gothic buildings.

In the revived Classic styles the windows are almost invariably plain rectangular openings, with either a flat lintel or semicircular arch-head. They have sometimes architraves round the jambs and lintel, or are ornamented with pillars supporting an entablature or pediment above. The architraves are frequently carved, and the cornices carried on trusses at each side.

See also the articles Gothic Architecture, Dormer, Glass (Painted), illustrations of many cathedrals (as those of Amiens, Burgos, Notre Dame at Paris, &c.).

Windpipe. See Larynx, Trachea, Throat, Respiration, Strangulation.

Winds. See Slovenians.

Windsor, a town of Berkshire, on the right bank of the Thames, opposite Eton, 21¼ miles W. by S. of London by rail, 43 by river. The exact meaning of the name is unknown. Its ancient form is *Windleshores*. The kings before the Conquest appear to have had a hunting-lodge here, and Edward the Confessor granted the manor to the abbey of Westminster. Harold, before he assumed the crown, had a castle in the adjoining parish of Clewer, on the summit of a chalk bluff, and after the Conquest the king exchanged Old Windsor with the abbot, but resided occasionally at the castle in Clewer, to which the name of New Windsor was given. This name was also acquired by the town which grew up round the walls of the castle. In the course of centuries the timber defences, which are probably all that Harold left on his mound in Clewer, grew into the stately palace we see now. Henry I. resided much here, and married his second queen in the chapel. Henry II. made additions, especially in the Upper Ward, where some remains of Norman architecture have been identified. John was at Windsor after the granting of Magna Charta. Edward III. was born in the castle, where, in later years, he established what is now the oldest order of chivalry. To receive the knights of St George, or the Garter, the Round Tower was built on Harold's mound. The Black Prince married at Windsor the lady who was called 'the fair maid of Kent,' though she had been twice married and had four children. Froissart mentions the castle where he saw King Edward in mourning for Queen Philippa. David Bruce and James Stuart, kings of Scotland, were prisoners at Windsor. Henry VI. was born here in 1421. Edward IV. built St George's Chapel, in which, with his predecessor, he lies buried. Henry VII. completed the chapel and built the so-called Tombhouse, part of which is, however, of the time of Henry III., who built it in honour of St Edward the Confessor. Henry VIII. gave the chapel of St Edward to Wolsey, who had a magnificent tomb of black marble made for himself. This was stripped of its ornaments at the Commonwealth, and was finally sent to St Paul's for the funeral of Nelson. Henry VIII. was buried in St George's Chapel, beside Jane Seymour. Queen Elizabeth loved Windsor, and built some chambers which still remain on the north side of the Upper Ward, and are now comprised in the royal library. James I. also was much at Windsor. Charles I. is buried in the grave of Henry VIII. Charles II. employed Wren to build the state apartments. James II. turned Wolsey's Tombhouse into a Roman Catholic chapel, and received the papal nuncio here in July 1687. William III. came to Windsor in the winter of the following year, on his famous journey from Torbay to London. Queen Anne used to hunt in the park in a chaise, but lived in a small house on the south side of the castle. It was not much affected by George I. or George II., but George III. made it his principal residence, adding considerably to the Queen's House, and also using the state apartments. Madame D'Arblay has amusingly described court life at Windsor. George III. passed his declining years of dotage and blindness in the lower chambers of Queen Elizabeth's

building. Queen Charlotte left the Queen's House for Frogmore; she died in 1818, and in 1823 the Queen's House was pulled down. The royal stables were built on the site in 1839. Meanwhile Wyatville had transformed the castle, under George IV., who came from his lodge in the Great Park to take up his residence in 1828. He died at the castle in 1830, his successor, William IV. in 1838, and the Prince Consort in 1861, all three, by a coincidence, in the same room. Many royal marriages have taken place in St George's Chapel. Prince Leopold, Duke of Albany, is buried in the Wolsey Chapel, and the tomb of the Duke of Clarence is in the same place, which has been magnificently decorated, and contains a cenotaph to the Prince Consort.

As we see it now Windsor Castle consists of an Upper and a Lower Ward, between which is the Mound and the Round Tower. In the Upper or eastern Ward are the Library, the state apartments, the Long Corridor, and the private apartments. Wyatville ingeniously connected all the isolated towers and the curtain wall between by means of this corridor, which is 520 feet in length. The state apartments contain many good pictures and other works of art. In the Lower Ward is St George's Chapel, with its cloisters, the Deanery, and the Canons' Houses. The last named contain remains of the palace of Henry III. Adjoining to the westward are the Horseshoe Cloisters, which contain the houses of members of the choir. Next to them are the barracks, including the Curfew

Windsor Castle.

Tower, built by Salvin. On the south side is the principal gate, called after Henry VIII. In a line with it are the houses of the Military Knights, a band of pensioners. The Round Tower is the residence of the constable, and from it floats the royal standard. Wyatville lived, till his death in 1840, in the Winchester Tower, called after William of Wykeham. Wyatville made Windsor what it is, and, though we may find fault with his details, his proportions and his eye for a grand scenic effect place him far ahead of any other architect of the so-called Gothic revival.

The town of New Windsor was chartered by Edward I. It contains some interesting old houses, but nothing that can with certainty be dated back to the time of Shakespeare, whose *Merry Wives of Windsor* is said to have been written for Queen Elizabeth. Sir C. Wren, who was M.P. for the borough in the Convention Parliament which elected William and Mary, built the town-hall in the market-place. The town is pleasantly situated close to the Home Park, and the famous Long Walk, an avenue of elms 3 miles long, which leads to the Great Park. East of the Long Walk are the tombs of the Duchess of Kent and of the Prince Consort, in domed chapels; also Frogmore, the royal gardens, the farm and the dairy. The Great Park contains a church, Cumberland Lodge, and Virginia Water (q.v.), which is nearly 5 miles from the castle. The number of Windsor's parliamentary members was reduced from two to one in 1867. Tapestry works established here in 1872 succumbed in 1888. Pop. (1851) 9596; (1891) 12,327.

See Tighe and Davis, *Annals of Windsor* (1848); G. M. Hughes, *History of Windsor Forest* (1890); and *Windsor Castle*, by the present writer (3d ed. 1891).

Windthorst, Ludwig (1812–91), Catholic politician, was born near Osnabruck, and became distinguished as advocate and politician in Hanover. After the absorption of Hanover by Prussia, he became leader of the Ultramontanes in the German parliament, and chief opponent of Bismarck during the Kulturkampf (see Germany, p. 185).

Windward Islands, a group in the West Indies (q.v.) comprising St Lucia (the largest), St Vincent, Barbadoes, Grenada, and Tobago.

Wine, the fermented juice of the grape, is a highly complex liquid, whose proximate constituents are exceedingly liable to change. The juice, technically termed 'must,' as obtained by pressure from the grapes, is a somewhat viscid fluid, having a strong tendency to spontaneous fermentation when exposed to the heat of the sun. The must consists chiefly of water holding in solution, or suspended in exceedingly minute division, grape-sugar (*dextro-glucose* and *levo-glucose*), pectin, gum, dextrine, fat, wax, albumen, gluten; an indefinite series of compounds termed *extractives;* tartaric acid, both free and combined with potassium, as potassium bitartrate (cream of tartar) and other earthy bases. Racemic and malic acids

are also in general present, likewise traces of one or more of the following—magnesia, the oxides of iron and manganese, potassium sulphate, calcium phosphate, common salt, and silica. The juice having fermented and become wine consists (prior to doctoring, plastering, &c.), as before, chiefly of *water*, in which, however, are now held in solution or suspension various alcohols (chiefly *ethylic*), several compound ethers, and tartaric, racemic, malic, succinic, glycolic, oxalic, acetic, and tannic acids (*tannin*). It also contains (before sophistication) glycerine, trace of acetaldehyde and of butyric, propionic, and œnanthic acids. Cane-sugar is said to be absent in all natural wines; it is, however, added in the manufacture of Champagne and in certain other cases of wine-making. The colouring matter and the tannin of the red wines are undoubtedly largely imported into them from the skins and the grape-stones during fermentation. The tannin and the various acids are supposed to exert a preservative influence on the wine. In normally coloured wine the oxidation of the œnotannin of the seeds, stalks, and husks, and of the *extractives* of the juice, contributes largely to the result.

The *Bouquet*, or peculiar aromatic odour of wines, is dependent on one or other of the compound ethers—aceto-propylic, butylic, amylic, caprylic, buto-ethylic, caprylo-ethylic, capro-ethylic, pelargo-ethylic, tannic, or other ether. The *bouquet* of wines, according to Rommer's experiments, is said to pass with the yeast from one wine to another, that is if the ferment from the must of one district be made to set up the fermentation of must derived, say from the Champagne, Côte d'Or, or other celebrated districts; in each case the wine had the bouquet of the vintage from which the special ferment was taken. The general *vinous odour*, common to all wines, is supposed to be due to the presence of *œnanthic ether*. The character of the wine, however, largely depends on both soil and climate. Thus a certain variety of grape grown on the Rhine gives a species of Hock; the same grape raised in the valley of the Tagus yields Bucellas; while in the island of Madeira it gives a wine known as Sercial, of entirely different flavour from either. The quantity of sugar in grape-juice varies extremely. In the juice of very ripe grapes it may reach 40 per cent. According to Fontenelle, the juice produced in the south of France contains from 18 to 30 per cent.; while in the neighbourhood of Stuttgart Reuss determines it at from 13 to 25 per cent. In the low and variable temperature of Holland, the juice of the best grapes yields only 10 or 12 per cent. of sugar. The composition of the albuminous matter is not clearly determined. It probably varies at from 1 to ½ per cent., and equals in weight only about $\frac{1}{30}$th of the sugar present.

The saccharin contents of grape-juice range from 13 to 30 per cent. If we regard all this sugar as grape-sugar, $C_6H_{12}O_6$, with a molecular weight of 180 (and it is from this sugar the alcohol, the essential constituent of wine, is derived), then each molecule of *grape-sugar* may be resolved, in the act of fermentation, into two molecules of *alcohol*, C_2H_6O, whose molecular weight is 92, and 2 molecules of *carbon dioxide*, CO_2, whose molecular weight is 44, according to the equation—

$$\overbrace{C_6H_{12}O_6}^{\text{Grape-sugar (180).}} = \overbrace{2(C_2H_6O)}^{\text{Alcohol (2 × 46).}} + \overbrace{2CO_2}^{\text{Carbon Dioxide (2 × 44).}}$$

provided that there is no loss; that is, under the most favourable conditions of fermentation, 180 parts (by weight) of grape-sugar (with the symbol $C_6H_{12}O_6$) may yield 92 parts of alcohol; or, roughly speaking, 2 parts by weight of sugar yield 1 of alcohol. From this, says Mulder, 'the juice of French and German grapes gives, when analysed, as a maximum, from 7 to 15 per cent. of alcohol by weight.'

According to Mulder, sugar is found in all wine, and its quantity depends to a considerable extent upon the treatment to which the grapes are subjected before pressure. Dr Bence Jones, in the appendix to his translation of Mulder's work, however declares, on the other hand, that, while Port, Sherry (except in two instances), Madeira, and Champagne always contained sugar, Claret, Burgundy, Rhine, and Moselle wine (excepting one sample of Sauterne) were always free from every kind of sugar. Tokay wine, for example, is prepared from grapes which have been allowed not only to get over-ripe, but partly to dry on the vines; *vin de paille* is obtained from grapes dried on straw exposed to the sun; and in both these cases water is evaporated, and the concentrated juice yields a wine of extra strength. The strong heavy wines used by the ancients were thus prepared.

In consequence of the close connection which exists between the amount of sugar in the grape-juice and the strength and excellence of the wine which it yields, extraneous sugar is introduced into the juice, so as to *doctor* it. For this purpose a cheap fermentable sugar is added to the sour juice, an adulteration which cannot subsequently be detected by chemistry. Many imitations of port wine are thus manufactured. If fermentation goes on till all the sugar is converted into alcohol a *dry* wine is produced; when it is checked before the change is completed a rich *fruity* wine is produced. Wines are thus divided into *dry* and *sweet* or *fruity* wines. When wine is bottled whilst the fermentation is still in progress *effervescent* wine is formed.

Shortly after the must has passed from the wine-press symptoms of fermentation appear; the juice becomes more turbid, bubbles rise to the surface, and a froth soon settles there. This process in a moderate climate usually reaches its highest point in three or four days; before it is quite finished the whole liquid mass is stirred up, so as to re-excite the process. For this purpose, in many districts, a naked man used to go into the wine-tub, who both accomplished the necessary stirring, and promoted fermentation by his animal heat. In two or three weeks the fluid becomes comparatively clear, and a precipitate accumulates at the bottom of the vessel. The wine is now removed from the sediment into another vessel, and a slow form of fermentation—*after-fermentation*, as it is termed—goes on for several months, *sugar* being constantly converted into *alcohol* and *carbon dioxide*, a fresh precipitate collecting at the bottom of the vessel as before. Several similar changes into other vessels are made, to get rid of the sediment, till it is fit for transferring into casks. That the process of fermentation may go on satisfactorily not only must water, sugar, and a nitrogenous matter in a state of actual change be present, but there must be a certain temperature and a certain amount of atmospheric air present. 'Although,' says Mulder, 'there is a wide interval between the extremes of temperature at which fermentation is possible, the boundary is very narrow which limits good and active fermentation in every kind of wine. The grapes of each country ripened under different degrees of summer warmth, and very unequally rich in constituents, require very different temperatures during fermentation; and different temperatures are also required for grapes which are the product of a warmer or a colder summer. But on these points we have little accurate knowledge.

All we know is that a high temperature during autumn promotes fermentation, and a low one is detrimental to it; and that *inequality* of temperature during fermentation is extremely injurious, and not unfrequently spoils the wine altogether.' To what extent it is expedient to admit atmospheric air to the must, so that the fermentation may go on most favourably, is a point which is not even yet definitely settled.

The actual organism—*ferment*—which causes the breaking-up of the grape-sugar of the grape-juice into alcohol and carbon dioxide is, according to Pasteur, the *Mycoderma vini*. It is always, normally, found in the *bloom* on the surface of the grape, and much resembles in structure and action the *Torula* of fermenting wort. It is from this circumstance that grape-juice at proper temperatures will ferment. Of itself, according to Engel, one cell of *Mycoderma vini* will in forty-eight hours produce 35,378 cells.

The leading points in which the constituents of grape-juice and those of wine differ from one another in consequence of fermentation are that in the wine there is a diminution (1) of the mucilaginous and saccharin matters, in consequence of the formation of ferment and alcohol; (2) of those substances which are insoluble in common water, but are held in solution in the viscid must, as, for example, calcium and magnesium tartrate; and (3) of cream of tartar and potassium sulphate, which, being less soluble in spirit than in water, fall as the formation of alcohol increases. Red wines lose a portion of colouring matter and of the tannin, which is withdrawn by these salts, and hence become of a lighter colour and less astringent.

The process of *fining* or *clearing* is undertaken with the view of removing all the sediment in which albuminous matters may still occur, and of diminishing the colouring matter and tannin of red wines. Amongst the substances used for these purposes may be mentioned albumen (white of egg), isinglass, gum, milk, lime, gypsum, &c. In warm countries gum is preferable to albumen or isinglass. The addition of lime throws down a precipitate of salts of lime, which carries down, in the case of red wine, a considerable quantity of colouring matter; its addition gives a sweeter and less astringent taste to the wine, and an appearance of age. As a general rule clearing increases the durability of wine. *Sulphurising* is a process which is especially applied to sweet white wines, which possess an excess of sugar and albuminous matter, and little tannic acid, and thus become easily decomposed. Its object is to check undue fermentation, and to prevent the formation of mould, which afterwards imparts a musty taste to the wine. The process is effected by burning sulphur (which should be free from arsenic) in bottles or casks, and instantly pouring in the wine, which absorbs the sulphur dioxide (converted by absorption into sulphurous acid). Wine intended for exportation to warm climates is usually strongly sulphurised.

The ages at which different wines attain their perfection are, as is well known, extremely different. 'As a general rule,' says Mulder, 'wines which have retained a considerable portion of albuminous matter, and possess but little tannic acid, cannot resist the influence of time; they become acid, or undergo some other change. This occurs in the case of Rhine wines, which contain but little alcohol; and all those wines which contain much sugar, or but little tannic acid, cannot be kept long. Wines which can be *cellared* are those which improve; or, to speak more correctly, those wines are stored which improve with age. In these odoriferous substances are formed, and the wine becomes less acid and better tasted. Such wine as is coloured often deposits a considerable amount of sediment; and if it be stored in casks there is a constant increase of alcohol.' Wine is improved by being kept in wooden casks, as water escapes by evaporation, and the other constituents are relatively increased. The vinous constituents being thus concentrated exert a stronger chemical action upon each other, and render the wine not only stronger, but better flavoured. The change, however, does not stop here. The loss of water must be replaced by the addition of wine, otherwise the action of the air would turn the wine sour, and convert the alcohol into acetic acid; and the diminution of water, which is thus replaced by wine, causes a constant increase of tartaric acid. Wines which are poor in sugar may thus soon become too sour; and consequently all wines cannot undergo this process. The popular idea that wine which has grown old in bottles has therefore become richer in alcohol is altogether false, and is doubtless founded on the fact that it is only the strongest wines that can be preserved. The colour, however, of bottled wine is materially affected by age, liqueur-wines and red wines containing no large amount of tannic acid becoming darker, while wines which are rich in tannic acid, as port wine, for example, deposit a sediment, and become lighter. *Old* bottled wines contain odoriferous constituents—ethers of various organic acids—which are not found in *new* wine. This effect of time may, however, be imitated by art—by *Pasteuring* the wine. Pasteur first showed that for the due preservation of wine it was necessary to kill the *microbes* whose presence was deleterious to it; he also showed that a temperature of 60° C. (140° F.) in the presence of the alcohol in the wine, the wine being shut out of contact with the air, was sufficient to accomplish this object. But it was afterwards found that not only was the wine thus treated preserved from spontaneous deterioration, but that it had acquired much of the flavour, aroma, and other qualities characteristic of good old (*matured*) wine. This process should naturally much lessen the cost of 'old' wine. If bottles corked, but not quite filled with wine, are placed for two hours in warm water at a temperature of 185° F., and after cooling are filled, their contents will be found to have acquired the flavour and aroma of wine that has been bottled several years. Wines which have been long in bottle sometimes acquire a peculiar flavour, which is incorrectly referred to the cork. It is in reality due to the peculiar mould which grows from the outside of the cork inwards; and should it reach the inner surface it imparts to the contents of the bottle a peculiar taste; and this wine is said to be *corked*. Very similar to this is what is known as 'the taste of the cask,' a peculiar flavour sometimes acquired by wine before bottling. This flavour is regarded as dependent on the development of a peculiar essential oil, during the growth of 'mould,' on the surface of the wine. It can be removed by the addition to each pipe of about a quart of olive-oil, which dissolves the unpleasant flavouring matter, and carries it to the surface.

Colouring, Doctoring, and Plastering of Wine.—Our limits prevent our even giving a list of the adulterants used in colouring wines, including such innocuous substances as mulberries, bilberries, &c., and terminating in such poisonous substances as magenta and other aniline or coal-tar colours. All good natural wines tend to become turbid, both as they age and with change of temperature. To prevent this *gypsum* (plaster of Paris, or calcium sulphate) is used. The chief cause of the turbidity of bottled wine is potassium bitartrate; the plaster of Paris removes this, leaving in its place acid

potassium sulphate with a little free sulphuric acid. These give a peculiar dryness to wines, much admired by connoisseurs, who neither know its source nor are aware of the tendency to gouty diseases it may encourage or induce.

Bence Jones gives the following table showing the percentage of alcohol in the best-known wines :

	Per cent.		Per cent.
Port	20·7 to 23·2	Burgundy	10·1 to 13·2
Madeira	19·0 " 19·7	Rhine Wine	9·5 " 13·0
Sherry	15·4 " 24·7	Claret	9·1 " 11·1
Champagne	14·1 " 14·3	Moselle	8·7 " 9·4

Many of the lighter clarets, however, have not more than 7 per cent. of alcohol; brandy and whisky have usually about 50 per cent.; rum, somewhat more; gin, about 40; Burton ale, 5·5; porter, about 6; the strongest Edinburgh ale, 12; lager beer, 3; and cider, from 5 to 8 per cent.

In red Bordeaux very little sugar is found; red Sauterne contains less than 1 per cent. of extract, and Hermitage 1·7; hence the quantity of sugar must be very minute; while some kinds of Muscat yield 24·5 of an extract, containing about 22 per cent. of sugar. Good red wines should contain at least ½ per cent. of sugar. Some of the sweet wines contain nearly one-fourth of their weight of saccharin matter. Bence Jones found that in

Sherry (18 samples),	sugar in 1 oz.	varied from	4 to 18	grains.
Madeira (9 samples),	"	"	6 " 20	"
Champagne (4 samples),	"	"	6 " 28	"
Port (8 samples),	"	"	16 " 34	"
Malmsey Madeira,	"	"	56 " 66	"
Tokay,	"	"	74	"
Cyprus,	"	"	102	"

Under the term 'free acids' are included the acid potassium tartrate, known as cream of tartar, and other soluble bitartrates found in wine, besides such acids as are quite uncombined. Sugar has so much power in concealing the free acids that their amount cannot be estimated with any certainty by the flavour of the wine, and must therefore be estimated by ordinary chemical methods. Traces of tannic acid may be found in all white wines, but in no white wine is it sufficiently abundant to be of the slightest importance in a medical or dietetic point of view. On the other hand, it is abundant in Port and heavily loaded Bordeaux wines, especially when new. In the course of time this tannic acid becomes oxidised into a sparingly soluble compound, which is called by Berzelius the *apothema*, or precipitate of tannic acid—a process which is facilitated by the exposure of the wine in bottles to full daylight. There is no doubt that this acid, by combining with the albuminous matters, tends to increase the durability of these wines. Bence Jones holds that 'proceeding from the least acid wine to the most acid, we have Sherry, Port, Champagne, Claret, Madeira, Burgundy, Rhine wine, Moselle.'

The recent decline in French vintages by reason of the Phylloxera has developed a new wine-making industry in France. Enormous quantities of dried raisins are imported, mainly from Smyrna and the East, are soaked in water for forty or fifty hours, and then treated as fresh grapes, yielding a harmless white or straw-coloured wine.

Diseases of Wine.—(1) *Turning* is incidental to young wine, and seems to occur under special conditions of the weather. The colour becomes darker, and the taste first disappears, and if the disease goes on becomes disagreeable; the wine becomes turbid and acid. This disease is caused by a decomposition of tartar. (2) *Ropiness* consists in the formation of a sort of vegetable mucus from the sugar of the wine, and is known as *viscous* or *mannitic* fermentation, due, according to Pasteur, to a special microbe. The wines liable to this change are those which are deficient in tannic acid. (3) *Bitterness*—to which Burgundy wines are especially exposed—seems due to a second fermentation, inasmuch as a large amount of carbon dioxide is evolved; it has been ascribed to the formation of citric ether. The disease is caused by the sediment, and often ceases on the wine being drawn off into other casks. (4) *Acidifying* depends upon the conversion of the alcohol into acetic acid, and may be stopped at its commencement by adding alkaline carbonates, which, however, destroy the colour and affect the taste of the wine. This acidification is due to a special microbe. (5) *Mouldiness* is a disease in which mould-plants are produced on the surface of the wine; the admission of air is favourable to the disease.

Manufacture.—The mode of manufacturing wine varies in its details in different countries. Pagnierre, in his treatise *On the Wines of Bordeaux*, gives the following description of the manufacture of the superior Clarets. The grapes, after being gathered, are picked, all that are likely to injure the quality of the wine being carefully removed. A principal vat of the best fruit, which is called the mother-cask (*cuve-mère*), is then made, into which, after picking, the workmen continue to put the best grapes, without their stalks, and without treading them, till they are from 15 to 20 inches deep; after which they throw about two gallons of old Cognac or Armagnac upon them, and then another bed of picked grapes, followed by two gallons more of brandy, and so on till the vat is full. Spirit of wine is then added, about four gallons being used for a wine-vat of from thirty to thirty-six tuns. The amount of brandy and spirits that is added varies with the quality of the vintage, the better vintages requiring the less spirit. When there is a deficiency of saccharin matter in the grapes starch-sugar is sometimes added. The *cuve-mère* when filled is closed and well covered with blankets to prevent the entrance of air, and is left in this state for about a month. A small cock or tap is placed in the side of the vat at about a third of its depth from the bottom, in order to allow of the progress of fermentation being observed, and to enable the manufacturer to know when the wine, having become cool and sufficiently clear, may be racked off and put into casks, previously prepared by scalding and rinsing with a little spirit. While the *cuve-mère* is at work the ordinary vintage goes on as follows: The grapes are trodden or acted on by machinery in the press, and put with their stalks into the vats, when the fermentation takes place naturally. About a foot of the upper part of the vat is not filled, in order to leave space for the fermentation, which in very mature vintages sometimes occasions an overflow of these limits. The term *chapeau* is applied to the floating mass of stalks, seeds, and skins on the surface. The vats are lightly covered, and in from a week to a fortnight the wine is ready for being drawn off; for if it is left upon the lees (*marre*), or in contact with its crust (*chapeau*), it would take the disagreeable taste of the stalks. The barrels in which it is then placed are filled to about two-thirds or three-fourths, after which the *cuve-mère* is emptied, and its wine is poured in equal portions into these casks so as to fill them; and the remainder is used to replace every week what is lost by evaporation, or may have leaked away. All proprietors have not the means of making a *cuve-mère;* but in its absence, and with the employment of small vessels, wine of an inferior character is produced. The casks being full are left unbunged for about a week, the bung-hole being in the meantime covered with a brick or piece of wood. They are filled up every two days, and after bunging at least once a week, till the wine is in a state to allow the cask to rest with the bung-hole at the side, which is not till after a year and a half.

White wines are made in a somewhat different manner. The grapes are not, as in making red wine, put into the vat to ferment, but after the removal of the stalks they are trodden, and when taken from the press the juice, skins, and seeds are put into casks, in which the fermentation takes place, and wine is formed. When the fermentation has ceased the wine is racked off from the barrels into smaller casks; and any loss from evaporation is replaced once or twice a week.

The wine-presses of the Jews consisted of two receptacles, or vats, placed at different elevations, in the upper one of which the grapes were trodden, while the lower one received the expressed juice or must (see Joel, iii. 13). These vats were usually hewn out of the solid rock (Isa. v. 2 [margin], and Matt. xxi. 33). The ancient Egyptian wine-press was also thus composed of two vats or receptacles; and old Egyptian pictures showing the process of treading are familiar from such books as Wilkinson's *Ancient Egyptians*. A certain amount of juice was allowed to exude from the ripe fruit by its own pressure before the treading began. This was kept separate from the rest of the juice, and formed the *gleucos*, or 'sweet wine' noticed in Acts, ii. 13. Although the ancient system of treading the grapes still prevails in many countries, it is being gradually displaced by various mechanical appliances. In some parts of France two wooden cylinders turning in opposite directions are employed to crush the fruit; and more complicated presses are also in use.

Commerce.—The manufacture of wine has been carried on in all countries where the grape could be successfully cultivated from the very earliest periods of history; and during more recent periods it has followed the footsteps of man, and become established in the American and Australian continents. For the progress of viticulture in the United States, see VINE. The vine, like most cultivated plants, is capable of producing very numerous varieties, and these, of course, give rise to different qualities of wine; but far more influence is exerted upon the quality of the wine by climate, soil, and the position of the vineyard as to the sun's influence; so that we not only have wines peculiar to particular countries, but of those, again, we have usually very numerous varieties, produced by special causes within those countries; and in addition to all these, again, we have other differences, produced by the degrees of skill in the manufacture. The earliest wines of which we have any account were made in Asia. We find abundant evidence of the high esteem in which wine was held by the Greeks, Romans, and other civilised contemporary nations; and the name of one of the choicest Roman wines has continued in use till the present time—Falernian. From what we learn from Pliny and other writers regarding the extraneous additions made by the Romans to their grape-juice, and the treatment of the interior of their casks, we should much doubt whether even Falernian would be appreciated by the modern palate. The mediæval history of wine is involved in much obscurity. Though we find abundant mention of Sack and Canary, the Greek islands seem to have furnished a large portion of the wine then consumed in Europe, and the merchant-ships of Venice in the days of her glory appear to have been largely engaged in carrying Greek and Italian wines. The Malmsey of those times was not the produce of Madeira, but of the islands of Tenedos, Lesbos, Chio, and Crete.

Burgundy is the oldest wine-producing country of central Europe, and centuries ago the wine of this province was the choicest to be found on the tables of the rich and noble. Much of the Burgundy of the present day has excellent qualities—being of good body, velvety, and of delicate bouquet. A few scarce kinds, such as the Romanée-Conti, are really splendid wines. Claret or red wine, for the English market, is chiefly the produce of the Medoc district. It begins below Bordeaux, on the left bank of the Gironde, and stretches almost to the Bay of Biscay. White wine, or Sauterne, is also produced in the same neighbourhood. The general character of the Bordeaux wines, which are of all qualities, is crispness, elegance, and fine bouquet, and they improve by keeping. Sparkling wine of great renown is produced in the Champagne, the finest qualities of which sell at exorbitant prices.

Germany produces fine white but very few red wines. They are best known in the British market as Hocks and Moselles, and are made both still and sparkling. At the Vienna Exhibition of 1873 the jurors on the wine section had before them a sample of Rhine wine made in 1706, the year in which Marlborough gained the battle of Ramillies, another coeval with the war of American independence, and another of the year of the battle of Jena. But all these and others made in the early part of the century, before the days of 'fortifying,' had lost their characteristic taste and flavour, and were but the phantoms of what they had been.

The vineyards of Austria produce a great variety of wines, which are mostly consumed in the country itself. Hungary is still more a wine-growing country, producing considerably more than it consumes, and is the home of the renowned Tokay (q.v.), which boasts a high antiquity, and commands a fabulous price. Méneser-Ausbruch, Carlowitz, Ruster, Somlauer, and others are also favourably known, but the long land-carriage is a serious check on the trade with England.

The best Spanish sherries are those technically called *dry*—that is, free from sweetness. Manzanilla is said to be the purest, but Montilla, Amontillado, and Vino de Pasto are also famous kinds of sherry. This wine is chiefly shipped at Cadiz, near which it is made. The Malaga wines, both sweet and dry, are widely known, and from Catalonia come what are known in England as the Spanish Reds, one of them being Tent, dark and sweet, and much used as sacramental wine. Port wine (q.v.) is mostly brought from Oporto.

Italy, with great natural advantages and large home production, is behind several other nations in the manufacture and exportation of fine and especially of sparkling wines; but the Barolo of Piedmont, the Chianti of Tuscany, the Orvieto of the Roman States, the Lacryma Christi of Naples, and other special growths have a high reputation. Marsala, a wine with a sherry-like flavour, comes from Sicily. The lesser wine-growing countries of Europe are Switzerland, Russia, Turkey, and Greece, which continues as in ancient times to put resin in what is required for home consumption. The wines of Shiraz in Persia are still most excellent, and sometimes find their way to England. Australia already astonishes the best French judges by the excellence of her wines, and the Cape continues to yield her luscious Constantia and other growths of fine quality.

The boiled juice of the grape, also the water-infusion of dried raisins, have been termed *unfermented wines*. Some wine merchants supply what they designate *unfermented wine*, containing only enough alcohol (mixed with it) to preserve it, as *sacramental wine;* while other importers describe this same wine as being only *slightly* fermented, up to the point of generating the amount of alcohol necessary to its preservation. *British wines*, as gooseberry, damson, elder-berry, apricot, cherry, parsnip, and other wines, consist of the fermented juices of the fruit or roots from which they derive

their respective names. Before being subjected to fermentation they are largely mixed with sugar. The general processes in the manufacture of British wines closely resemble those which have been just described.

The imports of wine into the United Kingdom vary from about 15,000,000 to nearly 20,000,000 gallons; in an average year, as 1897, the 17,559,000 gallons imported have a value of about £6,450,000. In 1891 the United States, in addition to 25,000,000 gallons made at home (more than half of it in California), imported wine to the value of $10,000,000. In 1897 the produce of California alone was over 32,000,000 gallons. But wine had not yet become a leading export from the States; while foreign wines were still imported to the value of $6,000,000. Of European countries Italy grows most wine, Spain exports most, but the export of France (about 56,000,000 gallons annually) has a higher value than that of Spain. Austria-Hungary produces about a third of the French produce (which latter amounts to over 600,000,000 gallons).

With respect to the high prices realised by old wines of famous vintages, we may state that as much as £2 per bottle has occasionally been given for Port and Tokay; and two bottles of old Burgundy have been sold in England at the very extraordinary price of £80 each.

Dietetic and Medical Value of Wines.—It may be laid down as a general rule that the use of wine, even in moderate quantity, is not only not necessary, but absolutely undesirable for young or adult persons enjoying good ordinary health. As, however, life advances, and the circulation becomes languid, wine in moderation becomes, in the opinion of some medical writers, a valuable article of food; and even in earlier life the physician meets large numbers of townspeople, especially women engaged in sedentary occupations, who cannot digest beer. In such cases the beer is replaced by the more grateful beverage, tea, which, however, when taken too freely, and without sufficient solid food, gives rise to a form of distressing dyspepsia, which too often impels the sufferer to seek refuge in spirits. In many such cases cheap wine, which may be purchased at from 1s. 6d. to 2s. a bottle, mixed with an equal bulk of water, will be found an excellent substitute for the beer or tea. The vast quantities, says Mr Williams, of brilliantly-coloured liquid flavoured with orris-root, which would not be allowed to pass the barriers of Paris, but must go somewhere, is drunk in England at a cost of four times as much as a Frenchman pays for genuine wine (see Williams, *Chemistry of Cookery*, p. 285). 'The distinctive elements of wine,' says Dr Druitt, 'are to be had in abundance in cheap Bordeaux, Burgundy, and other French wines; in Rhine wine; in the Hungarian, Austrian, and some Greek wine; and in all with a natural and not injurious quantity of spirit. In prescribing *pure wine*—i.e. light natural, virgin wine—the practitioner has a perfectly new article of both diet and medicine in his hands.' In cases of debility and indigestion such wine as that which we are now considering, diluted with cold water, may often be freely prescribed with great advantage in place of tea at breakfast, as well as at luncheon and dinner, or dinner and supper, according as the patient arranges his meals. The best of the cheap wines are those of Bordeaux; they are pure, light, and exhilarating; moderately strong, seldom containing 20 per cent. of alcohol; free from sugar and other materials likely to induce gout or headache. The Burgundy wines are fuller, stouter (on an average from 2 to 4 per cent. stronger in alcohol), and higher flavoured than the Bordeaux of equal price. Some of the Hungarian wines are excellent substitutes for Bordeaux, and, not having the acidity, austerity, and coldness of the latter, are often preferred by patients. Amongst the most important of the *dearer* kinds of wine are Port, Sherry, and Champagne. Good old Port, now very difficult to obtain, is often recommended as a tonic of great value in cases of fever and other forms of extreme debility; but many persons past forty dare not take it if they have any predisposition to gout. Sherry is in general use, and is the only wine admitted into the British Pharmacopœia, in which it is employed in the composition of aloetic, antimonial, colchicum, and other medicated wines.

See Henderson's *History of Ancient and Modern Wines;* Bence Jones's translation of Mulder's *Chemistry of Wine;* Payen's *Industrial Chemistry*, translated by Dr Paull; Druitt's *Cheap Wines;* Thudichum and Dupré, *Origin, Nature, and Varieties of Wine;* Cyrus Redding, *History and Description of Wines;* on American wines and wine-growing, works by Hasmann, Staraszthy, Hyatt, and Rixford; *The Wine Manufacturers' Handbook*, edited by Gardner; Health Exhibition manual on the *Esthetic Use of Wine* (Thudichum); Muspratt's Chemistry applied to the *Arts and Manufactures; Chemistry of Cookery*, by W. Mattieu Williams, pp. 269–293; *Analyse des Vins*, by Dr L. Magnier de la Source; *Il Vino* (Florence, 1881), by Professor A. Graf and others; the works of Shaw and Denman, in English; those of Julien, Chaptal, Fauré, and Batilliat, in French; those of Ritter, Balling, Von Babo, Bronner, &c., in German; the chief works on technological chemistry, as Wagner's, in all languages; and the articles Vine, Alcohol, Bordeaux, Burgundy Wines, Canary, Champagne, Fermentation, Hochheim, Madeira, Malmsey, Pipe, Port Wine, Sack, Sherry, &c. in this work. For arguments as to the wine of Scripture, see Temperance, and works there cited; also Dr F. R. Lees's *Science Temperance Handbook* (vol. viii.).

Winer, Georg Benedikt, a great New Testament scholar, was born at Leipzig, 13th April 1789, studied there, and in due time became *privat-docent* and professor extra-ordinary in Theology. He was called to a chair at Erlangen in 1823, but returned as ordinary professor to Leipzig in 1832, and died there, 12th March 1858. Of his numerous works first in importance stands his invaluable and still unequalled *Grammatik des Neutestamentlichen Sprachidioms* (1821; 7th ed. by Lünemann, 1867). No less admirable are his *Biblisches Realwörterbuch* (1820; 3d ed. 2 vols. 1847–48), a storehouse of sound learning and sagacity, and the invaluable *Handbuch der theologischen Literatur* (1821; 3d ed. 2 vols. 1838–40; supplement, 1842). Winer also edited, with Engelhardt, the *Neue Kritische Journal der theologischen Literatur* (1824–30), and, unaided, the *Zeitschrift für wissenschaftliche Theologie* (1826–32).

Other works are the *Komparative Darstellung des Lehrbegriffes der verschiedenen Christlichen Kirchenparteien* (1824; 4th ed. by Dr Paul Ewald, 1882; Eng. trans. 1873); *Grammatik des biblischen und Targumischen Chaldäismus* (1824; 3d ed. by Fischer, 1882; Eng. trans. Andover, 1845). Winer's great grammar of New Testament Greek was translated into English by Moses Stuart and Edward Robinson (Andover, 1825), Agnew and Ebbeke (from 4th ed. Phila. 1839), Masson (from 6th ed. Edin. 1859), J. Henry Thayer (from 7th ed. Andover, 1869), and W. F. Moulton (Edin. 1870; 2d ed. 1877; 3d ed. 1882). See W. Schmidt, 'Zum Gedächtnis Dr G. B. Winers,' in the *Beiträge zur Sächsischen Kirchengeschichte* (1885).

Winfield, capital of Cowley county, Kansas, on Whitewater Creek, 247 miles by rail SW. of Kansas City. Pop. 5184.

Wings. See Birds, Flying.

Winifred, St, according to the legend, was a noble British maiden, whose head the prince Caradog cut off because she repelled his unholy proposals. The head rolled down a hill, and where

it stopped a spring gushed forth—famous after as a place of pilgrimage, Holywell in Flintshire (see WELLS). The saint's head was replaced by St Beuno, and St Winifred survived the miracle fifteen years.—For Winfried, see BONIFACE.

Winkelried, ARNOLD VON. See SEMPACH.

Winnebago. See WISCONSIN.

Winnipeg, capital of the Canadian province of Manitoba, stands at the confluence of the Assiniboine with the Red River, by rail 1424 miles WNW. of Montreal and 512 miles NNW. of Minneapolis. Formerly known as Fort Garry, from the Hudson Bay Company's post so called (pop. in 1871, 241), it was incorporated as the city of Winnipeg in 1873. It is substantially built of stone and brick, with wide streets traversed by tramways and lit with the electric light. The principal buildings are the government offices, city hall, post-office, numerous churches, a fine hospital, and the buildings of the university of Manitoba, which includes an Episcopal, a Presbyterian, and a Roman Catholic college. The city contains great flour-mills and grain-elevators, the shops of the Canadian Pacific Railway, and a number of manufactories, and is the busy centre of a fertile country, with a large carrying trade both by river and rail. Pop. (1871) 241; (1881) 7985; (1891) 25,642.

Winnipeg, LAKE, in Manitoba, 40 miles N. of Winnipeg city, and 650 feet above sea-level, is 280 miles long, 57 miles broad, and has an area of 8500 sq. m. Its largest tributaries are the Saskatchewan (q.v.), the Winnipeg, and the Red River of the North (q.v.); its outlet is the Nelson River (q.v.).

Winona, capital of Winona county, Minnesota, on the right bank of the Mississippi (here crossed by an iron railroad bridge), 103 miles by rail SE. of St Paul. It contains a state normal school, a number of flour and saw mills, foundries, carriage, barrel, and sash and door factories, &c., and ships great quantities of wheat. Pop. (1880) 10,208; (1890) 18,208.

Winsey, or WINCEY, a cloth consisting of woollen warp and cotton weft, or of wool mixed with a portion of cotton. Heavy winseys are used for skirtings, light winsey for men's shirts. The word is believed to be shortened from *linsey-winsey*, a jingling modification of *linsey-woolsey*.

Winslow, EDWARD, governor of Plymouth colony, Massachusetts, was born in 1595 at Droitwich, sailed in the *Mayflower*, was either assistant-governor or governor from 1624, and thrice returned to England to describe the colony, or defend it against its accusers. He thus came to publish his *Good Newes from New England* (1624), *Hypocrisie Unmasked* (1646), and *New England's Salamander* (1647), all three valuable accounts of the young colony. Appointed by Cromwell chief commissioner of an expedition against the West Indies, he died at sea in 1655.—His son, JOSIAH (1629–80), was assistant-governor from 1657 to 1673, and then governor till his death. In 1675 he was chosen general-in-chief of the United Colonies; and under him the first public school was established in 1675. —His grandson, JOHN (1702–74), carried out, under orders, the removal of the Acadians (see ACADIA); and John Ancrum Winslow (1811–73), descendant of one of Edward Winslow's brothers, commanded the *Kearsarge* in her action with the *Alabama* (q.v.), and died an admiral.

Winsor, JUSTIN, born at Boston, Massachusetts, in 1831, studied at Harvard and at Heidelberg, was librarian at Boston 1868–77, and afterwards at Harvard, and has published various bibliographical works, and edited the *Memorial History of Boston* (4 vols. 1880–81), and a valuable but somewhat chaotic compilation, *The Narrative and Critical History of America* (8 vols. 1884–90). In 1891 he issued a Life of Columbus. He died 22d October 1897.

Winston, a town of North Carolina, 218 miles SW. of Richmond in Virginia, with tobacco-factories. Pop. (1880) 2854; (1890) 8018.

Wint, PETER DE, water-colourist, was born at Stone, Staffordshire, 21st January 1784, the son of a physician, sprung from a Dutch family settled in New York. He was trained to be a mezzotint engraver under J. R. Smith, but soon took to painting both in oil and water-colours, and his fame rests on his beautiful water-colour illustrations of English landscape, English architecture, and English country-life. Lincoln (where he found a wife), Yorkshire, and parts of Derbyshire were the regions he loved best; but he painted scenes on the Thames, the Trent, and in Wales and elsewhere. He exhibited mainly in the rooms of the Old Water-colour Society, and is well represented both in the National Gallery and at South Kensington. He died at London (where he had mostly lived), 30th June 1849. Among his most famous pictures are 'The Cricketers,' 'Lincoln Cathedral,' 'The Hay Harvest,' 'Nottingham,' 'Richmond Hill,' 'Cows in Water.' 'A Cornfield' and 'A Woody Landscape' are oils at South Kensington.

See the Memoir by Walter Armstrong (1888), and Redgrave's *David Cox and Peter de Wint* in the 'Great Artists' (1891).

Winter. See SEASONS, EARTH.

Winterberry, a name given to several shrubs of the genus Ilex, growing in the eastern parts of North America. *I. verticillata*, the Virginian Winterberry, has white flowers in clusters, and bright scarlet berries that remain after the fall of the leaf. The bark is astringent and tonic.

Winter-cherry, the *Physalis alkekengi*, one of the Solanaceæ, with edible red berries, also called in the United States Strawberry-tomatoes. *P. peruviana*, or Peruvian Gooseberry, has yellow berries. The name is given too in the United States to the *Cardiospermum halicacabum*, also called Balloon Vine, from the large, triangular, inflated fruit.

Wintergreen. See GAULTHERIA. The oil of wintergreen, named from this plant, is an aromatic stimulant, used chiefly in flavouring confectionery and syrups; and is now obtained from the sweet birch as frequently as from the wintergreen plant. The name is also given to plants of the genera Pyrola and Chimaphila, herbaceous or half-shrubby plants. The twenty species of Pyrola are found throughout the northern hemisphere, several species being natives of Britain; the species of Chimaphila, found in North America, are sometimes distinguished as spotted wintergreen. Both *Gaultheria procumbens* and a low-climbing plant, *Mitchella repens*, are called Checkerberry in the United States.

Winter's Bark, a stimulant, aromatic, and tonic bark, named from Captain Winter, who first brought it from the Strait of Magellan in 1579. It is the produce of *Drimys Winteri*, a native of some of the mountainous parts of South America, and abundant in the lower grounds of Cape Horn and Staten Island—a magnoliaceous evergreen shrub with laurel-like leaves and corymbs of white flowers. The Star Anise (Illicium) is nearly allied to it. The bark of other species of Drimys has properties similar to those of Winter's bark, as that of *D. Granatensis*, much used in Brazil, and of *D. axillaris*, a New Zealand tree.

Winterthur, a town of Switzerland, on the Eulach, 17 miles by rail NE. of Zurich, with thriving manufactures of locomotives, and of cotton,

silk, and woollen goods, &c. It contains a good town-hall, industrial schools, a museum of Roman antiquities, and a public library of 20,000 vols. Pop. (1888) 15,956. The Roman *Vitodurum* (now Ober-Winterthur), it was held by the Counts of Kyburg (castle 4 miles off), and then by the Hapsburgs, who sold it to Zurich in 1467. See History by Troll (Vienna, 1842–43).

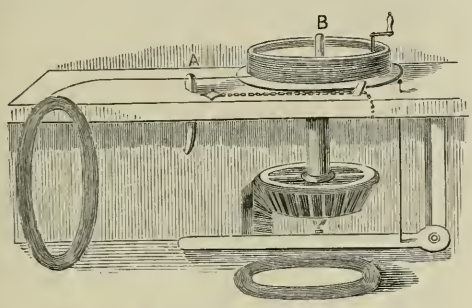
Winthrop Family.—JOHN, governor of the colony of Massachusetts, was born at Groton, near Hadleigh, in Suffolk, England, January 22, 1588, was bred to the law, appointed justice of peace at the age of eighteen, and on account of his excellent and pious character was in 1629 elected by the governor and company of Massachusetts Bay to govern their colony. He landed at Salem, with the colony's charter and a fleet of eleven ships, on June 22, 1630. He was re-elected governor every year until 1634. In 1636 he became deputy-governor under Sir Harry Vane, with whom he had an animated controversy on the doctrines of Mrs Hutchinson. In 1637 he was elected over Sir Harry, and continued governor, with a brief interval, during his life, and had more influence probably than any other man in forming the political institutions of the northern states of America. He died at Boston, March 26, 1649. Winthrop kept a careful journal, the first part of which was published in 1790, and the whole in 1825–26 (new ed. with additions, 1853). See his *Life and Letters*, by R. C. Winthrop (Bost. 1864–67).—JOHN, governor of Connecticut, eldest son of the preceding, was born at Groton, England, February 12, 1606; educated at Trinity College, Dublin; made the tour of Europe; went to America in 1631, and was chosen a magistrate in Massachusetts; in 1635 went to Connecticut and built a fort at the mouth of the Connecticut River, being governor of the colony for a year; and founded the city of New London in 1646, settling there in 1650. In 1657 he was elected governor, and, with the exception of one year, held that post till his death. He obtained from Charles II. a charter which united the colonies of Connecticut and New Haven, and was named first governor under it; and he was the father of the paper currency in America. He was a student and a scholar, a fellow of the Royal Society, a Puritan without bigotry, and just and even lenient to those of other religious opinions. He died at Boston, April 5, 1676.—His son, also JOHN, but known as Fitz-John (1639–1707), served under Monk and in the Indian wars, was agent in London for Connecticut (1693–97), and governor of the colony from 1698 till his death. See the *Winthrop Papers* (Mass. Hist. Soc., 1889).—JOHN, LL.D., American physicist, a descendant of the first Governor Winthrop, was born at Boston in 1714, graduated at Harvard in 1732, and in 1738 was appointed professor of Mathematics and Natural Philosophy there. In 1740 he observed the transit of Mercury, and in 1761 he went to Newfoundland to observe the second transit in the century. He published papers on earthquakes, comets, and other subjects, was a fellow of the Royal Society, and died May 3, 1779.—ROBERT CHARLES, LL.D., American orator, descendant of the sixth generation from the first Governor Winthrop, was born at Boston, May 12, 1809, graduated at Harvard in 1828, studied law with Daniel Webster, and was admitted to the bar in 1831, but soon abandoned law for politics, and was elected to the state legislature in 1834, where he served till 1840. He then was elected to congress, of which he was a member for ten years, and in 1847–49 was its speaker. In 1850 he succeeded Webster, who became Secretary of State, as senator from Massachusetts, but lost his seat in 1851; and in the same year he was also defeated as a candidate for governor of Massachusetts. He spoke admirably on historical occasions (see his *Addresses and Speeches*, 4 vols. 1852–86), and published, besides the Life of the first John Winthrop, a volume on *Washington, Bowdoin, and Franklin* (1876). He died on 16th November 1894. See the Life of him by his son (1897).

Winzet, NINIAN, was born at Renfrew in 1518. It is probable that he was educated at the university of Glasgow; and he was certainly ordained priest in 1540. About 1552 he was appointed master of the grammar-school at Linlithgow, where he also acted as a notary, and was eventually promoted to the provostry of the Collegiate Church of St Michael's. On the establishment of Protestantism in Scotland (1560) Winzet, who adhered to the old religion, was deprived of his various offices, and came to Edinburgh, where he received the countenance of Queen Mary. It was now that he wrote his pamphlets entitled *Certane Tractatis for Reformatioun of Doctryne and Maneris*, which have given him an honourable place among Scottish Catholics posterior to the Reformation. Forced to quit Scotland in 1563, he made his home in the university of Paris till 1571, when he was summoned to England to perform certain services to Mary who was now in captivity. Returning to Paris the same year, he became a teacher of some distinction in the university, holding thrice in succession the office of Procurator of the German Nation. In 1574 he removed to the English College of Douay, where he became licentiate in theology, and in 1577 his learning and various services to the church were rewarded by his appointment as Abbot of St James's, Ratisbon. In this office, which he discharged with characteristic energy and fidelity, he died in 1592.

See Irving, *Lives of Scottish Writers*, and Winzet's Works (1891), edited for the Scottish Text Society by the Rev. J. K. Hewison, who has brought together all that is known regarding Winzet and his writings.

Wire. Specimens of metallic shreds dating as far back as 1700 B.C. are stated to have been discovered; whilst a sample of wire made by the Ninevites about 800 B.C. is exhibited at the Kensington Museum, London. Mention of a similar product is made by both Homer and Pliny. Wire was originally made by beating metal into plates, which were cut into narrow strips, and subsequently rounded by hammering. The art of wire-drawing was not practised until the 14th century, or introduced into Great Britain till some three centuries later. The facility with which any metal can be drawn into wire depends upon its ductility. Most metals possess this property; though some, like bismuth and antimony, are so brittle that they can only be drawn out with difficulty, and wire made from such metals is useless from want of tenacity (see DUCTILITY). The general principle involved in the manufacture of wire consists in rolling down ingots or bars into rods of say ¼ inch diameter, which are afterwards attenuated and reduced in section by being drawn cold through holes in metal plates or hard stones. The accompanying illustration represents a wire-drawer's bench, A being the draw-plate, and B the drawing-block or cylinder; driven by a prime mover through the gearing as shown. The draw-plate, A, is generally made of hard steel, the holes in it being funnel-shaped. Owing to the excessive friction generated, notwithstanding the use of lubricants, the holes rapidly wear away and enlarge. After being once drawn, the wire is again passed through a smaller hole in the draw-plate, and so the process is repeated until the required size is reached. Fine wire may require from twenty to thirty drawings. The speed of the drawing-cylinder is increased as the diameter of the wire diminishes. The metal under treatment gradually

hardens, and becoming less ductile requires *annealing*, after which it is washed in an acid solution and subsequently steeped in lime-water. The ductility of the metal and the diameter of the wire determine the rapidity with which drawing can be



Wire-drawer's Bench.

effected. Iron and brass can be drawn at a speed of from 12 to 45 inches per second, gold and silver fine sections at from 60 to 70 inches per second. Where great accuracy is required, as in chronometer springs, and for gold and silver laces, platinum wire, &c., perforated rubies, or similar hard stones, are fitted to the draw-plate. A silver wire, 170 miles long and about $\frac{1}{300}$ of an inch in diameter, has been drawn through a hole in a ruby, and found by a micrometer to be exactly the same size at the end as at the beginning; whereas the drawing of a length of 16 miles of brass wire through a steel draw-plate necessitates a readjustment of the hole.

Iron was formerly used to a considerable extent for wire, but has been largely superseded by steel. The ultimate tensile strength of steel wire ranges from 40 to 170 tons per square inch of sectional area. Wire gauges are, unfortunately, numerous, and apt to cause confusion. A treatise by Hughes in 1879 mentions no less than fifty-five different gauges, forty-five of which were for measuring or determining the sizes of wire manufactured and sold within the United Kingdom. In 1857 Sir Joseph Whitworth introduced his gauge, ranging from $\frac{1}{2}$ an inch to $\frac{1}{1000}$ of an inch by regular gradations of thousandths of an inch, No. 1 being ·001 of an inch, and No. 500 being ·500 of an inch. The Birmingham wire gauge had also extended application. In 1884 the imperial standard wire gauge, ranging from 7/0 = ·500 inches to 50 = ·001 inches, was mutually agreed upon as a much desired and uniform gauge, and became law.

The annual production of wire and wire products is enormous, the industry being chiefly seated in the United States (see, e.g., WORCESTER), Great Britain, Germany, and Belgium. The dimensions to which the trade has grown may be judged from the annual output—some 50,000 tons—of one of the leading continental firms. A bare enumeration of the many and varied purposes to which wire is applied, ranging from a pin to a 12-inch hawser, would form a formidable list; whilst each year witnesses its further extended employment in every branch of industry. The one item of barbed wire alone—a comparatively recent introduction for fencing purposes—represents an annual output in America and Europe estimated at over 100,000 tons. According to official returns, there are about 184,000 miles of telegraph wire in the overland service of Great Britain; whilst the Western Union Telegraph Co., U.S.A., have some 648,000 miles of wire in their system alone. With few exceptions pins are made of brass wire, and the production of these has been estimated at no less than 50 millions per day in Great Britain alone.

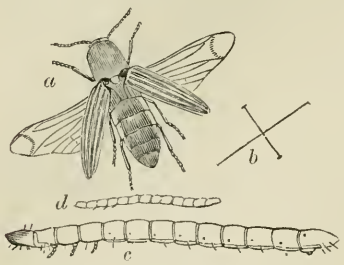
Wire furnishes an interesting example of the increase in value of a raw material through the labour put upon it. Professor Babbage drew attention to the fact that one pound of iron, originally valued at twopence, would yield 50,000 hair-springs for watches, each weighing about one-seventh of a grain, and selling at a retail price of twopence apiece, or over £400 in all.

WIRE-ROPES are now extensively employed in many trades and industries, superseding hemp-ropes and chains. They seem to have originated in Germany about 1821, and in the suspension bridge at Geneva, built in 1822, ropes of parallel and untwisted wire, bound together on the 'selvagee' method, were employed. Some fifteen years later 'formed' or 'stranded' wire-ropes were manufactured and employed in the Harz mines. Formerly wire-ropes were made from high-class iron; but steel is now almost universally employed in their manufacture. Wire-ropes are stranded and laid or closed in machines differing only in detail from those employed for making ordinary hemp ropes, both vertical and horizontal types of revolving machine being used. In the manufacture of the heavier wire-ropes the great weights manipulated necessitate a correspondingly massive design of plant. A wire-rope 'strand' generally contains from six to nine wires, and never more than eighteen. A 'laid' rope consists of a heart (a strand either of hemp or wire), around which are twisted six strands containing a similar heart, usually covered with six wires. A 'formed' rope comprises six strands laid round a heart, but each strand consisting of eighteen wires in addition to the core. A 'cable laid' rope is composed of six laid ropes closed together to form one cable. Wire-ropes are generally galvanised to prevent rust, by being drawn through an alkaline or acid liquor, and thence through the galvanising bath of molten 'spelter,' any superfluous metal being removed from the ropes by their subsequent passage through a bed of sand. Judicious oiling at intervals reduces the cutting action of the wires against each other and lengthens the life of the rope. The applications of wire-ropes are almost numberless, and are constantly increasing. For winding and hauling purposes in mines, &c., wire-ropes are very largely used. The vertical winding ropes used in British mining operations commonly range from $3\frac{1}{2}$ to $4\frac{1}{2}$ inches in circumference; they are wound on drums from 20 to 30 feet in diameter and at speeds of from 2000 to 2500 feet per minute.

In the United States and Australia hundreds of miles of street and other railways are operated by wire-cable traction, whilst some British cities also possess cable tramways. For aerial ropeways wire-ropes are extensively and successfully employed in all parts of the world. Besides their permanent employment in suspension bridges, such as the Brooklyn Bridge (see BRIDGE, p. 445), wire-ropes furnish valuable aid in the erection of large bridges, and were largely used in connection with the Forth Bridge and the Sukkur Bridge across the Indus. In the first-named structure no less than 60 miles of wire-roping were temporarily employed. For marine, electrical, and kindred purposes, in addition to many others too numerous to detail, wire-ropes are very extensively used. The strength of the steel wire used for ropes ranges from 70 to over 100 tons per square inch of sectional area. To attain equal strength the weight of a hemp rope may be taken at about three times, and that of a chain at about five times the weight of a steel wire-rope. See J. Bucknall Smith, *Wire: its Manufacture and Uses* (1891).

Wire-worms, the grubs of click beetles (Elater or Agriotes), perhaps the most injurious of farm

pests, destroying root, grain, and fodder crops. They are called wire-worms 'from their likeness in toughness and shape to a piece of wire;' they are yellowish in colour, from ¼ to ½ an inch in length, with three pairs of legs, and a suctorial appendage below the tail. The adults are skip-jack or click beetles common in the fields in summer-time. The eggs are laid near the roots of plants, in the ground or in the axils of basal leaves; the grub remains for several years (three to five) as such, burrowing in the ground during the frost of winter, but at other times hardly ceasing from voracious attacks on the roots and underground stems of all sorts of crops. Eventually they pupate in the soil, whence the adult beetle emerges. Common forms are *Agriotes obscurus*, *A. lineatus*, *A. sputator*. They are not to be confused with millipedes, which they slightly resemble. For prevention Miss Ormerod recommends lime-compost, guano and superphosphate, soot, nitrate of soda and salt, and other obnoxious dressings, summer fallow, and burning all rubbish, clod-crushing and heavy rolling. On a small scale slices of potatoes or turnips may be successfully used as traps. Among natural enemies of wire-worms moles, rooks, plovers, and pheasants are important.



Wire-worm:
a, perfect insect magnified; *b*, natural size of perfect insect; *c*, wire-worm magnified; *d*, natural size of wire-worm.

Wisbech, a market-town of Cambridgeshire, in the Isle of Ely, on the Nene, 21 miles ENE. of Peterborough, 13 SW. of Lynn, and 40 N. of Cambridge. The parish church, Norman to Perpendicular in style, has a fine tower; and there are a corn exchange (1811), a cattle-market (1869), a town-hall (1873), the Cambridgeshire hospital (1873), a museum and literary institute, and a public park of 18 acres. A castle, founded by the Conqueror in 1071, was rebuilt by Bishop Morton in 1483, restored by Bishop Andrewes in 1617, and again rebuilt from Inigo Jones's designs by Thurloe, Cromwell's secretary, but was demolished in 1816. Visited by King John and Edward IV., it was the prison under Elizabeth of many Catholic recusants, including Bishops Wishart and Watson, the Jesuit Weston, Dr Bagshaw, Catesby, and Tresham (T. G. Law's *Conflicts between Jesuits and Seculars*, 1890). Godwin was a native, and Clarkson, to whose memory a Gothic cross by Sir G. G. Scott was erected in 1881. Vessels of nearly 500 tons can now ascend the Nene from the Wash (7 miles); and Wisbech exports cereals, imports timber, and manufactures iron, oil, ropes, &c. It was long famous for its woad, and woad is still made here for dyeing. It was made a municipal borough in Edward VI.'s reign. Pop. (1851) 10,089; (1891) 9395.

See W. Watson's Historical Account of Wisbech (1827); History of Wisbech (1833); 'Wisbech Castle' in the *Journ. Brit. Arch. Assoc.* (1879); and Miller's *Fenland Past and Present* (1878).

Wisby, a once famous seaport on the west coast of the Swedish island of Gothland (q.v.), 130 miles S. of Stockholm. One of the most important commercial cities in Europe during the 10th and 11th centuries, during the 14th and 15th it was a principal factory of the Hanseatic League (q.v.). The eastern trade, which during the 11th and 12th centuries passed through Russia, and thence down the Baltic to Gothland, centred in Wisby, and greatly enriched that port. In 1361 Valdemar III. of Denmark took the town by storm, and, plundering it, obtained an immense booty. This was a fatal blow to the prosperity of the place. The architecture of Wisby is exceedingly interesting. Its ancient walls and towers exist in almost as entire a state as they were in the 13th century, and render its appearance, as seen from the sea, exceedingly striking. The early grandeur of the town is attested by the fact that it contains, well preserved, the remains of ten churches, all of which date from the 11th and 12th centuries, are varied in form and ornament, and are a mine of interest to the student of Early Gothic. The oldest is the church of the Holy Ghost (1046). St Mary's (1190–1225) is the only church now kept up for the use of the inhabitants. Pop. 6666.

Wisconsin, the twentieth in area and fourteenth in population of the United States, lies between Lakes Michigan and Superior and the Mississippi River, with its tributary the St Croix; the surrounding states are Michigan, Minnesota, Iowa, and Illinois. Its length is about 300 miles and its breadth 250, with an area of 56,040 sq. m. The surface is a rolling plain with an elevation of 600 feet, rising to 1800 feet at the divide, about 30 miles south of Lake Superior. The general slope is south-westward towards the Mississippi, into which four-fifths of the streams flow. The principal of these are the Chippewa, the Black, and the Wisconsin, which furnish abundant water-power. The Fox, which occupies part of the same valley with the Wisconsin, flows north-eastward into Green Bay. It also passes through Lake Winnebago, the largest lake entirely within the state (28 miles by 10). There are about two thousand small lakes, often with picturesque outlets through narrow rocky gorges called 'dells,' or in the north forming rapids or cascades. These lakes are a striking proof of extensive glacial action, and a range of hills, the Kettle moraine, marks the edge of the enormous bed of ice which once covered all the state except the south-western part, called by geologists the 'driftless area.' The Archæan rocks of the northern part of the state testify that this was the oldest part of the continent. Next come the Huronian rocks, containing valuable beds of iron ore, and intermixed in the north-west with the copper-bearing formation of Lake Superior. To the south are sandstone and limestone formations, furnishing excellent building material, and in the south-west containing lead and zinc ores. Dense forests, consisting chiefly of white pine and other coniferous trees, but having also oaks and other deciduous trees, once covered most of the state, though the southern part is prairie land, with many oak groves or 'openings.' The present forest area is 48·8 per cent. of the whole (but see TIMBER, p. 211). The average annual temperature of the state is 42°, but in the southern part it is 46°.

Copyright 1892 in U.S. by J. B. Lippincott Company.

The chief industry in the state is agriculture, employing about 400,000 persons. In 1891 the grain-product was valued at $38,849,322. In the product of lumber Wisconsin ranks third among the states, the amount in 1885 being valued at $27,000,000, while the manufactures of wood were valued at $14,000,000, and those of wagons, &c. at $5,000,000. In the lumber regions extensive conflagrations sometimes occur, the most disastrous being in October 1871, when the fire swept over portions of eight counties and destroyed a thousand lives. In iron-mining Wisconsin holds

the sixth rank, its product being over 116,000 tons of pig-iron and 60,000 tons of rolled iron. Manufactures of leather amount to $9,000,000; and beer is produced, chiefly at Milwaukee, to the value of $11,000,000 annually. Wisconsin is divided into sixty-eight counties, and sends nine representatives to congress. Education is liberally supported. The University of Wisconsin, founded at Madison in 1850, had in its several colleges at the end of the century 125 instructors and 5800 students. The state has also normal schools and an excellent system of public schools. The state capital is Madison, the leading commercial city Milwaukee. Other cities are La Crosse, Oshkosh, Racine, Eau Claire, Sheboygan, Fond du Lac, Superior, Appleton, Marinette, Janesville.

Artificial earth-mounds (see MOUND BUILDERS), some in the form of animals, as the turtle and buffalo, are the earliest works of man in Wisconsin. Jean Nicollet was the first white man who visited the state, having entered the Fox River in 1634. In 1665 a Jesuit mission was founded on Green Bay, and French fur-traders soon established trading-posts. Upon the conquest of Canada in 1763 Wisconsin passed under British control, which lasted practically till 1815. Wisconsin Territory, when formed in 1836, extended as far as the Dakotas; but in 1838 the Mississippi was made its western boundary. Ten years later it was admitted as a state. Special efforts were made to attract immigration by the offer of cheap lands, and the result has been an unusually large foreign element in the population—chiefly German and Scandinavian, but including also French and Swiss. Many of these foreigners settled in communities, which have tenaciously preserved their original language and customs. Roman Catholics form the most numerous religious body, followed successively by Lutherans, Methodists, Congregationalists, and Baptists. The first railroad was built in 1850; in 1898 there were 6240 miles. During the civil war Wisconsin furnished to the Federal army 91,327 soldiers. Pop. (1850) 305,391; (1870) 1,054,670; (1880) 1,315,477; (1890) 1,686,880; (1900) 2,068,963. Besides a few civilised Indians, there still remain in the state about 9000 tribal Indians, mostly Chippewas, on 416,800 acres of reservations.

Wisconsin, a river of Wisconsin, rises on the northern frontier, and flows nearly 600 miles south and west to the Mississippi. It is broken by many rapids and falls, but is navigable to Portage City, where a short canal connects with the Fox River, so that there is steamboat communication between Lake Michigan and the Mississippi.

Wisdom, BOOK OF. See ECCLESIASTICUS, SOLOMON.

Wiseman, NICHOLAS PATRICK, Cardinal and Roman Catholic Archbishop of Westminster, was born 2d August 1802, at Seville, of an Irish family settled in Spain. He was brought to Ireland in his childhood, and received his first education at Waterford, whence he was removed to the Roman Catholic college at Ushaw near Durham. In his sixteenth year he entered the English College at Rome, received holy orders at Rome in 1825, and was made S.T.D. and vice-rector of the college. In 1828 he published his *Horæ Syriacæ*, and became rector. As such in Rome he delivered his *Lectures on the Connection of Science and Revealed Religion* (1836); in London he first became known by a series of lectures on *The Doctrines of the Catholic Church* (1836). In the same year he was mainly instrumental in establishing the *Dublin Review*. In 1840 he was named Coadjutor Vicar-apostolic of the Central District of England, with the title of Bishop of Melipotamus *in partibus*, and appointed president of St Mary's College at Oscott. In 1846 he was transferred as Coadjutor Vicar-apostolic to the London district. From shortly after the Reformation the Roman Catholic Church in England had resorted to the expedient of a system of bishops *In Partibus Infidelium* (q.v.), with the title and authority of Vicars-apostolic (q.v.); but from the date of the passing of the Catholic Emancipation Act a desire had gradually sprung up among Catholics for the restoration of the normal form of church government by the establishment of a regular hierarchy. This measure was finally determined on by the pope in the year 1850, and Dr Wiseman was named archbishop of the see of Westminster, being at the same time created cardinal. This measure called forth a storm of religious excitement, which led to the passing of the futile Ecclesiastical Titles Assumption Act (q.v.). During the excitement Wiseman published an explanatory address of great ability and moderation entitled *An Appeal to the Reason and Good Feeling of the People of England on the Subject of the Catholic Hierarchy*. Notwithstanding these unfavourable circumstances, the undoubted abilities and literary eminence of Cardinal Wiseman eventually compelled the admiration of the British public. He took frequent occasion, moreover, by public lectures and addresses on the neutral subjects of education, literature, and art, to identify himself with the spirit of progress, and with the national sentiments of his fellow-countrymen; and in spite of failing health he published a succession of works which possessed much congenial to the sympathies of all cultivated Englishmen. The *Lectures on Religion and Science* already referred to; *On the Connection between the Arts of Design and those of Production;* on the *Influence of Words on Thought and Civilisation;* on the *Points of Contact between Science and Art; Recollections of the Last Four Popes*, and other similar works, obtained an extensive circulation. He died in London, 15th February 1865. He was a scholar of rare and various attainments, a distinguished orator, a graceful and vigorous writer, and an accomplished critic. In addition to the works mentioned above, he published *The Real Presence in the Eucharist* (1836); *Reply to Dr Turton on the Eucharist* (1839); *Lectures on the Ceremonies of Holy Week* (1839); *Essays on Various Subjects* (3 vols. 1853); *Fabiola, or a Church of the Catacombs* (1854), a singularly life-like picture of early Christian life in classic Rome; *Sermons* (2 vols. 1864); with many polemical tracts and other short publications. In 1866 appeared *The Witch of Rosenburg, a Drama in Three Acts;* and *Daily Meditations* in 1868. See the Lives by G. White (1865) and by Wilfrid Ward (2 vols. 1897).

Wiseman, RICHARD, surgeon to Charles II. (died 1679). See SURGERY, Vol. IX. p. 818; and the monograph by Sir T. Longmore (1892).

Wishart, GEORGE, the martyr, was born in the opening years of the 16th century. He belonged to the family of Pittarrow in Forfarshire, his eldest brother being clerk of justiciary and king's advocate. Though so well-known a figure in Scottish history, few facts of his life have come down to us. In 1538 he was acting as schoolmaster in Montrose, where he incurred a charge of heresy for teaching the Greek New Testament. The following year we find him in Bristol, and again in connection with heresy, of which he had to make public abjuration in the church of St Nicholas in that city. The next few years he spent on the Continent, chiefly in Germany and Switzerland, a memorial of which sojourn is his translation of *The Confession of Faith of the Churches of Switzerland*. In 1543 he was residing in Corpus Christi College, Cambridge, where he had as one of his students a certain Emery Tylney, who has described his tutor as 'a

man of tall stature, polde headed, and on the same a round French cap of the best; judged of melancholy complexion by his physiognomie; blackehaired, long-bearded, comely of personage, well spoken after his countrey of Scotland; courteous, lowly, lovely, glad to teach, desirous to learne, and was well travailed.' In 1544 or 1545 Wishart accompanied a commission sent to Scotland by Henry VIII. in connection with the marriage of his son Edward and Mary Stuart. The story of the next two years, the last of his life, told as it is by Knox in his most graphic style, has made Wishart one of the memorable characters of Scottish history. With an enthusiasm and eloquence which filled Knox with admiration, Wishart preached the Lutheran doctrine of justification by faith as opposed to the Catholic doctrine of good works, wherever he could gather a congregation to listen to him. His chief centre was Dundee, though he also found many supporters in Montrose, in Ayrshire, and East Lothian. At this period Cardinal Beaton was supreme in the councils of the nation. Through the schemes of Henry VIII., heresy in Scotland had inevitably assumed a political character, the friends of the new religion looking to England as their strongest ally, while the supporters of the old church as naturally looked to France. Both as a churchman and as a politician, therefore, Beaton sought Wishart's death, nor did he wait long before compassing his end. At his instance Wishart was arrested at Ormiston on the 16th January 1546, and hanged and burnt at St Andrews on the 12th March of the same year. Three months later Beaton was himself assassinated, his death being undoubtedly in some part due to his merciless dealings with Wishart. After Knox and Andrew Melville, Wishart is the most outstanding figure among the Scottish reformers of the 16th century. By his own labours as a preacher, the tragic manner of his death, by the fact that Knox was first inspired by his teaching and influence, he is to be regarded as one of the leading agents of the Reformation in Scotland.

See David Laing, *Works of John Knox* (vols. i. and vi.); Lorimer, *Precursors of the Reformation*; Dr C. Rogers, *Life of Wishart* (Edin. 1876); Tytler, *History of Scotland* (vol. iii.); Maxwell, *Old Dundee* (1891). In the last two books the question is fully discussed whether Wishart was a Scotsman of that name who was concerned in a proposal made to Henry VIII. for the assassination of Cardinal Beaton. As the question at present stands, no satisfactory decision can be given.

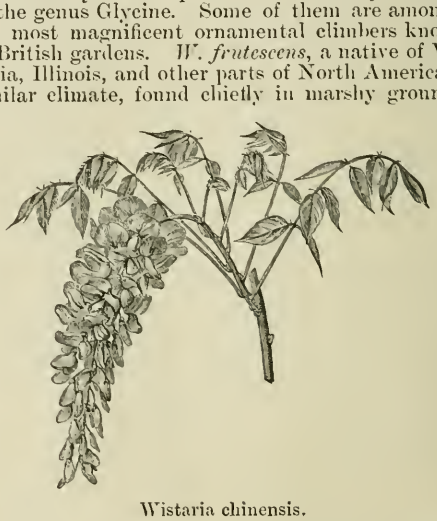
Wishaw, a thriving town of Lanarkshire, 3½ miles ESE. of Motherwell and 15 of Glasgow. Founded in 1794, it was constituted a police-burgh in 1855, and since 1874 has comprised also the villages of Cambusnethan (Lockhart's birthplace) and Craigneuk. Coal-mining is the staple industry, and there are also ironworks. Pop. (1881) 13,112; (1891) 15,252.

Wislicenus, JOHANNES, chemist, born near Querfurt in Prussian Saxony, 24th June 1835, taught chemistry at Cambridge (U.S.), New York, Zurich, and Würzburg, and in 1885 went to Leipzig as professor. He has done important work in connection with the Atomic Theory, Alcohols, Acids, &c., and has edited a handbook of chemistry (1874–77).

Wismar, the second seaport of Mecklenburg-Schwerin, on the Baltic, at the head of a bay of the same name, 20 miles by rail N. of Schwerin. It has an excellent harbour, carries on an active oversea trade, and has varied manufactures. Of the walls only four gates remain; but the numerous quaint old houses are a feature of the place, and several of the brick churches, as well as the Fürstenhof, once a ducal residence, date from the 14th and 15th centuries. It was a Hanse town in the 13th century, passed to Sweden in 1649, was taken by the Danes in 1675, and by the Danes, Prussians, and Hanoverians in 1712, when its strong fortifications were destroyed, and in 1803 was pawned to Mecklenburg-Schwerin, which secured it finally in 1828. Pop. 15,797.

Wissembourg (German *Weissenburg*), till 1871 a French fortified town, close to the frontier of the Bavarian palatinate, now a manufacturing town in the German district of Lower Alsace, is on the Lauter, 42 miles NNE. of Strasbourg by rail; pop. 5968. It grew up round a 7th-century Benedictine abbey, and in 1677–97 was ceded to France. Here was fought, on the 4th August 1870, the first great battle of the Franco-German war, in which the Germans were victorious (see FRANCE, Vol. IV. p. 782). The Lines of Wissembourg, originally made by Villars in 1706, are famous—a line of works extending to Lauterburg 9 miles SE. Like the fortifications of the town, those of the lines have now disappeared.

Wistaria, a genus of plants of the natural order Leguminosæ, sub-order Papilionaceæ, having pinnate leaves and flowers in terminal racemes, the pod leathery. The species were formerly included in the genus Glycine. Some of them are amongst the most magnificent ornamental climbers known in British gardens. *W. frutescens*, a native of Virginia, Illinois, and other parts of North America of similar climate, found chiefly in marshy grounds,



Wistaria chinensis.

attains the height of 30 feet, and has beautiful racemes of fragrant bluish-purple flowers. *W. chinensis* or *consequana*, a native of China, has larger flowers in pendulous racemes, and its branches run to the length even of 90 feet. In Britain these plants are generally trained on walls.

Witchcraft. The philosophy underlying the ancient belief in the reality of witchcraft has been already set forth under the heads of DEMONOLOGY, DIVINATION, MAGIC, &c.; here it remains only to discuss the history of this, the most lamentable of human superstitions, as modified by Christianity, the causes of its extraordinary prevalence in the 14th, 15th, 16th, and 17th centuries, and of its gradual decay before the growing light of rationalism and the modern secularisation of the human intellect. A deeply rooted popular superstition adapts itself successively to every form of religious faith, and we soon find all the sorcery of the ancient heathen world imbedded in Christianity itself, and turned to new account in the popular conception of the function of the devil. The fundamental cause of belief in magical processes is the elemental confusion made by the primitive mind between

Copyright 1892 in U.S. by J. B. Lippincott Company.

subjective and objective relations, between the *post hoc* and the *propter hoc*, the scanty knowledge of natural causes being filled up with hypothetical causes of a metaphysical and supernatural character. Magic depends on occult faculties and devices within the control of the magician, who thus becomes gradually differentiated from the priest, as the possessor of the illegitimate rather than the legitimate means of communication with the unseen. The most rudimentary religions soon come to develop an ethical side; magic, on the other hand, stands apart from the ordinary adoration of spiritual powers, employing theurgy, thaumaturgy, spells, incantations, occult devices, rather than prayer, inspiration, oracles, miracles, and omens. Worship is essentially *rational*, the natural effect of an assumed theory of the unseen and spiritual, capable of being worked out into a theology; sorcery, on the other hand, is essentially *supernatural* and *supra-rational*, affording no adequate basis for a systematised theory. At the same time some of its observed phenomena may form a foundation out of which a special pseudo-science may be built up, as in the theory of augury, astrology, oneiromancy, and divination; but these harmonise into no broad synthesis of a spiritual philosophy, and cannot form foundations for a religion. Sorcery then is ever mysterious, occult, and dreadful, and under its sway man continues to be the sport of the gloomy intellectual and spiritual shadows his imagination ever generates out of the mists of the unknown, imperfect analogy—the foundation of all false philosophy—perverting by a false twist at the outset even man's intellectual faculties, and completing the process by leaving his mind a prey to the wildest vagaries of imagination. It may also be the case that the complex nature of man ever craves for an irrational and supra-sensible element—a material support—around which to cling, and that this remains a necessity to the most highly developed religious sense as well as the most rudimentary. To make the image of a thing is to reproduce it, and it is impossible to distinguish sharply between the visible representation of an object and its invisible and spiritual realisation. To burn an unpopular politician in effigy, to cherish a lock of hair of one we love, to reverence a Madonna and Child in our churches is not a whit more rational, or less irrational rather, than to torture an enemy by slowly burning his wax image or to raise a storm at sea by whipping a bucket of water with a switch. For to human nature in its ordinary conditions the symbol is necessary to any adequate or lasting realisation of the thing symbolised, and when once imperfect analogies and the confounding of the subjective and the objective are admitted, any perversity of imagination in the assumption of supra-sensible relations between things is intelligible enough. The symbolical is apt to be confused with the magical infliction of injury upon an enemy in such Scripture instances as the arrows shot thrice by King Joash on the ground in order to smite the Syrians (2 Kings, xiii.15–18), and in the horns made by Zedekiah with which to push Syria (2 Chron. xviii. 10); while possibly a parallel may be drawn between the practice of making land barren with enchanted stones and one part of the ruin appointed for Moab (2 Kings, ii. 19–25).

We find then a belief in the possibility of sorcery everywhere in the ancient world—among the Chaldeans and the unimaginative Romans alike—and in Hebrew history the contest between Moses and the Hakhāmīm, or wise men of Egypt, suggests that wonders could be wrought by the *Elohim Acherim* or 'other gods.' The traditional contest between St Peter and Simon Magus in the earliest Christian times shows the same belief; and we find the Fathers all unanimous in this at least, that the fact of sorcery is supported by the strongest scriptural and ecclesiastical authority. The notion of a supreme embodiment of evil, at the head of the whole hierarchy of hell, from the beginning was embodied in Christian belief, and thus the whole human world came naturally to be regarded as ringed round with a countless host of malignant spirits whose work was none other than to thwart the divine purposes by leading men into the rebellion of sin. The ministry of Satan in the trial of Job, the werewolf-like transformation of Nebuchadnezzar, the necromancy of the Witch of Endor raising up the majestic shade of Samuel to pronounce the doom of Saul, the New Testament stories of demoniacal possession, and of the dispossessed devils entering into the Gadarene swine and rushing down a steep place with them into the sea—all these, superinduced upon the elemental belief in sorcery, went to form the Christian conception of witchcraft. Even a Scripture phrase like the 'prince of the power of the air' found only too literal an interpretation in the notion of the transportation of witches through the air to the unholy Sabbath. And of atmospheric phenomena, by a natural enough specialisation of functions, rain was usually left to God, rain with hail to his rival the devil. To obtain control over supernatural powers and lift the veil of the future has from the beginning been a dream dear to mankind, and everywhere has been believed to fall within the power of specially gifted men and women, often, as in the cases of the *evil eye* and *second-sight*, without any special desire for so peculiar a privilege. Certain natural objects and certain rites and observances had in themselves a mysterious power of producing certain effects, and the art of the sorcerer consisted in the knowledge of these mysterious powers and in the skill to combine and direct them to special purposes. Rhythmical incantations were effective in curing wounds and sickness, many to this day in Presbyterian Scotland preserving traces of Roman Catholic ritual; and magical properties adhered to enchanted stones, wands like the rod of Moses and the *caduceus* of Mercury, engraved gems, amulets, horseshoes, moles' feet, mystic numbers, especially Seven (q.v.), animals as the toad and corbie, plants as the elder, thorn, hazel, and rowan—the first and last especially as antidotes to sorcery. To the rhymes of healing there were corresponding maledictions, 'devilish prayers;' and baneful powders were made from the dismembered bodies of the dead or from herbs with naturally baneful properties. The witches' pot of Olaus Magnus is reproduced in the witches' caldron on the blasted heath in *Macbeth*, and indeed the brewing of poisonous hell-broth and dangerous love-philtres is a characteristic occupation of witches everywhere, and explains the old confusion between poisoning and witchcraft from the Latin *veneficium*.

The higher kind of European magic in the middle ages was mixed up with what physical science there then was; and the most noted men of the time, like Roger Bacon and Cornelius Agrippa, were addicted to the pursuit, or were at least reputed to be so. So far from deriving his power from the kingdom of darkness, the scientific magician by the mere force of his art could compel the occasional services of the arch-fiend himself, and make the inferior demons the involuntary slaves of his will. But this allowable magic occupied but a small place compared with the illegitimate prostitution of such powers to the ends of evil, and thus sorcery came naturally to mean the unholy art of employing the artillery of hell against defenceless man—the Black Art proper. Satan moreover required human agents for his damnable purposes, and thus the whole life of

man became a mere theatre whereon struggled countless hordes of devils, which to specially gifted eyes might sometimes be seen like a thick dust falling to the ground, or like motes in a sunbeam. Wier gives 72 princes and 7,405,925 inferior fiends, but as the astute Pierre de l'Ancre notes so precise a number could only have been communicated by Satan himself. The old heathen gods themselves came to be looked upon as devils with specialised functions—a theory we find imbedded in the demonology even of the *Paradise Lost*. St Augustine's treatise, *De Divinatione Dæmonum*, did much to formulate the orthodox opinion of Western Christianity on the subject, and in course of time the effects apparently produced by the intervention of the sorcerer were universally ascribed to the operations of the wicked angels who delighted to burlesque the divine methods and cause false dreams, visions, and prophetic inspirations, resembling in everything save their origin and their end those so often vouchsafed to the saints. Special personal compacts with the devil naturally came to be believed in, the individual, having the freedom of determining whether his own soul should be ultimately saved or lost, being able by a kind of *post-obit* bargain to purchase power and sensual gratification in this present world at the price of eternal damnation in the next. The literature of sorcery is full of such stories, from the 6th-century Theophilus (q.v.), saved through the special intervention of the Virgin, down to the awful fate of Dr Faustus which supplied a motive to two of the greatest modern masters of tragic art.

Apart from *obsession*, to which all men were liable, the actual fact of the *possession* of individuals, supported on such unexceptionable Scripture authority, was of course indisputable, and we find the power of casting out devils granted by Christ to his apostles continued in the church as a special grace. Pope Cornelius in the 3d century speaks of the Exorcists as a special order of the clergy, and the fourth Council of Carthage (396) prescribes a form for their ordination the same in substance as that given in the Roman *Pontifical* and used at the present day. There were six general symptoms of possession: barbarous and discordant screams, a fierce and horrid visage, numbness of the limbs, restlessness, unnatural strength, personal suffering—feeling the demons creeping like ants between the flesh and the skin, or like the pricking of needles. Speaking an untaught language was also held an infallible proof. The most effectual means of expulsion were holy water, consecrated wax, the *clangor campanarum*, and fumigation, which in *Tobit* is effectual in driving an obstinate Incubus from Ecbatana to Egypt. The exorcist first endeavours to fix the demon in the tongue, and during the process he applies rue or relics to the demoniac's nose, the while provoking the demon to come out by opprobrious epithets. Some go forth as bees or ants, with a loud noise and hissing, others are imprisoned in a ring or phial, or escape in the body of some animal. It is often necessary to hold down the demoniac under water lest the fiend take refuge in his hair.

But, as regards sorcery, witchcraft, and compacts with the devil generally, many individual theologians and a whole series of provincial councils had pronounced such beliefs to be heathenish, sinful, and heretical, and even in Gratian's Decretal there was a canon requiring the clergy to teach the people that witchcraft was a delusion, and as such incompatible with Christian faith. And indeed it was not till after the establishment of the Inquisition in the beginning of the 13th century that witchcraft came fully to be recognised as falling within the province of the church—regarded simply as a correlative with heresy, both the work of the agencies of hell employed to pervert the faithful from the truth, and therefore to be punished with torture and the stake. The wide-spread social misery of the 11th and 12th centuries, the alarming spread of Catharist and Waldensian heresies, the terror of the Black Death which devastated the whole of western Europe in the 14th century, and its startling concomitants, the Flagellant and Dancing manias, had all contributed naturally to prepare men's minds for a conviction of the reality of Satanic agencies operating with fresh virulence in the world, and terror induced persecution, while in its turn persecution propagated terror. The general theories on the subject were early formulated by the Inquisitors, to whose leading questions alone may be attributed the substantial identity in the confessions made by thousands of poor distracted creatures racked by the agonies of torture, and the awful terrors of the stake and an eternity of hell. The stern injunction in the Mosaic law (Exodus, xxii. 18) was claimed as proof of the fact of witchcraft, and the obscure passage 'because of the angels' (1 Cor. xi. 10), together with that in Gen. vi. 2, was taken to establish the reality of the *Incubus*, a form of demon addicted to unclean commerce with women. Such inversions of nature as monachism and clerical celibacy generated all manner of notions as to the inherent pravity of women, in whom a morbid monkish imagination saw the favourite agents of the devil. And such a phantasy as Gautier's *Morte Amoureuse* may well have visited the imagination of many a virtuous monk as the revenge of nature against the struggle to attain a fictitious virtue. Demoniality or carnal connection with demons was a besetting snare to mediæval nuns, and Sprenger ascribes to nothing else the great 15th-century development of witchcraft. Aquinas is very strong upon the point; and were not the Huns known to be sprung from such connections?

Incubi and Succubi infested nuns and monks in turn, and sometimes had the devilish malice to assume the form of a holy man or woman and allow themselves to be caught in a compromising situation. To gratify lust, to obtain power to forecast the future, to gain wealth, to gratify enmity were the chief ends of all witchcraft, and the last embraced every form of evil which wicked ingenuity could devise. None of the devices of witchcraft was more persistent or distressing than the magic 'ligatures' which prevented the consummation of marriage. A belief in the reality of this was maintained by many provincial councils or synods and hundreds of bishops, and we are told how the father of Guibert de Nogent suffered the impediment for seven years, during which his wife magnanimously refused to avail herself of this pretext for a divorce. Nor against the dread of witchcraft was there any remedy; exorcism and the invocation of saints could avail only in demoniacal possession—for witchcraft the only cure was to get surcease from the devil through the intercession of other witches. The difficulty of the contrast between the illimitable power for evil of the witch and her helpless inability to save herself was explained by the fact that through the goodness of God the power of the witch left her as soon as she was seized by the officers of justice. Moreover, that power could be broken by drawing her blood 'above the breath,' or by employing in precaution the vervain, the mountain-ash, and the like, or the horseshoe over one's doorway. Her own state of wretchedness while enjoying immense power for evil over others was due to the radical faithlessness of the devil. The details of the witches' Sabbath varied very little throughout Europe, being for the most part

a mere parody of the rites of divine service, eked out with filthy and unmeaning ceremonies. Music and dancing with lascivious orgies were its most characteristic features, and Sinclair (*Satan's Invisible World Discovered*, 1685) assures us that the devil often acted as piper, and taught many of those bawdy songs and their tunes unhappily so popular. Torture induced confessions which when made had to be adhered to, for Sprenger and most of the other inquisitors were strongly against pardon being granted even to a repentant witch. One of the especial tasks of the witch was the killing of unbaptised children, and many acted as midwives for no other purpose. The power of enduring torture was a special grace granted them by the devil, and other characteristic signs were crossing the legs, intertwining the fingers, women throwing their hair loose, walking backwards or contrary to the course of the sun (Scot. *widershins*), an inability to shed tears or repeat the Lord's Prayer, and especially the impression upon some part of the body of a secret mark imprinted by the devil at the Sabbath, when witches renounced their baptism and professed formally their submission. To discover this the prisoner was often shaved from head to foot, and subjected to horrible indecencies in the examination. This part was supposed to be insensible to pain, and one of the chief devices of the infamous 17th-century English witch-finder, Matthew Hopkins, was to prick the body of his victim all over until he found the spot. If his search was fruitless, he placed the witch cross-legged on a table in the middle of a closed room, with a hole in the door for the imps to enter by. In this manner she was kept for a day or even two days without sleep or food. Next she was walked up and down till her feet were blistered. By this time confessions enough were mostly forthcoming; but if all this had failed she was flung into a pond with thumbs and toes tied together cross-wise, when if a witch it was impossible for her to sink. The value of the watery ordeal depended upon the fact that Satan, being very light, supported those that were his own. Their extraordinary levity was again seen when they were weighed in the scales against the Bible. But these English tortures were gentleness itself compared with the infamies habitual to the Inquisition, and not unknown to Scottish Presbyterianism. And even in Scotland, though witches were occasionally burned *quick*, they were usually strangled before the fire reached them. They are supposed to have been fastened to the stake with those witch-bridles examples of which exist.

As we have seen, it was not till towards the close of the 13th century that the Inquisition succeeded in including sorcery within its jurisdiction. The university of Paris gave all the weight of its learning in 1398 to the reality of the fact, and already in 1330 Pope John XXII. had given a powerful impetus to the persecution; but it was not till 1484, when Innocent VIII. issued his infamous bull *Summis desiderantes affectibus*, that the reign of terror really began. The earliest detailed account of witchcraft is found in Nider's *Formicarius* (1337), in which we can trace the development out of ordinary sorcery. The *Flagellum Hæreticorum Fascinariorum* of the Inquisitor Nicholaus Jaquerius (1458) already shows the Holy Office realising the need of a regular procedure, and this was at last given with much fullness in the infamous *Malleus Maleficarum* (1489), the work of the sincere fanatic Sprenger and his coadjutor, Krämer (Institor), who, armed with Pope Innocent's bull, traversed Germany, leaving behind them a track of blood and fire. The infection spread far and wide, and witches were no longer burned in twos and threes, but in scores and hundreds. In the small bishopric of Bamberg within three months 600 perished; in Würzburg, which is scarcely larger, 900; in Geneva, 500 (1515); in the district of Como, Bart. de Spina (*De Strigibus*) says over a hundred were burned every year; at Toulouse 400 perished together, and 50 at Douay in a single year; Nicholaus Remigius, a judge of Lorraine, boasts in 1597 that he had condemned 900 in fifteen years; the Archbishop of Trèves avenged the coldness of the spring of 1586 upon 118 women and 2 men burned together. And his promptitude was well advised, for some of his victims on the way to their place of doom declared that with three more days they would have brought cold so intense as to destroy every green thing, and plunge the whole country into starvation. The Inquisition did its work effectively, for Paramo boasts that by 1404, within a century and a half of its foundation, it had burned at least 30,000 witches who, if left unchecked, could easily have brought the whole world to destruction. The charge of sorcery had been a prominent feature in the infamous trials of the Templars in France; the Maid of Orleans had been burned on this charge at Rouen in 1431 at the instance of the English, but by sentence of a French bishop; and these cases, with that of the Vaudois, or witches of Arras, of whom 34 were arrested and 12 burned (1460), were the most conspicuous examples of such processes before the identification between sorcery and heresy was complete, and the jurisdiction passed finally into the control of the Inquisition. The progress of the witchcraft epidemic had indeed not been rapid, and all three cases had aroused widespread public incredulity, while Joan's character was solemnly rehabilitated in 1456; and the Parlement finally in 1491 upset the Arras processes and sentences as unjust and excessive, ordered reparation to be made even to the dead in the shape of masses for their souls, and decreed that the cruel and unusual tortures employed should be prohibited for the future in all secular and ecclesiastical tribunals. Perhaps in consequence of all this the Inquisition made its way much slower in France than in Germany and Italy. But the most severe rebuff it experienced was from the republic of Venice, which had jealously preserved the secular jurisdiction over sorcery. Brescia had become specially infested by witches, and in 1510 as many as 70 men and 70 women were burned there; in 1514, 300 at Como; while it was currently reported that the Sabbath on the plain of Tonale near Brescia was attended by 25,000; and finally in 1518 the senate was informed that the inquisitor had burned 70 witches of the Valcamonica, that he had as many more in his prisons, and that those suspected or accused amounted to about 5000, or one-fourth of the population of the valleys. The Signoria at once interposed its veto, and even the fiery bull of Leo X., *Honestis* (1521), could not force its outraged sense into submission.

The Reformation of the 16th century made no change in the popular view of witchcraft, which, indeed, rather rose to a height during the 17th century. Theologians of all confessions believed in the possibility and reality of compacts with the devil as strongly as they believed in the dogma of the personality of the devil itself. Erasmus and Luther were equally strong believers in witchcraft, and the latter realised the active interference of the devil as few men have done in any age. Catholic and Protestant theologians alike defended the prosecutions; on the one side, Jean Bodin, Peter Binsfeld, and the Jesuit Martin Delrio; on the other, the Heidelberg physician Thomas Erastus, King James I. of England, and the

famous criminal lawyer Carpzov of Leipzig. But in spite of this array of learning, and the vast preponderance alike of clerical and lay opinion, there had not been wanting a succession of honest doubt, whether from natural scepticism or from humanity. Johann Wier (q.v.), a physician, by his famous work, *De Præstigiis Dæmonum* (1564), and its complements, *De Lamiis* and *Pseudo-monarchia Dæmonum* (appended as a sixth chapter to the 1577 edition), has left a name imperishable among the benefactors of humanity. His scepticism was not too strong, but he went as far as he durst, and evidently meant to imply more than he dared say. The reply of the famous political philosopher, Jean Bodin, *De Magorum Dæmonomania* (1579), is mainly an indignant and completely credulous appeal to authority—to universal law, the Scriptures, and the Fathers. The great work of the enlightened Englishman, Reginald Scot, *The Discoverie of Witchcraft*, followed in 1584, and stands alone, more than a century before its time, as a full and outspoken appeal to reason and to humanity against a puerile and cruel superstition. Montaigne in his essay 'Of Cripples' (1588), with regard to this question, strikes the fundamental note of modern rationalism, and adds with exquisite irony, 'after all, it is setting a high value on our conjectures to roast a man alive on account of them.'

Yet it was only very gradually that the superstition gave way. Nicholaus Remigius published his *Dæmonolatria* in 1595, the Jesuit Martin Delrio his erudite and ponderous *Disquisitiones Magicæ* in 1599. But two Jesuits may also be counted among the earliest enemies of the superstition, Adam Tanner (1572–1632) and Friedrich Spee, whose *Cautio Criminalis, seu de Processibus contra Sagas* (1631), was an appeal for more circumspection in the trials, the author having been present at many of these in the dioceses of Würzburg and Bamberg, and having come to the conclusion that many of the victims were entirely innocent. He advances no less than fifty-two doubts, and his conclusion is that there is so much difficulty in such cases that processes should be suspended. He dared not put his name to his work, and could print it only in a Protestant town, Rinteln. The Dutch Protestant Balthasar Bekker, in his curious work *De Betoverde Wereld* (1691–93), expresses openly a strong disbelief in sorcery, magic, possession by the devil, and even the existence of the devil himself. He was deposed and excommunicated for his temerity. The great Halle jurist, Christian Thomasius, published in 1701 a masterly tract, *Theses de Crimine Magiæ*, which did much to educate the public opinion of Germany. But the devil did not give way before the philosophers without a struggle. There was a great outburst of lycanthropy in the later half of the 16th century in southern France, the most interesting trial being that of Gilles Garnier at Dôle in 1573. The provincial Parlements of Paris, Rouen, Rheims, and Bordeaux enacted stringent decrees against all forms of witchcraft, and the cases of some of their victims give reason to suspect the real guilt of toxological practices, thus reviving the full signification of the ancient *venefícus*. The Parlement of Bordeaux appointed a commission to inquire into the causes of the prevalence of witchcraft in the Basque provinces, and these remain to the curious in the work of Pierre de l'Ancre, one of the most interesting of its class, *Tableau de l'Inconstance des Mauvais Anges et Démons* (1612). He found the whole population of the Labourd infected with witchcraft—the men, the women, and even the priests and children, as many as 2000 of the last alone flocking nightly to the Sabbath. He sees a singular affinity between tobacco and sorcery, and finds a special significance in the Basque fondness for the apple, the fruit of transgression; but the real reason why women are naturally so much more prone to sorcery than men he thinks most probably a secret wrapped up in the inscrutable wisdom of God. Another phase of witchcraft rife in France during the 17th century was demoniacal possession, and this reached its height in the strange convulsions of the Ursuline nuns of Sainte-Baume near Aix, and the abominable immoralities of their corrupter Louis Gauffridi, burned alive deservedly in 1611; in the famous case of Urban Grandier (burned 1634) and the nuns of Loudun in Poitou; and in the ecstatic trances of Madeleine Bavent and her guilty relations with her abandoned confessor at the convent of Louviers (1635–47). These unedifying histories of lust and cruelty may be read in the glowing pages of Michelet, *La Sorcière* (2d ed. 1862). In the same century the fires of persecution raged hotly in Bamberg and Würzburg, as many as 900 trials having taken place in the reign of the prince-bishop John George II., in the two courts of Bamberg and Zeil between 1625 and 1630, and 600 are supposed to have been burned, so little care being taken that the accused are not enumerated by name, but merely cited as No. 1, 2, 3, and so on. Under Bishop Philipp Adolf, who came to the see of Würzburg in 1623, a great confederacy of sorcerers was quickly discovered, and during two or three years hundreds of persons of all ages and conditions, children of ten and twelve years old, vicars, canons, students, together with 'Göbel's child, the most beautiful girl in Würzburg,' were hurried to the stake. The ghastly catalogue of these victims in twenty-nine burnings is printed in Hauber's *Bibliotheca Magica*, and reprinted in Thomas Wright's excellent *Narratives of Sorcery and Magic* (2 vols. 1851). A great epidemic of witchcraft broke out in the village of Mohra in Sweden in 1669, and a commission of clergy and laymen appointed by the king examined as many as 300 children, and found a singular unanimity in the confession of particulars. Seventy persons were condemned to death, 15 being children, while 36 more between nine and sixteen were forced 'to run the gantlet,' and 20 more were whipped every Sunday for a year. See the account by Anthony Horneck, D.D., appended to Glanvill's *Collection of Relations*.

In 1672 we find Colbert directing the magistrates in France to receive no accusations of sorcery and commuting sentences of death into banishment, an indulgence against which the Parlement of Rouen protested as dishonouring to God and Christian tradition. The most remarkable trial for sorcery at this period was that of the Marshal of Luxembourg in 1681, and we find in the last two decades of the century only seven sorcerers burned in France. Yet the Parlement of Bordeaux burned a man as a *nouveur d'aiguillettes* in 1718; and in spite of all the boasted illumination of the 18th century an old nun was burned as a witch at Würzburg in 1749. In the year 1754 a girl of thirteen, and in 1756 another of fourteen, were put to death at Landshut on suspicion of witchcraft. A servant-girl at Glarus in German Switzerland in 1782 was the latest judicial victim in Europe—the last of 300,000 women who are computed to have perished since the promulgation of the bull of Innocent VIII. Within the range of Catholicism, so late as 20th August 1877, five witches were burned alive by the Alcalde Ignacio Castello of San Jacobo in Mexico, 'with consent of the whole population.'

England was long preserved from the infection of regular persecutions for witchcraft, the first formal enactment declaring it a felony dating only from 1541. Besides, as we have seen in the Templar trials, torture was naturally repellent to the national spirit, and without systematic torture

and leading questions such prosecutions could not thrive. At the same time there had been ever since the Conquest occasional trials for sorcery, and victims had been burned by the king's writ *De Hæretico comburendo*, after condemnation in the ecclesiastical courts. The Act of 1541 was supplemented by another under Elizabeth in 1562, and in the first year of James I. was passed the law which continued in force for over a hundred years. Its most important section ran as follows: 'If any person or persons shall use, practise, or exercise any invocation or conjuration of any evil and wicked spirit, or shall consult, covenant with, entertain, employ, feed, or reward any evil and wicked spirit to or for any intent or purpose, or take up any dead man, woman, or child out of his, her, or their grave or any other place where the dead body resteth, or the skin, bone, or any part of any dead person, to be employed or used in any manner of witchcraft, sorcery, charm, or enchantment, or shall use, practise, or exercise any witchcraft, enchantment, charm, or sorcery, whereby any person shall be killed, destroyed, wasted, consumed, pined, or lamed in his or her body or any part thereof,' every such offender is a felon without benefit of clergy. We find in earlier days sorcery regarded with a kind of vague dread, heard of occasionally in such cases (in large part political) as those of Dame Alice Kyteler of Kilkenny, who saved herself only by flight in 1324, leaving her obscurer accomplices to perish; the Duchess of Gloucester, who did public penance and was imprisoned at Chester, while her secretary was hanged and her accomplice, the celebrated Witch of Eye, Margery Jourdemayne, burned (1441); and Jane Shore; but the wisdom of the Modern Solomon brought a knowledge of it down to everyday village life, and what had heretofore in England caused but occasional local mischief now became a virulent epidemic frenzy. In Cranmer's 'Articles of Visitation' (1549) an injunction is addressed to the clergy, that 'you shall inquire whether you know of any that use charms, sorcery, enchantments, witchcraft, soothsaying, or any like craft invented by the devil.' Strype tells us Bishop Jewell, preaching before the queen in 1558, said: 'It may please your Grace to understand that witches and sorcerers, within these last few years, are marvellously increased within your Grace's realm. Your Grace's subjects pine away even to the death, their colour fadeth, their flesh rotteth, their speech is benumbed, their senses are bereft. I pray God they never practise further than upon the subject.' Reginald Scot's protest fell unheeded, or rather roused the king to write his *Dæmonologie* (1597), which was ostensibly aimed against the 'damnable opinions of Wierus and Scot, the latter of whom is not ashamed in public print to deny there can be such a thing as witchcraft.' In Lancashire especially there was found to be a deplorable increase of witches; in 1612 fifteen were indicted at Lancaster and twelve condemned, and in 1634 seventeen Pendle Forest witches were condemned on the evidence of one boy, who was fortunately discovered to be an impostor. Under the Commonwealth there was a great increase of persecution, and especially in the Puritan eastern counties. The infamous 'Witch-finder General' Matthew Hopkins pricked, waked, and swam hundreds of unhappy women in Essex, Suffolk, Norfolk, and Huntingdonshire, carrying with him an assistant and a female searcher, and charging twenty shillings expenses in every town he visited. Hopkins caused to be hanged sixty in one year (1644) in Essex, and [Bishop] Hutchinson in his reliable *Essay on Witchcraft* (1718) enumerates sixteen executions at Yarmouth in 1644, fifteen in Essex in 1645, nearly forty at Bury St Edmunds in 1645–46—among these last 'an old reading parson,' John Lowes, who had been for nearly fifty years vicar of Brandeston in Suffolk, and who under torture confessed to having employed two imps to sink a ship. Baxter in his *Certainty of the Worlds of Spirits* (1691) tells with approval this pitiful story, and elsewhere we are told how the old man read the burial-service for himself just before his execution. John Gaule, vicar of Great Staughton, published his *Select Cases of Conscience touching Witches and Witchcraft* (1646), attacking the methods of Hopkins, and it is a satisfaction to find that there is every probability Hopkins was himself swum and hanged in 1647. One of the most striking cases occurred in 1664, when the enlightened Sir Matthew Hale tried and condemned two women, Amy Duny and Rose Cullender, at Bury St Edmunds, for bewitching children, the opinion of Sir Thomas Browne, who was present, telling with great weight against the prisoners. Chief-justices North and Holt were the first in high places who had the good sense and the courage to set their faces against the continuance of this delusion, and to expose the general absurdity of such charges. The last trial in England was that of Jane Wenham, convicted at Hereford in 1712, but not executed.

But popular beliefs die hard, and we find a poor paralysed Frenchman dying in consequence of being swum by a mob at Castle Hedingham in Essex in 1865, and again in 1879 at East Dereham in Norfolk a man fined for assaulting the daughter of an old woman who had charmed him by a 'walking toad.' And even in the *Daily News* of April 12, 1890, we read that at the inquest on the body of a child at Fressingfield in Suffolk the parents confidently ascribed its death to the witchcraft of its step-grandmother, who had died a few hours before it. The child was taken out in a perambulator from which the father saw smoke come forth, while the mother said the child when it was brought home was hot and dry and smelt of brimstone. But indeed the spiritualism and theosophy of the 19th century harmonise well with the exploded doctrine of witchcraft, and would have given much comfort to Bodin, Remigius, or Delrio. We have seen Sir Thomas Browne and Baxter's conviction of the reality of witchcraft, and we find Selden, with characteristic caution, recommending that witches should be hanged for their malignant intentions at any rate. Three books which deserve to be named in the roll of honour as outspoken appeals to humanity and sense are *A Candle in the Dark*, by Thomas Ady (1655), *The Question of Witchcraft Debated*, published anonymously by John Wagstaffe (1669), and *The Displaying of Supposed Witchcraft* (1677), by John Webster, a work of singular vigour and ability. Hobbes was sceptical on the matter, but the philosophical Glanvill in his famous *Sadducismus Triumphatus* (1681) made a bold attempt to buttress the already decaying belief, maintaining that Atheism grew out of Sadducism, and that witches once disproved, all spiritual existence disappeared with them. More and Cudworth approved the book, and even so late as 1768 John Wesley repeated the same argument: 'It is true likewise that the English in general, and indeed most of the men of learning in Europe, have given up all accounts of witches and apparitions as mere old wives' fables. I am sorry for it, and I willingly take this opportunity of entering my solemn protest against this violent compliment which so many that believe the Bible pay to those who do not believe it. I owe them no such service. I take knowledge that these are at the bottom of the outcry which has been raised, and with such

insolence spread through the land in direct opposition not only to the Bible, but to the suffrage of the wisest and best of men in all ages and nations. They well know (whether Christians know it or not) that the giving up witchcraft is in effect giving up the Bible.'

Nowhere were the witchcraft trials more cruel than in Scotland, where the clergy controlled the whole social life, and an iron theology dominated the imaginations of men; the more vividly the torments of hell are realised the more callous do men ever become to human sufferings in this world. We find the Scottish clergy throughout the leading managers of the prosecutions, before whom the confessions were taken and the tortures inflicted. The ministers and kirk sessions were required to make strict inquisition, and private accusations were invited even from the pulpit. There is but little account of sorcery in the earliest Scottish records, scarce anything in Fordun, but enough in Wyntoun, and ample store also in the *Breviary of Aberdeen* (1510). The statute of 1563 was the first regular enactment, and the earliest conviction is supposed to have been that in 1479 for consuming a waxen image of the king. Yet comparatively early we find it occasionally ascribed to persons of high estate. Sir Michael Scott of Balwearie, and William, Lord Soulis of Hermitage Castle, who was boiled to death, were notable sorcerers; Janet Douglas, Lady Glammis, was executed under James V. (1537) for devising the death of the king by poison or witchcraft; John Knox mentions the Countess of Huntly as a notable patroness of witches, and himself was supposed to have gained the affections of Lord Ochiltree's youthful daughter by sorcery; Catherine Ross, Lady Fowllis, only escaped with difficulty on a charge of sorcery in 1590; and the Earl of Gowrie of the mysterious conspiracy was a master of magic, the word *Tetragrammaton*, found written in parchment on his body, preventing the blood flowing even when he was dead. Some ten years earlier a vast hellish conspiracy was formed near Edinburgh to drown King James VI. on his voyage from Denmark. It centred round Doctor Fian, *alias* John Cunningham, master of the school at Saltpans in Lothian, and Agnes Sampson, the 'Wise Woman of Keith' (Haddingtonshire), whom Archbishop Spottiswoode describes as 'a woman not of the base and ignorant sort of witches, but matronlike, grave, and settled in her answers, which were all to some purpose.' Fian's nails were torn from his fingers, and his legs were crushed by the boot till the marrow was squeezed out of the bones, and finally, in January 1591, he ended his sufferings in the fire. The confessions of the woman told how as many as two hundred witches had flocked to the kirk of North Berwick, where the devil preached damnable blasphemies and denunciations of the king, and made all the witches kiss his bare buttocks over the pulpit. Dr W. Ramesey in his *Elminthologia* (1668) tells us he saw nine witches burning together on Leith Links in 1644, and about 1650 we hear of John Kincaid of Tranent, especially skilful as a pricker, using pins about three inches in length. We read in Pitcairn how Alesoun Balfour was burned at Kirkwall in 1596, after being tormented with the *caschielawis* for forty-eight hours, her aged husband before her eyes bound in the *lang irnis* of fifty stone weight, her son tortured with the *boot* to the extent of fifty-seven strokes, her daughter, but seven years old, put in the *pillie-winkis* (thumbscrews). The Restoration set the witch-fires ablaze with greater fury than ever, ignorant justices abetted by frenzied ministers sentencing all delated to them. As many as fifty commissions from the Privy-council to individuals of certain districts to hold trials, each with the names of from one to ten delinquents, were issued within eight months from January 1662, and these distinct from the ordinary Court of Justiciary, Sheriffs, and Bailies of Regalities. One of the most striking cases was that of Isobel Gowdie of Auldearn, burned in 1662 after a series of confessions of unusual imaginativeness, printed in full by the painstaking Pitcairn. This small district contained at that time so many witches that Satan, for convenience, was obliged to divide them into companies of thirteen, called *covines*. Major Weir was strangled and burned at Edinburgh in 1670 for sorcery and incest; his sister Jean, who confessed to intercourse with evil spirits, and employed a *familiar* to spin her lint, was hanged the day after. In 1662 there was a great outburst of witchcraft at Inverkip, Renfrewshire, where Marie Lamont, a girl of eighteen, made a series of remarkable confessions. In Renfrewshire also seven suffered in 1697 at Paisley for bewitching Christian Shaw, of Bargarran, a girl of eleven, who afterwards was the means of beginning the thread-manufacture in Paisley. Other more notable cases occurred also at Kinross (1718), Spott in East Lothian (1705), Pittenweem (1704); as well as the death through the use of a waxen figure of Sir George Maxwell of Pollock in 1677, for which five suffered at Paisley, and the obstinate bewitching of Lord Torphichen's son in 1720. The last execution in Scotland took place at Dornoch in 1722, where a poor old woman perished for having ridden her own daughter, transformed into a pony, and shod by the devil, which made the girl ever after lame, both in hands and feet, as well as her son after her. The weather was cold, and the old woman sat quietly warming herself by the fire prepared to burn her while the preparations were being made. Sir George Mackenzie (q.v.), who is not usually credited in Scotland with humanity, among other sensible and humane remarks on witchcraft, adds: 'Most of these poor creatures are tortured by their keepers, who, being persuaded they do God good service, think it their duty to vex and torment poor prisoners; and I know, *ex certissimâ scientiâ*, that most of all that ever were taken were tormented after this manner; and this usage was the ground of all their confession.' William Forbes, professor of law in Glasgow, declares his firm belief in witchcraft in his *Institutes of the Law of Scotland* (1730), defining it as 'that black art whereby strange and wonderful things are wrought by a power derived from the devil. . . . Nothing seems plainer to me than that there may be and have been witches, and that perhaps such are now actually existing; which I intend, God willing, to clear in a larger work concerning the criminal law.' The statutes against witchcraft were finally repealed in 1736, to the great displeasure of the leading seceders from the Church of Scotland, for we find enumerated, in the confession of national and personal sins printed in an act of the Associate Presbytery at Edinburgh in 1743, the act of Queen Anne's parliament tolerating Episcopacy in Scotland, the act for adjourning the Court of Session during the Christmas holidays, 'as also the penal statutes against witches having been repealed by parliament, contrary to the express law of God; for which a holy God may be provoked in a way of righteous judgment to leave those who are already ensnared to be hardened more and more; and to permit Satan to tempt and seduce others to the same dangerous and wicked snare.'

Those who crossed the Atlantic for conscience' sake carried all their superstitions with them, and we find an execution for witchcraft in New England as early as 1648, while in the abstract of the laws of that colony, printed in 1655, there stands these articles: 'Witchcraft, which is fellowship by cove-

nant with a familiar spirit, to be punished with death. . . . Consulters with witches not to be tolerated, but either to be cut off by death or banishment, or other suitable punishment.' But the interest of American witchcraft centres in the famous Salem cases (1691–92), the guilt of which may in great measure be laid on the shoulders of Cotton Mather (q.v.), author of *Memorable Providences relating to Witchcraft and Possessions* (1685) and *Wonders of the Invisible World* (1692). Nineteen persons were executed, among the six men one clergyman and Giles Corey, a man over eighty, who, refusing to plead, was pressed to death. All died protesting their innocence, and even those who had been terrified into confession withdrew it, although their honesty cost them their lives. Nor were the victims here at least abandoned by their friends: in all the trials of this kind there is nothing so pathetic, says Mr Lowell, as the picture of Jonathan Cary holding up the weary arms of his wife during her trial, and wiping away the sweat from her brow and the tears from her face. A reaction speedily set in, and, though in January 1693 three more were condemned, no more executions took place, and a few months after the governor discharged all the suspects from gaol, as many as 150 in number. One Samuel Parris, a clergyman who had been one of the main instigators of the prosecutions, confessed his error, but was dismissed by his flock in 1696, while even Cotton Mather acknowledged that there had been 'a going too far in that affair.' This lamentable story is told fully by Charles W. Upham in his *History of the Salem Delusion* (1831; new ed. 2 vols. 1867). See also Mr Lowell in vol. ii. of *Literary Essays* (1890).

Many of the more important books on witchcraft have been mentioned incidentally in the foregoing pages; the names of all the older books will be found in Grässe's *Bibliotheca Magica* (Leip. 1843). A comprehensive collection is that published at Frankfurt in 2 vols. 1582, containing the pertinent books of Sprenger, Nider, Basin, Molitor, the *Flagellum Dæmonum* compiled by Mengus, Gerson, Murner, Malleolus, and Bart. de Spina. Another is the *Theatrum de Veneficiis* (Frankfurt, 1586), containing seventeen tracts by Danæus, Lercheimer, Bullinger, Ewich, Trithemius, &c. Among general books the best accounts of the superstition will be found in Lecky's *History of Rationalism in Europe* (vol. i.), Tylor's *Primitive Culture*, and H. C. Lea's invaluable *History of the Inquisition of the Middle Ages* (vol. iii. 1887). Serviceable books are Thomas Wright's *Narratives of Sorcery and Magic* (2 vols. 1852); Ennemoser's *Geschichte der Magie* (Eng. trans. 1854); Maury, *La Magie et l'Astrologie* (1860); Garinet, *Histoire de la Magie en France* (1818); Heppe's edition of Soldan's *Geschichte der Hexenprocesse* (2 vols. 1880); Scott's *Letters on Demonology and Witchcraft* (1830); Grimm's *Deutsche Mythologie;* Howard Williams, *The Superstitions of Witchcraft* (1865); Roskoff's *Geschichte des Teufels* (1869); Conway's *Demonology and Devil Lore* (2 vols. 1878); Diefenbach, *Die Hexenwahn* (Mainz, 1886); W. H. Davenport Adams, *Witch, Warlock, and Magician* (1889); *Le Sabbat des Sorciers* (1882) and other vols. in the 'Bibliothèque Diabolique;' J. Baissac, *Les Grands Jours de la Sorcellerie* (1890); and C. G. Leland, *Gypsy Sorcery* (1891). An indispensable book for Scotch witchcraft is Pitcairn's *Criminal Trials in Scotland from 1484 to 1624* (4 vols. 1830–33), which may be supplemented by Wodrow's *Analecta*, and especially J. G. Dalyell's *Darker Superstitions of Scotland* (1834), J. H. Burton's *Criminal Trials in Scotland* (2 vols. 1852), and C. K. Sharpe's edition of Law's *Memorialls* (1819), with introduction, itself reprinted as *The History of Witchcraft in Scotland* (1884). See also such folklore books as are really reliable, as those of Pitré, Krauss, Ralston, Mannhardt, &c.; and the articles Animism, Apparitions, Astrology, Demonology, Devil, Divination, Evil Eye, Exorcism, Fairies, Familiar, Faust, Incantations, Magic, Spiritualism, Vampire, Werewolf.

Witch-hazel (*Hamamelis virginica*), a North American shrub of the natural order Hamamelidaceæ. This order contains only a very small number of species, much diffused over the world, but none of them European; shrubs or small trees, with alternate, stipulate, feather-veined leaves, and small axillary unisexual flowers. The witch-hazel is a shrub or small tree 10 or 12 feet high. The leaves are 4 inches long and 2 or 3 broad; the flowers clustered, yellow and showy, with long linear petals appearing in the fall of the year, the fruit ripening in spring. The seeds contain a quantity of oil, and are wholesome and edible, while the leaves and bark are astringent, and the tincture is much used for piles, varicose veins, &c. The name is due to the supposed virtues of a forked twig as a divining-rod.

Witenagemót ('the meeting of counsellors,' *witena* being genitive plu. of the A.S. *wita*, 'a wise man,' 'a counsellor'), the great national council of England in Anglo-Saxon times, by which the king was supposed to be guided in all his main acts of government. Each kingdom had its own witenagemót before the union of the several kingdoms in 827, after which there was one for the whole country. It was composed of the bishops, the ealdormen of shires, and a number of the king's friends and dependents, the king's thanes (see Thane). It met frequently, if not at regular intervals, and claimed very extensive powers—which, however, varied inversely with the power of the prince. The witan deliberated in all new laws, made treaties, elected the king, and once deposed one (Ethelred II.), appointed bishops, assented to grants of land, with the king levied taxes, and formed a supreme court of justice. But, as it was a council of royal officers and territorial magnates, it is misleading to identify its functions with its successor, the representative House of Commons. See England and Parliament, and works there cited, especially Stubbs and Freeman.

Wither, George, poet, was born at Bentworth, Hampshire, June 11, 1588. He was sent to Magdalen College, Oxford, but after two years was called away through family reverses of fortune. At eighteen, however, he found his way to London, and entered at Lincoln's Inn, where he made fast friendship with William Browne, then of the Inner Temple. For his *Abuses Stript and Whipt* (1613), a very abstract satire indeed, he found himself in the Marshalsea, and here, in spite of harsh imprisonment, he wrote his *Shepherds Hunting*, a sweet pastoral, the fourth eclogue of which contains his famous verses on the consoling power of poetry to the poet. It is supposed that his satire addressed to the king (1614), together with the Earl of Pembroke's intercession, procured his release. In 1618 appeared *The Motto*, a curious piece of self-confession extending to two thousand lines, yet, says Charles Lamb, 'we read it to the end without any feeling of distaste, almost without a consciousness that we have been listening all the while to a man praising himself. There are none of the cold particles in it, the hardness and self-ends which render vanity and egotism hateful.' His finest poem, *Fair Virtue, or the Mistress of Philarete* (1622), with the curious inequality of all his work, shows exquisite fancy and here and there pure inspiration. His *Hymns and Songs of the Church* (1623) were authorised by a patent from the king, to the strong displeasure of the Stationers' Company. Accordingly they brought him no profit, although thus ushered into the world and set to music by Orlando Gibbons. His *Psalms of David translated* followed in 1631, his *Emblems* in 1634, his *Hallelujah* in 1641.

By this time Wither had become a fiery Puritan, and in 1642 he sold his estate to raise a troop of horse for the parliament. He was taken prisoner, and is said to have owed his life to the intercession of Sir John Denham, who pleaded with much more

wit than truth that, 'so long as Wither lived, he [Denham] would not be accounted the worst poet in England.' Later Cromwell made him major-general in Surrey, and Master of the Statute Office. At the Restoration he was stripped of his places and property, and, on suspicion of having written the *Vox Vulgi*, a satire on the parliament of 1661, flung first into Newgate, then into the Tower. He was released in 1663, died May 2, 1667, and was buried in the church of the Savoy Hospital in the Strand.

In character Wither was sincere, resolute, no flatterer even of Cromwell, temperate, devout in all things—his pipe was a sweet solace in Newgate, and he saw God's mercy in wrapping up 'a blessing in a weed.' His books number almost a hundred, but almost all his really excellent verse belongs to the first ten years, collected in his *Juvenilia* (1622; enlarged 1626 and 1633; Spenser Soc., 1870–72). After his death his poetry fell into almost complete oblivion, but the praises of Southey, Sir Egerton Brydges, Hallam, and especially Charles Lamb have restored him to his true niche in the temple of fame, from which he cannot now be degraded. Pope in his *Dunciad* had grouped 'wretched Withers' among the dull of ancient days; Percy in his *Reliques* inserted one of his poems, but did not venture to give his name, and in his fourth edition (1794) describes him as 'not altogether devoid of genius.' Charles Lamb's essay on the poetical works of Wither was first printed in the collection of his own writings published in 1818. It grew out of a series of marginal notes made by him in an interleaved copy of Wither's *Philarete* and other poems, edited and printed by his old school-fellow John Matthew Gutch at his private press at Bristol. This volume was first lent to Lamb by Mr Gutch, next to Dr G. F. Nott, the editor of Surrey and Wyatt, and found its way once more into the hands of Lamb, who again criticised Nott's annotations with no less freedom than critical insight. The volume finally came into the possession of Mr Swinburne, who contributed a full account of it to the *Nineteenth Century* for January 1885.

As a religious poet Wither, in the words of Charles Lamb, reached a starry height far above Quarles, and his sweet fancy and exquisite tenderness irresistibly provoke his readers' love. His earlier poems gave him in later years pangs of unnecessary repentance. A hearty homeliness of manner, a straightforward spontaneity and honesty of speech, a resolute feeling of independence are the characteristic marks of all his work, and, as has been seen, he rises not seldom into the serene atmosphere of real poetry. But his flight is never steady or long sustained, and bathos is doubly damnable in heptasyllabic couplets. The bright little piece, 'Shall I, wasting in despair' (from *Fidelia*, 1615), is known to all English readers, but it is by no means his best poem.

The *Hymns and Songs of the Church* were edited by Edward Farr in 1856 (Spenser Soc., 1880–81), the *Hallelujah* in 1857 (Spenser Soc., 1878–79), and *Vox Vulgi* by the Rev. W. Dunn Macray (1880). *Philarete* was reprinted in vol. iv. of Professor Arber's 'English Garner,' *Fidelia* in vol. vi. Besides those already named, the Spenser Society has reprinted the 'Miscellaneous Works' (six collections, 1871–78), *Britain's Remembrancer* (1879–80), the *Psalms of David* (1880–82), the *Parallelogrammaton* (1881–82), and *Respublica Anglicana, or the Historie of the Parliament* (1882–83).

Witherspoon, John, theologian, was born in the parish of Yester in Scotland, 5th February 1722, studied at Edinburgh, was minister at Beith, at Paisley, and in 1768 was called to be president of the College of New Jersey, and pastor at Princeton. He was a representative of New Jersey to the Continental Congress, became quite blind in 1790, and died at Princeton, 15th November 1794. His works (3 vols. Phila. 1803; and 9 vols. Edin. 1815) include *Ecclesiastic Characteristics* (1753), against the Moderates; a work on the stage (1757); and two treatises which are still read, on *Justification* (1756) and on *Regeneration* (1764).

Witness. See Evidence, Oath.

Witney, a town of Oxfordshire, on the Windrush, 11 miles W. by N. of Oxford (14 by a branch-line, 1861). It has a three-arch bridge (1822), a fine cruciform 13th-century church (restored by Street in 1867 at a cost of over £4000), a staple or blanket hall (1721), a market-cross (1683), a town-hall (1863), a corn exchange (1862), and a county court-house (1859). Its blankets enjoy a great reputation; and glove-making is also carried on. Pop. (1851) 3099; (1891) 3110. See J. A. Giles's *History of Witney* (1852).

Witsius, Hermann, Dutch theologian, was born at Enkhuysen, February 12, 1636, studied at Gröningen, Leyden, and Utrecht, and served as pastor till 1675, when he was called to a chair at Franeker, in 1680 at Utrecht. In 1698 he was called to Leyden, and here he died, October 22, 1708. His great work is *De œconomia Fœderum Dei cum hominibus* (1685; Eng. trans. 3 vols. 1763)—an unsuccessful attempt to establish a middle way between the orthodox and the federalists.

Other writings translated are *Conciliatory Animadversions on the Controversies agitated in Britain under the Names of Antinomians and Neonomians* (Glasgow, 1807), *Dissertations on the Creed* (Edin. 1823), and on the *Lord's Prayer* (1839).

Witt, De. See De Witt.

Wittenberg, a town of Prussian Saxony, till 1873 a fortress of the third rank, on the Elbe (here 800 feet wide), 59 miles SW. of Berlin. It is interesting as having been the capital of the electorate of Upper Saxony, as the cradle of the Reformation, and as containing the graves of Luther and Melanchthon. The famous university (1502), where Luther was professor and Hamlet studied, is now removed, and since 1815 incorporated with that of Halle. In the *Stadt-Kirche* are two remarkable pictures by Cranach, in which Melanchthon is represented as administering the sacrament of baptism, and Luther as preaching to a congregation of which the two foremost figures are his wife and son. In the *Schloss-Kirche* (1499) are the tombs of Luther and Melanchthon, as well as those of Frederick the Wise (with a noble bronze statue by Vischer) and John the Steadfast, electors of Saxony. Luther nailed his theses to its wooden door, which, burned by the Austrian besiegers in 1760 during the Seven Years' War, was in 1858 replaced by one of bronze bearing the Latin text of those theses. The *Schloss-Kirche* was restored and reopened by the German emperor on 31st October 1892—the occasion of a great Luther celebration. The Augustinian monastery, with Luther's cell, was converted in 1817 into a theological seminary; and the house of the great Reformer, containing his chair, table, &c., and two portraits of him by Cranach, remains almost unaltered. The houses of Melanchthon and Cranach are also shown. In the market-place is Schadow's bronze statue of Luther (1822), not far from which is Drake's of Melanchthon (1865), and outside the Elster Gate an oak marks the spot where Luther burned the papal bull. The fortifications were repaired by Napoleon in 1813 and occupied by the French; but it was besieged by the Prussians, and stormed by them 13th January 1814. It became permanently Prussian with the rest of Prussian Saxony in 1815. Manufactures are carried on of woollen and linen goods, hosiery, leather, brandy, and beer. Pop. 13,856. See works by Meyner (1845) and Schild (1883).

Witu, a small territory on the east coast of Africa, in which a German trading company acquired rights in 1886, but, as in some respects dependent on Zanzibar, put under British protection as part of the Imperial British East Africa Company by the agreement in 1890 between Britain and Germany. It is now part of British East Africa.

Witwatersrandt. See JOHANNESBURG.

Woad (*Isătis*), a genus of plants of the natural order Cruciferæ, containing only a few species, mostly natives of the countries around the Mediterranean. Dyer's Woad (*I. tinctoria*) was formerly much cultivated both in England and Scotland for the sake of a blue dye obtained from its root-leaves. The use of this dye was practically superseded by indigo. Dyer's woad is a biennial plant, with oblong crenate root-leaves about a foot in length, on pretty long stalks; an upright, much branched leafy stem, about 3 feet high; small yellow flowers, and large seed-vessels, about half an inch long and 2 inches wide, hanging from slender stalks. The leaves when cut are reduced to a paste, which is kept in heaps for about fifteen days to ferment, and then formed into balls which are dried in the sun, and which have a rather agreeable smell, and are of a violet colour within. These balls are subjected to a further fermentation before being used by the dyer. When woad is now used, it is always in union with indigo, which improves the colour. Even by itself, however, it yields a good and very permanent blue. In 1896 woad was grown at only three places in England, all near Boston; the price, formerly £25 a ton, had sunk to £9. It is supposed that woad was *vitrum*, the dye with which Cæsar said almost all the Britons stained their bodies. See Arthur Young's *Agricultural Survey of Lincolnshire* (1799); and an article and letters in *Nature*, November 1896.

Dyer's Woad (*Isatis tinctoria*).

Woburn, a small market-town 13 miles SW. of Bedford, noted chiefly for Woburn Abbey, seat of the Dukes of Bedford, which stands in a park 12 miles in circumference. The Cistercian abbey, a daughter house of Fountains, was founded in 1145, and rapidly became powerful. It and its lands were granted in 1547 to John, Earl Russell, afterwards Duke of Bedford. Of the abbey nothing now remains; the mansion, built mainly in the 18th century, occupies four sides of a quadrangle, and contains a magnificent collection of portraits. Pop. 1300.

Woburn, a town of Massachusetts, 10 miles by rail NNW. of Boston, with manufactures of pianos, shoes, leather, &c. Pop. (1890) 13,499.

Woden. See ODIN.

Wodrow, ROBERT, church historian, was born at Glasgow in 1679. He entered the university there in 1691, and, after passing through the arts classes, studied theology under his father, who was professor of divinity, and had suffered for conscience' sake during the persecution. He discharged at the same time the duties of college librarian, till in 1703 he was licensed to preach, and appointed minister of the Renfrewshire parish of Eastwood. He married in 1708, and had sixteen children; refused calls to Glasgow (1717) and Stirling (1726); and died 21st March 1734. Wodrow's writings, which fill close on fifty volumes of MS., are faithful and laborious, if heavy and one-sided, compilations. One only of them was published in his lifetime—the *History of the Sufferings of the Church of Scotland from the Restoration to the Revolution* (2 vols. fol. 1721–22), which was dedicated to George I., 'the best and greatest of kings,' and earned him in 1725 a grant of 100 guineas. The others include *Lives of the Scottish Reformers and most eminent Ministers* (selections, 2 vols. Maitland Club, 1834–45), *Analecta; or a History of Remarkable Providences* (4 vols. Maitland Club, 1842–43), a selection from his *Correspondence* (3 vols. Wodrow Society, 1842–43), and *Biographical Collections relating to the North-east of Scotland* (New Spalding Club, 1890).

See the Memoir by Dr R. Burns prefixed to his edition of the History (4 vols. 1830), and others by the younger M'Crie and R. Lippe to the two last-named works.

Woffington, MARGARET, actress, was born daughter of a Dublin bricklayer, October 18, 1720. She grew up a girl of remarkable grace and beauty, and, still a child, became a pupil of Madame Violante, mistress of a rope-dancing booth. From seventeen to twenty she played on the Dublin stage all manner of parts, from Ophelia to Sir Harry Wildair, and on 6th November 1740 made her first appearance at Covent Garden as Sylvia in the *Recruiting Officer*. Her beauty and grace, her pretty singing and vivacious coquetry, and the exquisite art especially of her male characters carried all hearts by storm. Her one drawback was the harshness of her voice, yet this in no degree hindered the completeness of her triumph. Her character was far from irreproachable, and it is most probable that Garrick never thought seriously of marrying her. But she atoned for all her faults by an irresistible goodness of disposition, and by a charity that knew no bounds. Her sister Mary failed as an actress, but married Captain Cholmondeley, nephew to Horace Walpole, and survived till 1811. Peg Woffington was always singularly independent and something whimsical in her moods, but she kept the affection of the public till the tragic close of her career. On 3d May 1757 she broke down in playing Rosalind, and left the stage for ever. She died at Teddington, 28th March 1760, her last days given to charity, good works, and penitence. She left a noble monument to her memory in her almshouses at Teddington.

See the Lives by Augustin Daly (New York, 1888) and J. Fitzgerald Molloy (1884); also R. W. Lowe's edition of Dr Doran's *Annals of the English Stage* (3 vols. 1888). Charles Reade's *Peg Woffington* is a clever novel enough, but is hardly successful as a living realisation of a singularly bright and interesting personality.

Wöhler, FRIEDRICH. See CHEMISTRY, p. 147.

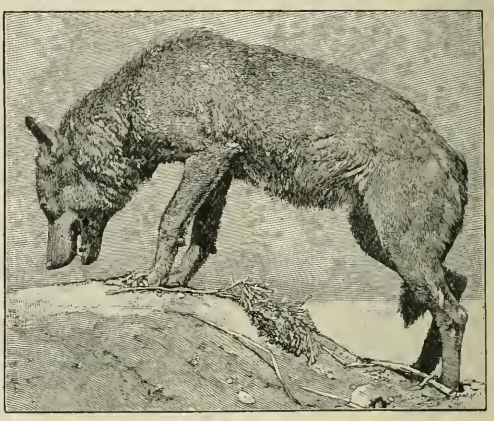
Woiwode, or VOIVODE (Polish *wojewoda*, Servian *vojvoda*, Russian *voevoda*), a Slavic word for the leader of an army; later used for an administrative ruler of a province, or, as formerly in Moldavia and Wallachia, the reigning prince.

Woking, a market-town of Surrey, 24 miles SW. of London by rail, with an old church (Early English and Decorated; restored 1878). Nearly 3 miles west is the 'London Necropolis Cemetery' (1864), 2000 acres in extent, to which funeral trains come regularly from London. Near was built the first public crematory in England (1878). Four miles NW. of Woking is Bisley Common, since 1890 the shooting headquarters of volunteers, removed from Wimbledon. Pop. of parish, 9000.

Wokingham, or OAKINGHAM, a market-town of Berkshire (till 1832 Wiltshire, detached), in Windsor Forest, 7 miles SE. of Reading by rail. Incorporated as a municipal borough in 1885, it has a Gothic town-hall (1860), neighbouring paper, saw, and flour mills, and the 'Rose' inn, where, once detained by wet weather, Gay, Swift, Pope, and Arbuthnot celebrated the host's pretty daughter in the ballad of 'Molly Mog.' It was famous for its bull-baitings till 1821. Bearwood, 1 mile W., is the seat of J. Walter, Esq., of the *Times*. Pop. (1851) 2272; (1891) 2060.

Wolcot, DR JOHN, better known under the pseudonym of 'Peter Pindar,' was born at Dodbrooke, near Kingsbridge, Devonshire, in May 1738. He was educated at Kingsbridge, at Bodmin, and in Normandy at the charge of an uncle, a surgeon of the little Cornish seaport of Fowey; and then, having studied medicine for seven years under him, walked the London hospitals, and taken his M.D. at Aberdeen (1767), he went to Jamaica as medical attendant to the governor, Sir William Trelawny. He made Wolcot physician-general of the island, and, to be able also to give him a good living, sent him home to England to procure ordination from the Bishop of London (1769). Three years later, however, he died, whereupon Wolcot forsook both Jamaica and the church, and started a practice at Truro. Here he discovered the talents of young Opie (q.v.), and with him in 1780 he removed to London, thenceforth to devote himself to writing audacious squibs and satires in verse on all sorts of persons, from George III. down to the city liverymen and even lower. His sixty or seventy poetical pamphlets (1778-1818) include *The Lousiad*, *The Apple-dumplings and a King*, *Whitbread's Brewery visited by their Majesties*, *Bozzy and Piozzi*, and *Lyrical Odes* on the Royal Academy exhibitions (Wolcot himself was no mean draughtsman). Witty and fluent, but coarse and ephemeral, they have long since outlived their vogue, which was great, for in 1795 he obtained from the booksellers an annuity of £250 for the copyrights. More than this, the ministry are said by Wolcot himself to have endeavoured vainly to bribe him into silence. Blind for some years, he died at Somers Town, 14th January 1819. See *Blackwood's Magazine* for July 1868.

Wolf, the vernacular name of certain species of the genus Canis; for a general account of which see DOG. The principal forms included in this section are as follows. (1) The Common Wolf (*C. lupus*) has very much the appearance of a large, long-legged, bare-boned dog, with a long tail, which hangs over its haunches instead of being curled upwards. Distinguishing characters are to be found in the lank body, length of the snout in proportion to the head, sloping forehead, oblique eyes, and erect ears. The fur varies according to the climate with respect both to its nature and colour. In the north it is long and thick—longest on the belly and legs, bushy on the tail, and erect on the neck and sides—whilst in the south it is generally shorter and rougher. The colour is usually pale yellowish gray mingled with black, lighter, often whitish gray below. It undergoes some change with the season, inclining to red in the summer, in the winter to yellow, which becomes white in the north; it is of a darker hue in the south. The forehead is whitish gray, the snout yellowish gray, always mingled with black, the lips whitish and the cheeks yellowish, sometimes indistinctly striped. A full-grown wolf measures 5 feet 5 inches in length, whereof 18 inches belong to the tail; its height is 33 inches, and its weight 50 kilos (over 100 lb.). The wolf's natural voice is a loud howl, but when confined with dogs it will learn to bark. Wolves inhabit a great variety of country, both hill and plain, especially thick forests and broken ground, with alternate morasses and dry patches, and in the south the steppes. They shelter in woods, marshes, canebrakes, and maize-fields, roaming over wide areas, often suddenly appearing where none have been seen for years, and as quickly vanishing—nor is this wonderful when it is remembered that they will cover from 25 to 40 miles in a single night.



The Common Wolf (*Canis lupus*).
(From a Photograph by Anschütz.)

In the neighbourhood of dwellings they only appear after twilight, but in secluded places carry on their hunting all day. Their food varies according to the season, consisting in summer almost exclusively of wild animals—foxes, hedgehogs, mice, birds, reptiles, and even vegetables; of larger animals, elk and deer, whilst hares are soon exterminated where wolves abound. They follow the herds of lemmings in their migrations, and will devour carrion with avidity; but they do not appear to attack man unless in large numbers or pressed by hunger. In winter they approach nearer to human habitations, doing much damage to flocks and poultry yards; they come into the outskirts of St Petersburg and Moscow, and even pass through the streets of such towns as Agram. When in packs they will attack horses and horned cattle. In the chase the wolf exhibits all the cunning of the fox, and in addition courage and the capability of hunting in packs. These will even divide into parties, one following the trail of the quarry, the other endeavouring to intercept its retreat. In mental qualities the wolf is in every respect the equal of the fox; his caution is so great that he regards every unfamiliar object with suspicion, will not pass through a door if he can leap over the wall, and will not, unless famished, attack a tethered animal lest it should be the bait of a trap. When he sees himself captured his courage and ferocity at once forsake him, so that we may readily credit Conrad Gesner's story of an old woman, a wolf, and a fox falling successively into a pitfall, and each keeping aloof from the others. The loss in life and property caused by wolves is in many places considerable; in Russia, where their number is estimated at 170,000, 203 persons were recorded in 1889 as having fallen victims to them, whilst the annual damage done to live-stock has been variously stated at from 7 to 15 million roubles (say from £700,000 to £1,500,000), and to useful wild animals at no less than 50 million roubles. In Lapland the word for peace is synonymous with security from wolves.

Hence it is not wonderful that these animals are universally detested, and that the chase for them is vigorously pursued, 10 roubles being paid for each one killed in Russia. In France, where they are found chiefly in the central and south-western departments, £4 is paid for the destruction of a full-grown animal, and £1, 12s. for a cub; and in 1883 as many as 1316 were killed; in 1889, 515; in 1890, 461; and in 1891, 404 (149 full-grown, 255 cubs; premiums paid, £1013—including extra sums for females big with young).

In spring and summer wolves are solitary or in pairs, in the autumn in families, and in winter in packs. The pairing season is in December and January, when the males fight savagely together; those who are fortunate enough to secure a mate remain with her till the young are well grown. The period of gestation is sixty-three days, and from three to nine (usually four to six) cubs are found in a litter; these are blind for twenty-one days, and are suckled for two months, but at the end of one month are able to eat half-digested flesh, disgorged for them by the mother. They quit the parents in November or December, but many remain together six or eight months longer; they are full grown in three years, and live from twelve to fifteen years. The stories of children having been brought up by wolves (Sleeman's *Journey through Oudh*, 1858, gives several such) require further confirmation. Wolves can readily be tamed when taken young, and then exhibit all the characteristics of domestic dogs. F. Cuvier tells of one presented by its master to the Jardin des Plantes, which recognised him with every manifestation of joy after intervals of one and a half and three years.

Notwithstanding the spread of civilisation, the wolf is still widely distributed. Excluding thickly populated regions, it extends over almost the whole of Europe; it is not unfrequent in Spain, Greece, and Italy, as well as France. So recently as 1885–86 no less than thirty-nine were killed in Alsace-Lorraine and two in the Rhine Provinces. It is rarer in Switzerland, and in mid and north Germany has been exterminated, as in Britain. Eastern Europe, Russia, and Scandinavia are the only parts where it now occurs in any large numbers. It never seems to have existed in Iceland, or in the islands of the Mediterranean. In Asia it is spread over all the centre and north-east, over Afghanistan and Beluchistan to Sind, and possibly over the higher Punjab. The distribution of the North American variety will be given below. In Britain it appears from geological evidence that the wolf must have existed in almost every county. Hunting it was a favourite pastime among the ancient Britons and Anglo-Saxons. In the reign of Athelstan one Acehorn built a refuge for wayfarers near Filey in Yorkshire; and the tribute of 300 wolf-skins annually levied by Edgar on the Welsh is a matter of common repute, though it did not cause the extermination of these animals, as is sometimes stated, for we find that Henry III. granted lands on condition of the wolves being destroyed. Three shillings were paid for three wolves killed near Lichfield in 1334; Nottinghamshire was infested as late as the eleventh year of Henry VI.; but no mention of them in England occurs after the reign of Henry VII. (1485–1509). In Scotland we have the well-known story of Sir Ewen Cameron of Lochiel killing the last in the country in 1680; but there is reason to believe that individuals existed in Sutherlandshire, as also on the Findhorn River till 1743. In Ireland we have a proclamation forbidding the export of wolf-dogs in 1652, and the ultimate disappearance of wolves has been placed about 1766.

The following forms, which appear to be varieties of the common wolf, have been at different times described as distinct species: (*a*) *C. niger* is based on two specimens, formerly in the possession of the Zoological Society, obtained by Lieutenants Kinloch and Biddulph in Tibet in 1887. Their distinctive marks are said to be shaggy fur, which is black, except for a white muzzle, feet, and patch on the breast. (*b*) *C. chanco* (probably = *C. laniger*, Hodgson) is a pale variety from Chinese Tartary. Hodgson says it is common in Tibet. (*c*) *C. pallipes* is said to be smaller and slighter than the typical form, with little or no under-fur; but undoubted examples of *C. lupus* differ as much from each other as this does from them. It inhabits the plains south of the Himalayas, but is rare west of the Indus. It does not hunt in large packs, but in numbers of six or eight at most. The superstition of the people prevents its destruction, for they imagine that its blood will diminish the fertility of the fields. It is seldom heard, not howling like the European wolf. It is remarkable even among wolves for speed and endurance. (*d*) *C. occidentalis* (the American Wolf) is less red and blacker on the back, though not to so great an extent as many Spanish wolves. Formerly it was very numerous in the plains, hanging on to the herds of bison, killing weaklings and calves. Sometimes it is very ferocious, even attacking man, but nevertheless has been known to satisfy its hunger with berries. It inhabits burrows with several openings. As late as 1870 it was found in Massachusetts, but at the present day it is found east of the Mississippi and south of Canada only in unsettled parts of south New England, New York state, the Alleghanies, and the south of Florida, and possibly the south of Ohio; it is abundant only in remote districts of Maine. North of this it is still quite common, extending as far as Greenland. Its southern limit seems to be the province of Guanajuato in Mexico. (*e*) *C. hodophylax* (the 'Jamaina' of the Japanese) inhabits the woody and mountainous parts of Japan, where it hunts in small packs or families, and is much dreaded by the natives. It is of small size, and has short legs and an elongated muzzle. (*f*) *C. lycaon* is a name which has been given to the European black variety.

The following may be regarded as distinct species: (2) *C. simensis* (Abyssinian Wolf), described by Rüppell from specimens captured in the mountains of Semyen (Simen), is as large as a big sheep-dog, and has a very long muzzle. It is of a pale reddish brown, lighter below; white round the mouth and eyes, the margins of the ears, chest, and forepaws; the end and upper part of the tail are black. It does not appear ever to attack man.

(3) *C. antarcticus* (the Antarctic Wolf) is an inhabitant of the Falkland Islands, and much alarmed the early explorers by its bold approach, which was, however, merely the confidence due to unfamiliarity. Darwin tells us that at the time of the visit of the *Beagle* they would steal meat from under the head of a sleeping man, whilst the gauchos would kill them by holding out a piece of meat in one hand and a knife in the other. They feed on the native geese, and burrow like foxes. They are solitary, and are silent except in the breeding season. The fur is moderately long, of a yellow colour speckled with black, paler below; the lips, chin, and throat are white, but the most characteristic mark is a black patch just above the heel.

(4) *C. jubatus* (Maned Wolf) is the largest of its family in South America. It occurs in Paraguay and adjoining regions, and is easily distinguished by its long limbs and large ears. It has longish hair of a bright yellowish red, and a stripe of black down the middle of the neck, which, however,

scarcely deserves the name of 'mane.' There is a black patch below the jaw and on each foreleg; the front of the throat and end of the tail are white. It inhabits low moist localities, and is said not to be dangerous to man or to domestic animals, except perhaps sheep. Its local name is 'A-gua-a,' perhaps from its cry.

(5) *C. latrans* (Prairie Wolf or Coyote) has now been extirpated over large tracts in Kansas, Nebraska, &c., but it may still be found where the common wolf has disappeared, owing to its smaller size and less dangerous character. It extends as far as 55° N. lat. and southwards to Costa Rica, and is abundant in northern Mexico, New Mexico, and Texas. Its colour varies with the season, being a bright tawny brown in summer and grayish or quite gray in winter. It has black stripes along the back and across the shoulders and hips; it is dingy white below, and tawny above the muzzle and outside the ears and legs. It is really a slender animal, but looks stout by reason of its thick coat. It causes much annoyance by its howling in the night, two or three producing the effect of ten by their numerous notes and their uninterruptedly succeeding each other. It eats all kinds of animal substances, and is the scavenger of hunting and travelling parties. In autumn it devours the prickly pear fruit, and in winter cranberries. Its cunning is so great that it is difficult to trap, and hence is killed by poisoning a bait, made more attractive by asafœtida. It will not attack man unless wounded. It breeds in retreats among the rocks, five or six, rarely ten, young being born in May or June.

C. lupus has been found fossil in Pleistocene deposits in various parts of Europe. An allied extinct form is *C. cautleyi* of the Indian Pliocene, probably the ancestor of *C. pallipes*. *C. nescherensis*, from the Upper Pliocene of France, is a smaller form; and *Lycorus*, from the French Pleistocene, is evidently a wolf, though it has only three premolar teeth.

For further information, see FURS; Mivart, *Dogs, Jackals, Wolves, and Foxes* (1890), with admirable coloured figures; Huxley, 'On the Cranial and Dental Characters of the Canidæ,' in *Proc. Zool. Soc.* (1880): Harting, *British Animals extinct within Historic Times* (1880). For a discussion of the rearing of children by wolves, see V. Ball's *Jungle Life in India* (1879).

Wolf, FERDINAND, a great Romance scholar, was born at Vienna, December 8, 1796, studied philosophy and jurisprudence at Gratz, then accepted a post in the royal library at Vienna. He took an active part in the foundation of the Academy of Sciences, and died February 18, 1866. Among his books were *Floresta de rimas modernas Castellanas* (2 vols. 1837), *Ueber die Lais, Sequenzen und Leiche* (1841), *Studien zur Geschichte der Spanischen und Portugiesischen Nationallitteratur* (1859), and *Histoire de la Littérature Brésilienne* (1863). Together with C. Hofmann he edited a collection of the oldest Spanish romances, *Primavera y flor de Romances* (2 vols. 1856). Besides he made numerous contributions of the greatest value on questions of Romance scholarship to the Vienna *Jahrbücher der Litteratur*, most of which were also dispersed as off-prints. He also contributed notes to the German translation of Ticknor's *History of Spanish Literature*, and left a supplement to it which was edited by his son (1867), who also printed a selection from his father's learned correspondence.

Wolf, FRIEDRICH AUGUST, the most gifted classical scholar and first critic of his age, was born at Hainrode near Nordhausen, 15th February 1759, son of the village schoolmaster and organist. His father removing to Nordhausen, he was sent to the gymnasium there, but his real education he gave himself with a zeal almost unparalleled in the annals of human learning. While still a schoolboy, besides a wide range in classical reading, he had mastered French, Italian, Spanish, Hebrew, and English, and perfected himself in the theory and practice of music. In April 1777 he went to the university of Göttingen, and inscribed himself in the matriculation-book as 'student of philology,' the first instance at any university. 'The matriculation was an epoch in German education,' says Mark Pattison. He attended the lectures very irregularly, being already much given to private study. For the rest he led a very retired life, was little visited or known, and was intimate only with a few. From Heyne, who once excluded him from his lectures on Pindar for his former irregularity, he kept himself quite aloof. That overpraised scholar coldly returned him the dissertation he laid before him in 1779, containing some novel views regarding the Homeric poems. The same year Wolf went as teacher to the Pædagogium at Ilfeld, and there first established his fame by an edition of the *Symposium* of Plato, with notes and introduction in German. In 1782 he was appointed to the rectorship of the High School at Osterode, in the Harz; and in 1783 he accepted an invitation to Halle as professor of Philology and Pädagogik. Here he spent twenty-three delightful years, giving a new meaning to philology, which he defined as 'knowledge of human nature as exhibited in antiquity.' As a science of interpretation it embraces literature, art, and, indeed, anything distinctly characteristic in the life of antiquity. At first he rather estranged than attracted students by the high tone of his teaching. However he learned to adapt himself to his audience, and was soon surrounded by a crowd of eager pupils. In his famous *Seminarium* he lavished all the stores of his mind upon his pupils, giving them also a brotherly sympathy and comradeship that aroused their enthusiasm. Three of his pupils were especially dear to him, Heindorf, Immanuel Bekker, and August Böckh. Before all things a teacher, literary labours and fame he looked upon more as a subordinate object, and all his writings were written merely on the spur of occasion and necessity. Yet he established his reputation as a scholar and critic by an edition of Demosthenes' *Oratio adversus Leptinem* (1789), and still more by his celebrated *Prolegomena ad Homerum* (1795), in which he unfolded, with equal erudition and acuteness, his bold theory that the *Odyssey* and *Iliad* are composed of numerous ballads by different minstrels, strung together in a kind of unity by subsequent editors. He maintains (1) that the Homeric poems were composed without the aid of writing, which was impossible for literary purposes about 950 B.C.; that they were handed down by oral recitation, suffering many changes in the process; (2) that the poems suffered many more changes after they were written down (*c.* 550 B.C.), made by revisers (διασκευασταί) or by learned critics with critical theories of their own; (3) that there is an artistic unity in the *Iliad*, still more in the *Odyssey*, but this is not due to the original poems, but the effect of the later redactions; (4) that the original poems, from which they have been put together, were not all by the same author. Yet he does not deny a personal Homer, but believes him a sovereign genius who 'began the weaving of the web.' This work made a great sensation through the whole of Europe. Some scholars gave out that they had long entertained similar notions regarding the Homeric poems; and Heyne insinuated that the Prolegomena were only a reproduction of what Wolf had heard at Göttingen. This gave rise to the spirited *Briefe an Heyne* (1797), of which the first three

especially are models of scholarly polemic and fine irony. In 1801 Wolf confirmed by an exhaustive inquiry the suspicions, first broached by Markland in England, of the genuineness of the four orations of Cicero: *Post reditum in Senatu, Ad Quirites post reditum, Pro domo sua ad pontifices, De haruspicum responsis.* He next demolished the authenticity of the oration *Pro Marcello* (1802), which had long been studied by the Ciceronians as a model of eloquence and style. He refused a call in 1796 to Leyden, in 1798 to Copenhagen, and in 1805 to Munich, but after the disasters of 1806 the university at Halle was dispersed, and Wolf was for a time reduced to great straits. He soon, however, became member of the Academy of Sciences at Berlin, where he took an active part in the reorganisation of the university, and was appointed a professor. He also received a post in the department for public instruction; but his administrative work proved a complete failure from his absoluteness and lack of tact, and, still worse, even in the lecture-room he seemed to have lost all the attractiveness and fire of his Halle days. He quarrelled with everybody—with Buttmann, even with Heindorf; Schleiermacher nicknamed him the 'distinguished Eremite.' His health began also to give way, and he took a journey to the south of France in April 1824, and died at Marseilles, 8th August 1824.

While in Berlin he edited along with Buttmann the *Museum der Alterthumswissenschaften* (1807–10), and afterwards the *Litterarische Analecten* (1817–20), perhaps the best philological journal that has ever been published. From the papers which he left his son-in-law, Körte, published *Ideen über Erziehung, Schule und Universität* (1835). Wolf never completed the greater part of his literary projects, and even his published writings remained splendid torsos. The *Darstellung der Alterthumswissenschaft* (1807) is his most finished work. His *Kleine Schriften* were edited by G. Bernhardy in 1869. See Hanhart, *Erinnerungen an Fr. Aug. Wolf* (1825); Körte, *Leben und Studien Fr. Aug. Wolf's des Philologen* (2 vols. 1833); Arnoldt, *F. A. Wolf in seinem Verhältniss zum Schulwesen* (2 vols. 1861–62); and Mark Pattison's *Essays* (vol. i. 1889)—the best account of Wolf in English.

Wolf, or WOLFF, JOHANN CHRISTIAN VON, philosopher and mathematician, was born a poor tanner's son at Breslau, 24th January 1679. At Jena he studied theology, but much more mathematics and philosophy, especially the writings of Descartes and Tschirnhausen. His annotations to the *Medicina mentis* of the latter brought him into connection with Leibnitz. In 1703 he began to give lectures at Leipzig in mathematics and philosophy, and when the incursion of Charles XII. into Saxony drove him from Leipzig he was called to Halle, on the recommendation of Leibnitz, to the chair of Mathematics and Natural Philosophy. His system of metaphysical and moral philosophy, worked out according to strict mathematical method, quickly spread through Germany, but Wolf was violently attacked by his pietistic colleagues in Halle, declared to be a despiser of religion, and a teacher of error, and formally accused to the government. The immediate ground of the accusation was an oration 'On the moral philosophy of the Chinese,' in which he spoke with approval of the morality of Confucius; but moreover the basest insinuations were brought against him as an advocate of anarchy. The Prussian king, Frederick-William I., was prejudiced against him by an argument that appealed to him. 'What does this pre-established harmony mean?' asked the king in his tobacco-parliament. 'It means,' was the reply, 'that if your tallest grenadier runs away, he can, properly speaking, not be justly punished, because his running away is, indeed, merely a piece of the pre-established harmony.' By a cabinet decree of November 15, 1723, Wolf was ordered on pain of death to quit Halle in twenty-four hours, and the Prussian dominions in two days; he was warmly received in Cassel, and appointed to a chair in Marburg. The dispute about his philosophical system now became general, and all Germany took part either for or against him, the victory ever inclining more and more to Wolf. Frederick the Great recalled him on his accession (1740) to be professor of the Law of Nature and Nations, and in 1743 he became chancellor of the university, and was raised to the rank of Baron of the Empire by the Elector of Bavaria during the regency. He died at Halle, April 5, 1754. Before his death he saw his philosophy spread over the whole of Germany and a great part of Europe; but he had outlived his reputation as an academical teacher. Wolf systematised and popularised the philosophy of Leibnitz, but his great fundamental principle of inlying purpose by Wolf was vulgarised and weakened into external utility. His *Theologia Naturalis* treats at immense length the existence and attributes of God, and gave an impulse to that development of natural theology and rationalism which soon almost drove out revelation by rendering it unnecessary. He did not intend to question the fact of a historical revelation, but he made it impossible by the criteria of revelation which he established, and Reimarus and the thinkers of the *Aufklärung* made the further step. The Wolfian philosophy held the world until the rise of Kant; and an important section of Kant's work was a destructive criticism of Wolf's dogmatism.

Wolf's works on philosophy fill twenty-two quarto volumes. See *Christian Wolfs eigne Lebensbeschreibung*, ed. by Wuttke (1841); the 18th-century books of Ludovici; and works cited at KANT.

Wolfe, CHARLES, was born at Dublin, 14th December 1791. On the death of his father, a Kildare gentleman, the family came to England, and the boy received his chief education at Winchester. In 1809 he entered the university of Dublin, gained a scholarship, and in 1814 took his B.A. In 1817 his *Burial of Sir John Moore* was suggested by Southey's impressive account of it in the *Edinburgh Annual Register*, and soon after found its way anonymously into the newspapers. So admired was the poem that even whilst the name of its author remained unknown, and it was ascribed to Campbell, Byron, &c., it had won for itself a secure place in the heart of the nation. Wolfe in 1817 became curate of Ballyclog, in Tyrone, and then rector of Donoughmore. Symptoms of consumption appearing, he tried in search of health, successively, England, the south of France, and finally the sheltered Cove of Cork, and here he died, 21st February 1823. His literary *Remains*, consisting of sermons chiefly and poems, were published with a memoir in 1825 by Archdeacon Russell.

Wolfe, JAMES, the conqueror of Quebec, was born at Westerham vicarage, Kent, on 2d January 1727. He came of mixed Welsh-Irish-Yorkshire ancestry, the eldest son of General Edward Wolfe (1685–1759), an officer of merit and distinction, who served under Marlborough, and the beautiful Henrietta Thompson (1704–64). With his younger brother, Edward (1728–44), he was educated at Westerham and Greenwich. From the first he was bent upon following his father's profession of arms; and, balked by illness at thirteen of a share in the unfortunate Cartagena expedition, in 1742 he received an ensign's commission in a foot regiment. In 1743 he took part in the famous battle of Dettingen, boy though he was, as adjutant of his regiment; in 1744 he obtained his captaincy; and in 1745–46 he served against

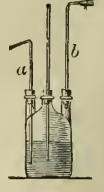
the Scotch rebels, being present at the battles of Falkirk and Culloden. Again abroad on service in 1747, he was wounded, though not seriously, at the battle of Lawfeldt, and so distinguished himself that he was publicly thanked by the Duke of Cumberland. From 1749 to 1757, with occasional interruptions, such as a six months' residence in Paris, he was engaged in garrison duty in Scotland and England; his interesting correspondence with his mother shows that he had no great liking for the former country and its inhabitants. In the mismanaged expedition against Rochefort (1757) Wolfe acted as quartermaster-general. The total failure of the operations brought disgrace to nearly all concerned; but it became known that had Wolfe's counsels been followed the result would almost certainly have been different. Pitt's attention was now first decisively drawn to him as an officer of whom great things might be expected; and in 1758, with the full rank of colonel, he was appointed to the command of a brigade in the expedition against Cape Breton under General Amherst. A brilliant success was obtained in the capture of the strong fortress of Louisburg (q.v.) after a seven weeks' siege; that it was mainly due to Wolfe's skill, boldness, and activity was clearly understood, and he became popularly known as the 'Hero of Louisburg.' Pitt was now organising his grand scheme for expelling the French from Canada; he 'sought for merit wherever it was to be found;' and the expedition which had for its object the capture of Quebec, the enemy's capital, he confided to Wolfe's command, allowing him, as far as possible, a *carte blanche* in the choice of his subordinate officers. Advanced to the rank of major-general, and commanding 9000 men, Wolfe sailed from England on 17th February 1759, and on 26th June landed his forces on the Isle of Orleans, opposite Quebec. The attack, to which he had looked forward as 'a very *nice* operation,' proved one of stupendous, indeed nearly hopeless difficulty. The system of defence adopted by his adversary, the skilful and wary Montcalm (q.v.), was such as to offer no point of advantage. In all his attempts, though seconded most ably by Admiral Saunders, who commanded the fleet, Wolfe found himself completely foiled. The season wore fast away during which operations could be continued; but at last, having dropped down the river, and scaled the cliffs at a point insufficiently guarded—a feat of such frightful risk as in war has scarcely a parallel—at the day-dawn of 13th September Wolfe found himself on the Plains of Abraham, where, his supplies thus cut off, Montcalm had no choice but to give battle. The forces were probably equal, between four and five thousand men; but Wolfe had no doubt of victory, and the result justified his confidence. After a short struggle the French were driven from the field in complete rout; Montcalm was one of 500 killed; the capitulation of Quebec followed five days after; and its fall decided the fate of Canada. Wolfe died in the hour of victory. In person he led the right, until, thrice wounded, he was carried to the rear. He lived to hear the cry, 'They run! see how they run!' and expired with the words, 'Now God be praised, I will die in peace.' His body was brought home and buried in Greenwich church, and a monument was erected to him in Westminster Abbey. He was only thirty-two; his health had always been bad, and yet he stands among the first half-dozen of our English generals.

See his *Life* by Robert Wright (1864); *Montcalm and Wolfe* by Parkman (1885); the *Life* by Bradley (1895).

Wolfenbüttel, an old town of Brunswick, on the Oker, 7 miles S. of Brunswick by rail. One of the old churches contains many of the tombs of the princes of Brunswick. The old castle now accommodates a seminary for teachers and a theatre. The library opposite, built in 1723 in the form of the Pantheon at Rome, became famous for its literary wealth and for the fact that Lessing was its librarian. It was Lessing who edited the 'Wolfenbüttel Fragments,' professedly from anonymous MSS. under his charge, but really from the pen of his friend Reimarus (q.v.), which startled the theological world of Germany. The Pantheon building had become so rickety and dangerous that it had to be taken down, being superseded in 1887 by a handsome new edifice, which houses 300,000 volumes (including 800 Bibles and a large number of incunabula) and 10,000 MSS.—one of them the 14th-century manuscript of Fordun's *Scotichronicon* stolen by M. Flacius Illyricus. There are in the town manufactures of machines, copper goods, flax, cloth, corks, leather, preserves, tobacco, &c.; pop. (with garrison) 13,453. The place is very ancient, and dates from 1046; it was besieged and taken in 1193 and 1542; and during the Thirty Years' War a battle was fought here in 1641. See a work on the town by Bege (1834) and on the library by Heinemann (1886).

Wolff, Joseph, D.D. (1795–1862), a German Jew who turned Roman Catholic in 1812, but came to England and entered the Anglican Church in 1819, becoming a missionary to the Jews in the East. He made many journeys in Persia, Egypt, India, and Abyssinia; but his most notable and adventurous journey was to Bokhara (1843), to inquire as to the fate of Conolly and Stoddart. He published accounts of his journeys and missionary labours, including the *Mission to Bokhara* (1845), and his *Travels and Adventures* (2 vols. 1860), an autobiography. He married a daughter of the Earl of Orford, and died vicar of Isle-Brewers, Somerset.

Wolffian Bodies (named after the embryologist K. F. Wolff, 1733–94), the primordial renal organs in the embryo of the higher vertebrates, performing the functions of kidneys till superseded by the true or permanent kidneys. In man they appear towards the end of the first month of fœtal life; from the third month they begin to disappear, and at birth hardly any traces are to be seen, but in the male their ducts become the excretory ducts of the testes. In fishes, on the other hand, they remain and are the permanent renal organs.

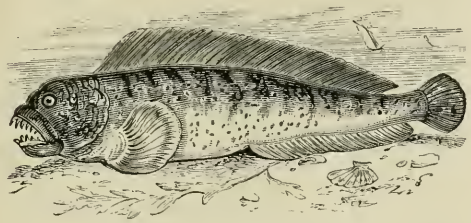


Wolffian Bottles.

Wolffian Bottles, or Woulfe's Bottles, bottles like that in the figure, named from the London chemist Peter Woulfe (1727–1806). They are used for the purpose of purifying gases, or of dissolving them in suitable solvents. The gas is passed in at the tube, *a*, which dips below the surface of the liquid, and as it bubbles through is either dissolved or passes on to a second bottle by means of the tube, *b*. The neck through which *c* passes may be fitted either with a cork or with a tube as shown, admitting air so as to prevent undue rarefaction.

Wolf-fish, or Cat-fish (*Anarrhichas lupus*), a fish related to the blennies, common in north temperate seas, and not unfrequent on northern British coasts. It is famous for its ferocious appearance and habit. The stout body is usually about 3 feet in length, but may be a foot or two more; the massive head has a blunt profile, and the open mouth, with its formidable teeth, is suggestive of a carnivorous mammal; the skin is slimy, and bears only rudimentary scales; the general colour is brownish gray, crossed by about a dozen dark bands, and spotted; the dorsal and anal fins are long, the pelvic fins are absent. The teeth are

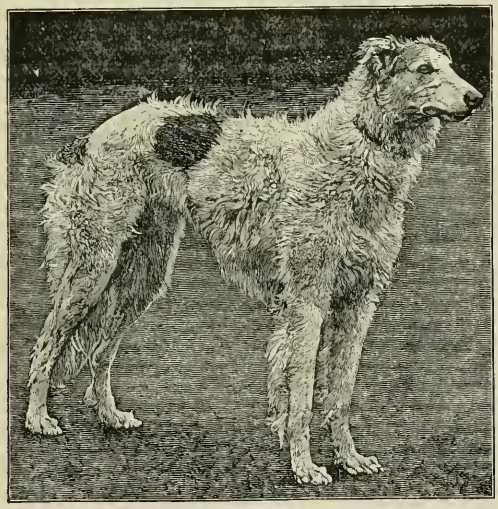
very remarkable, those in front like canines, those on the sides of the lower jaw tubercled, those on the palate pavement-like. They are adapted for seizing and crushing molluscs, crustaceans, and sea-urchins. The wolf-fish is fond of rocky bottoms, but it is often caught where it is not



Wolf-fish (*Anarrhichas lupus*).

much wanted, on cod-lines. It bites savagely when caught, and is often destructive to nets. Its ferocious appearance and habits, and its peculiar smell, are responsible for a prejudice which prevents it from being justly esteemed as a food-fish, for as such it is certainly valuable and, according to some, 'delicious.' The thick skin is sometimes made into bags. On the Pacific coast of North America there is an even larger form (*A. ocellatus*), also of use as a food-fish.

Wolf-hound, or BORZOI, a breed of dog first imported in numbers into England from Russia about the year 1885. In shape the borzoi is like a gigantic greyhound, though covered with a soft coat about the length of a deerhound's. In Britain the breed has become very popular owing to the peculiar grace and beauty of the borzoi. Though



Wolf-hound, or Borzoi.
(From a Photograph by Gambier Bolton, F.Z.S.)

supposed to be able to attack and kill a wolf, in disposition and appearance the Russian wolf-hound is so excessively gentle that doubts have been cast on his powers. In recent trials with wolves in America the borzoi failed signally to accomplish the purpose for which he is intended.—The Irish wolf-hound was identical in shape and appearance with the Scottish deerhound. Attempts have lately been made to revive the breed, but it is admitted that pure specimens are no longer obtainable.

Wolfram. See TUNGSTEN.

Wolfram von Eschenbach, a mediæval German poet, born in the end of the 12th century, near Anspach in Bavaria. He lived some time at Eisenach at the court of Hermann, Count of Thuringia, where he met Walther von der Vogelweide. His death took place after 1215. Besides *Parzival* he left seven *Love Songs*, a short epic, *Willehalm*, and two fragments called *Titurel*. Wolfram's works, written in Middle High German, were held in great esteem down to the Reformation. The *Parzival* is an epic, having for its main theme the history of the Grail (q.v.). Composed between 1204 and the author's death, it is, if we except the popular national epics, such as the *Nibelungenlied*, the greatest poetical production of German literature during the middle ages. To this supreme position it is entitled in virtue of its high imaginative qualities, its poetic truth and beauty, and its pure and lofty ethical strain. Besides it is a valuable picture and symbol of the age in which the writer lived, a translation into language of the ideals and aspirations of chivalry in its noblest phases of existence. It has been translated into Modern High German by San Marte (1886) and by Simrock (1883), the latter version being the more faithful and accurate, but the more difficult to read. It was from this poem that Wagner derived the libretto for his magnificent opera *Parsifal*.

Wolf Rock, 8 miles SSW. of Land's End, has a lighthouse (1862-69) 116½ feet high.

Wolf's-bane. See ACONITE.

Wolf-spider. See TARANTULA.

Wolgast, a Pomeranian seaport, stands on the Peene, about 10 miles from its entrance into the Baltic, and 36 miles SE. of Stralsund by rail. Large ships cannot approach the harbour. The place, which has some manufactures and a pop. of 7485, was once strongly fortified; it was taken and retaken five times between 1628 and 1675; the Russians plundered and burned it in 1713, and the Swedes retook it in 1715.

Wollaston, WILLIAM, author of the *Religion of Nature*, was born at Coton near Stafford, 26th March 1659, and educated at Shenstone and Lichfield, till in 1674 he went up to Sidney Sussex College, Cambridge. In 1681, having taken his M.A., he was ordained, and next year became an assistant-master at Birmingham; but in 1688 he inherited from a cousin a very ample estate. Thereupon he married a wife, who bore him eleven children, and retired to a house in Charterhouse Square, London, from which he was never absent one whole night in upwards of thirty years till his death on 29th October 1724. Not long before he had burned several treatises, as 'short of that perfection to which he desired and intended to bring them;' and the one forgotten work by which he is remembered was first printed in 1722 for private circulation, though it soon reached an issue of over 10,000 copies. It is a development of Samuel Clarke's system, its methods exclusively rational, its conclusions optimistic; all sin, by its showing, is a denial of what is, and heaven is a necessary counterpoise for earthly misery.

See the Life prefixed to the 6th edition of the *Religion of Nature* (1738), and chaps. iii. and ix. of Leslie Stephen's *History of English Thought in the Eighteenth Century* (2d ed. 1881).

Wollaston, WILLIAM HYDE, 'one of the ablest and most renowned of English chemists and natural philosophers,' was born at East Dereham, Norfolk, 6th August 1766. He was the second son of the seventeen children of the Rev. Francis Wollaston (1731-1815), who was the grandson of the preceding, rector of Chiselhurst, and an ardent astronomer. He went up to Caius College, Cambridge; took his M.B. in 1787, his M.D. in 1793; and gained a fellowship. Starting practice as a physician in Bury St Edmunds in 1789, he soon

removed to London; but being beaten in a competition for the post of physician to St George's Hospital in 1800, he vowed 'never more to write a prescription, were it for his own father,' but to devote himself wholly to scientific research. This resolve (which by some is ascribed to an accession of fortune) proved ultimately most beneficial, leading him rapidly to fame and wealth; for, unlike many eminent investigators of nature's laws and phenomena, Wollaston combined 'the genius of the philosopher with the skill of the artist,' and succeeded in making industrial applications of several of his important discoveries. His researches were prosecuted over a wide field, but were pre-eminently fruitful in the sciences of chemistry and optics. To the facts of the former science he added the discovery of new compounds connected with the production of gouty and urinary concretions, such as phosphate of lime, ammonio-magnesian phosphate (a mixture of these two forming the 'fusible' calculus), oxalate of lime, and cystic oxide; also the discovery in the ore of platinum of two new metals, palladium (1804) and rhodium (1805). By his ingenious method of rendering platinum malleable he made £30,000; and some other practical discoveries were also highly lucrative. His contributions to optics were the reflecting Goniometer (q.v.), the Camera Lucida (q.v.), the discovery of the dark lines in the solar Spectrum (q.v.), and of the invisible rays beyond the violet, and an immensity of valuable observations on single and double refraction. He did much to establish the theory of definite proportions, and was the first to demonstrate the identity of galvanism and common electricity, to account for the difference in the phenomena of each, &c. He was elected a fellow of the Royal Society (1793), its second secretary (1806), and a fellow of the Astronomical Society (1828). On 22d December of that last year, in which too he was awarded a royal medal, he died in London of a tumour on the brain, having just before worked out a sum to show that though speechless he was still conscious. He was a reserved and austere student, of whom yet we get pleasant glimpses in Lockhart's *Scott* and in Miss Edgeworth's *Letters*, and who on occasion was capable of splendid generosity.

See his thirty-nine memoirs in the *Philosophical Transactions* for 1809–29, and a sketch of his life in George Wilson's *Religio Chemici* (1862).

Wollongong, a seaport of New South Wales, 49 miles S. of Sydney by rail. It is a great centre for dairy-farming, and exports coal. Pop. 5000.

Wollstonecraft, MARY. See GODWIN.

Wolseley (VISCOUNT), GENERAL SIR GARNET JOSEPH, was born at Golden Bridge House, County Dublin, June 4, 1833. The Wolseleys are an old Staffordshire family, the manor of Wolseley having been in their possession before the Conquest. Educated by private tutors, and at a day-school near Dublin, he early showed a predilection for a military life, and his name was put down for a commission at fourteen. He entered the army in 1852, and since then has been constantly engaged in the service of his country, has proved himself a genuine soldier, and has delighted in dash and danger. He served in the Burmese war of 1852–53, and was dangerously wounded in the left thigh; he was severely wounded in the Crimea, where he served in the 90th Light Infantry; he lost the use of one eye, and had some marvellous escapes, and received the cross of the Legion of Honour for his bravery there. He was in India during the mutiny, and at its close received the brevet of lieut.-colonel though only twenty-six, and in the Chinese war of 1860. Next year he went to Canada, and in 1870 successfully put down the Red River rebellion under Louis Riel without losing a man. On the outbreak of the Ashantee war Wolseley, now K.C.M.G., was appointed to the command, and on his return received the thanks of parliament and a grant of £25,000 for the 'courage, energy, and perseverance' he had displayed in the conduct of the expedition; he was also presented with the freedom of the City of London and a sword. In 1875, become a major-general, he was despatched to Natal to superintend the affairs of the colony; in 1876 was nominated a member of the Indian Council. In 1878 he was made high commissioner in Cyprus, and in 1879 held supreme civil and military command in Natal, the Transvaal, and adjacent disturbed territories. He was commander-in-chief of the expedition to Egypt in 1882, received the thanks of parliament, was gazetted Baron Wolseley of Cairo and of Wolseley in Stafford, and received a money grant and became general. Made a viscount after the Soudan campaigns of 1884–85, he became commander-in-chief in Ireland in 1890, field-marshal in 1894, and was in 1895–1900 commander-in-chief. He has published a *Narrative of the War with China in 1860* (1862); the *Soldier's Pocket Book;* an essay on *Field Manœuvres* (1872); a novel (*Marley Castle*, 1877); a Life of Marlborough (2 vols. 1894); and *The Decline and Fall of Napoleon* (1895). See Low's *Memoir of Wolseley* (1878; revised ed. 1886).

Wolsey, THOMAS, cardinal, was born at Ipswich in 1471. His father, Robert Wolsey, seems to have been a grazier and wool-merchant of good substance—the story that he was a butcher having its origin only in contemporary gossip. In his eleventh year Thomas was sent to Magdalen College, Oxford, where at the age (early even for that time) of fifteen he took the diploma of Bachelor of Arts. In view of his subsequent career it is noted as a curious circumstance that his favourite study was the *Summa Theologiæ* of Thomas Aquinas, with which he became so conversant that he was known among his friends as *Thomisticus*. As a fellow of Magdalen, and master of the school attached to that college, he remained at the university till 1500, when the Marquis of Dorset gave him the living of Limington in Somerset. In 1501 he became chaplain to Henry Dean, Archbishop of Canterbury, and in 1506 a royal chaplain, acting at court as secretary to Fox, Bishop of Winchester. In 1508 he was sent on an embassy to Scotland, and in the autumn of the same year to the Low Countries to further a project of marriage between Henry VII. and Margaret, daughter of the Emperor Maximilian. As a reward for his general usefulness, Henry bestowed on him the deanery of Lincoln, the beginning of his immense fortunes.

But it is with the accession of Henry VIII. that the story of Wolsey's greatness begins. Appointed king's almoner and member of the king's council (1511), he speedily made himself an indispensable servant of the young king. In the war with France of 1513 he showed such energy and ability that Henry bestowed on him the bishopric of Tournai (an appointment never confirmed by the pope), and in the following year the sees of Lincoln and York. In 1514 Wolsey still further advanced his interests by contriving an understanding between England and France, which was the beginning of the continental policy he pursued till his fall in 1529. Though unpopular with the English people, this alliance first taught the continental powers that England was a factor to be reckoned with in all their future combinations. Wolsey was now one of the leading personages in Europe, and honours fell thick upon him from every side. He held *in commendam* the sees, successively, of Bath and Wells (1518), Durham (1523), and Winchester (1529); as also the abbey of St Albans. The year 1515 saw him Lord Chancellor of England,

and Cardinal; and in 1517 Leo. X., greatly against his will, was forced to appoint him Cardinal-legate. So great was Wolsey's predominance even at this point of his career that a Venetian ambassador said of him, 'He is seven times more powerful than the pope.' Twice, indeed, in his career he was actually within sight of the popedom itself. On the death of Leo X. in 1521 Wolsey's claim to the succession was strongly supported by Henry, and he had the promise of the emperor's good offices in his favour. But, whether Charles was sincere or not in his promise, when the choice came to be made he set aside Wolsey in favour of a candidate more likely to be at his bidding—Adrian of Utrecht, formerly his own tutor, and now acting as his regent in Spain. At Adrian's death, two years later, there was again a prospect of Wolsey's reaching the goal of his ambition; but Charles on this occasion also played him false, and another opportunity never occurred.

In the career of Wolsey, as in the development of modern Europe, a new chapter opens with the accession of Charles of Spain to the Empire in 1519. For the next quarter of a century the political history of Europe is mainly the history of the rivalry of Charles V. and Francis I. of France for the leading place among the western nations. To hold the balance between these two potentates, so that each should in turn be forced to make common cause with England, such was the foreign policy of Wolsey during the ten years he directed the affairs of his country. The skill and force with which he carried out his purposes is all the more striking that in Henry VIII. he had a master whose violent and jealous spirit would have thwarted a less able minister at every step. But with consummate art, while leading Henry to believe that he was the humble instrument of his wishes, Wolsey in reality controlled the destinies of the country. The policy of England during these years has been sketched in the account of Henry VIII. Here, therefore, it is enough to say that this policy was essentially the work of Wolsey, and that its result for England was the recovery of her place among the nations, which had been lost since the Wars of the Roses.

Wolsey's home policy was conducted on the simplest principles. In his conception it was the best interest of the country that the sovereign's will should be the one motive-power in the state, and parliaments existed simply for supplying the means for the execution of the royal commands. In accordance with these principles he made such frequent and large demands on the purse of the country that all ranks of the people detested him as the author of the ills from which they suffered during Henry's rule. Notable among Wolsey's domestic acts is his dissolution in 1524–29 of above thirty monasteries with fewer than seven inmates. This was done with the full consent of Rome; but, as it proved, Wolsey by this step led the way which Henry was afterwards to follow with such disastrous results to the ancient church in England. Wolsey's zeal for learning, as nobly shown in his foundation of a college in his native town of Ipswich, and of Cardinal College at Oxford, has always been noted as one of the redeeming traits of his character; and it is proof of the sincerity of his zeal that, in the wreck of his fortunes, one of his main concerns was that his college at Oxford should not suffer by his own ruin. The college at Ipswich, however, did not take definite shape, and Cardinal College, afterwards named Christ's College in despite to the memory of Wolsey, but inadequately fulfilled the aims of its founder.

It is part of the greatness of Wolsey's fortunes that his fate is linked with an event which is in itself a turning-point in the history of Christendom. In 1527 Henry's divorce from Catharine of Aragon became a question that took precedence of all others, and for which Wolsey had to find a satisfactory solution if he was to retain his position as the first subject in England. He had no choice but to use his best efforts to persuade Clement VII. to pronounce Henry's marriage illegal. In 1529, along with Campeggio, the legate specially sent by the pope, Wolsey sat in judgment on the case, with a result that left Henry as far as ever from the attainment of his end. This was no fault of Wolsey's, who was powerless against the diplomacy of Rome; but Henry was now in a mood that needed a victim, and the cardinal's enemies, reinforced by Anne Boleyn, had been long waiting their opportunity. Indicted for a breach of *præmunire* in procuring bulls from Rome, he was deprived of the Great Seal, and ordered to depart from his palace of York Place, and to take up his residence at Esher, near Hampton Court. Found guilty by parliament of the charges brought against him, he nevertheless obtained his pardon, and was allowed to retain the see of York. At Cawood, in Yorkshire, during the few months that were left to him, he won the hearts of the people by his charity and kindly demeanour. But his enemies could not be satisfied till his ruin was complete. On a charge of high-treason, to which he had imprudently given colour by his own intrigues, he was arrested by the Earl of Northumberland. This last stroke showed Wolsey that thenceforward he had nothing to hope, and seems to have completely broken his proud spirit. On the way to London to meet his trial he died at Leicester Abbey (November 29, 1530), with the well-known words on his lips, 'Had I but served God as diligently as I have served the king, He would not have given me over in my gray hairs.' 'No statesman of such eminence,' says Dr Brewer of Wolsey, 'ever died less lamented;' and he has remained one of the unpopular characters of English history. Except during his last days there was nothing in his character or career that was fitted to win the heart or touch the imagination of the people. They could not understand what he did for England abroad; and at home they saw the result of his policy only in the grinding taxation for which they naturally held him responsible rather than the youthful and pleasure-loving king. His arrogance and ostentation gave the greater offence in one who had come from the ranks of the people, and the tenor of whose life was so little in accordance with the profession of which he was the chief representative in the country. Disliked by the commons, he was detested by the nobility, whom his greatness overshadowed, and whom he did not think it worth his trouble to conciliate. It is only since the publication of the State Papers of the period that Wolsey has received his due as a statesman of the first rank, whose ambition was coincident with the interest of his country as he conceived it. While his public aims, however, are thus seen to have been nobler than his contemporaries supposed, in his personal character, in his embodiment of a type of churchman most alien to the religion which he represented, Wolsey still remains a figure associated with no principle of beneficence, and essentially repellent in all the salient features of his mind and heart.

See CROMWELL (THOMAS); Lives of Wolsey by George Cavendish (q.v.), Wolsey's gentleman-usher, from which the splendid figure in Shakespeare's *Henry VIII.* is closely drawn, Fiddes (1724), Grove (1742), Galt the novelist (1812), Martin (1862), Bishop Creighton ('English Statesmen' series); Lord Acton, 'Wolsey and the Divorce,' in the *Quarterly Review* for January 1877; Brewer, *Reign of Henry VIII.*; and Gasquet, *Henry VIII. and the English Monasteries* (1888–89).

Wolverhampton, a municipal, parliamentary, and county borough, the 'metropolis of the Black Country,' stands on a gentle eminence amid a network of railways and canals, 13 miles NW. of Birmingham, 15 S. of Stafford, and 126 NW. of London. It was first called 'Hamton,' and then 'Wulfrunishamton,' after Wulfruna, King Edgar's sister, had founded in 996 St Peter's Church, which continued collegiate till 1846. Rebuilt during the 13th, 14th, and 15th centuries, and enlarged and elaborately restored in 1859–65 at a cost of £10,000, that church is a fine cruciform Gothic edifice, with a rude stone cross in the churchyard, a carved stone pulpit of 1480, and monuments to Admiral Sir Richard Leveson (1570–1605) and Colonel Lane (d. 1667), who assisted Charles II. in his escape from Worcester. Otherwise the public buildings are all modern—the town-hall (1868), in the Italian style, corn exchange (1853), market-hall (1853), agricultural hall (1863), hospital (1849), post-office (1873), art gallery (1885), drill-hall (1886), &c. A bronze equestrian statue of the Prince Consort was inaugurated by Queen Victoria in 1866; and there is also a statue (1879) of the Right Hon. C. P. Villiers (q.v.) of Corn-law fame, first returned as M.P. for Wolverhampton in 1835, and re-elected in 1892. The public park (1881) was laid out at a cost of £16,000. The free grammar-school, which was founded in 1512 by Sir Stephen Jenyns, Lord Mayor of London, and at which Abernethy and Sir W. Congreve were educated, occupies handsome new buildings of 1876; and there are also a blue-coat school (1710) and an orphanage (1850). Sir Stephen was a native; so too was the great Mr Jonathan Wild. Bishop Pococke described Wolverhampton in 1757 as 'a great manufacturing town in all sorts of toys, and particularly of locks in the greatest perfection;' and locks —some two million yearly—are still its specialty, the Messrs Chubb's works being here. The other manufactures include tinplate, japanned goods, enamelled hollow wares, edge-tools, gas and water tubes, electro-plate, papier-maché, chemicals, &c. The town stands on the western edge of the great coal and iron mining district of South Staffordshire, so that the vicinity on the south and east is all covered with collieries, ironstone mines, blast-furnaces, forges, iron-foundries, and rolling-mills, whilst on the north and west there is pleasant green country—Boscobel (q.v.) is only 8 miles distant. Wolverhampton was enfranchised in 1832, returning two members to parliament (three since 1885), and it was made a municipal borough in 1848, a county borough in 1888. The Wednesday market is held under a charter of 1258. Pop. of parliamentary borough (1851) 119,748; (1881) 164,334; (1891) 174,325, of whom 82,620 were within the municipal and county borough. See works by G. Oliver (1836), F. Hall (1865), Steen (1871), and J. Fullwood (1880).

Woman's Rights. See WOMEN'S RIGHTS.

Womb, or UTERUS, a flattened, pear-shaped organ, lying in the line of the axis of the outlet of the Pelvis (q.v.), with its base directed upwards and forwards, and its narrower neck or *cervix* directed downwards and slightly backwards. In the unimpregnated condition it is about 3 inches in length, 2 in breadth, and 1 in thickness, and weighs about an ounce and a half. On laying it open its cavity is found to be very narrow, and to contain only a little mucus. Its walls are nearly half an inch thick, and are mainly composed of muscle-cells and fibres running irregularly in all directions except round the *os*, where they make a partial sphincter. This muscular layer, which constitutes the bulk of the organ, is covered externally with a serous coat, derived from the peritoneum, and is lined internally by a mucous membrane continuous with that of the canal called the *vagina*, by which the interior of the womb communicates with the outer surface of the body. This mucous membrane abounds in small mucous follicles, and is provided with ciliated Epithelium (q.v.). The lower end of the cervix projects slightly into the vagina, communicating with it through the *os uteri externum*, which is nearly round in the virgin, and transverse after parturition. This orifice leads into a narrow canal which terminates at the upper end of the cervix in a smaller opening, the *os internum*, beyond which is the shallow triangular cavity of the womb, of which it forms the lower angle, while the two upper angles, which are funnel-shaped, constitute the beginning of the Fallopian Tubes (see under OVARIES), whose apertures are so small as only to admit the passage of a fine bristle. The blood-vessels and nerves enlarge in a very remarkable way during pregnancy, so as to adapt themselves to the increased wants of the organ, which, at the ninth month of utero-gestation, weighs from 1½ to 3 lb. The term *appendages to the uterus* is given to the Fallopian Tubes and Ovaries (q.v.), which are enclosed by the lateral folds of the peritoneum called the broad ligaments. The womb is suspended in the pelvic cavity in such a way as, by its mobility, to escape rude shocks from without or disturbance from the varying conditions of the surrounding viscera, while at the same time it is able to increase vastly in bulk with comparatively little discomfort when pregnancy occurs. This is effected by several duplicatures of peritoneum, containing variable quantities of fibrous and muscular tissue, and known from their form or connection as the *broad*, the *round*, the *utero-sacral*, and the *utero-vesical* ligaments.

The uterus is an organ peculiar to the Mammalia, and in comparatively few of them (excepting the Apes and Cheiroptera) is it of the simple oval or triangular form which we have described. It is *two-horned* in the Ruminantia, Pachydermata, Solipedia, and Cetacea; and it is said to be *divided* where, as in most of the Carnivora and Edentata, and some Rodentia, it has only a very short body, which speedily divides both externally and internally, and is continuous with the oviducts or Fallopian tubes. The uterus is actually *double* in some of the Edentata, and in most of the Rodentia, including the mouse and hare; in which each Fallopian tube passes into an intestiniform uterus, which has two completely distinct openings lying near to each other within the vagina. In the Marsupiata and Monotremata the modifications of this organ are still more singular.

The chief offices or functions of the womb may be divided into those which relate to (1) Menstruation, (2) Insemination, (3) Gestation, and (4) Parturition.—For further details, see the standard works on anatomy and physiology.

DISEASES OF THE WOMB.—In consequence of its mobility, but particularly of the periodical changes it undergoes during the processes of menstruation and childbearing, the womb is an organ extremely liable to disease. It is of course quite impossible in such a work as the present to do more than indicate generally some of the more important of the morbid conditions met with and their symptoms; the more, as even a trained observer can seldom decide from the progress and symptoms of a case without a thorough examination what the nature of the disease really is.

Malformations occur as a result of imperfect development; the womb may be small or rudimentary, or it may be double throughout or in its upper part, as is normally the case in some of the lower animals.

Displacements forwards or backwards are common in consequence of the mobility of the organ. Their exact causation is not always perfectly understood; but they often lead to much pain and discomfort, to inflammation of the organ, to disturbance of menstruation, and to sterility. In many cases they may be remedied by mechanical means.

Prolapse, or displacement downwards of the womb, generally occurs in consequence of injury during childbirth. The cervix, or even the whole womb, may project from the orifice of the vagina, causing great distress and discomfort. Mechanical support, with or without previous operation, will usually give relief.

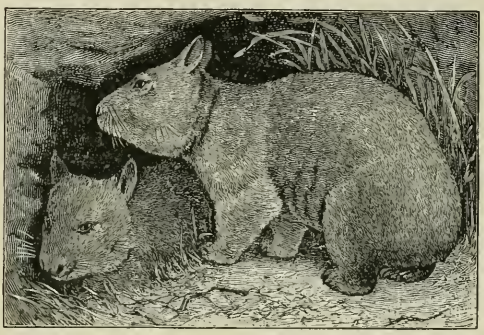
Inflammation, affecting the cervix only or the whole womb, often follows childbirth, or may result from displacement of the womb, cold, and other causes. But the most fruitful sources of it are probably neglected miscarriages; for it is not sufficiently recognised that almost as much care is required to ensure complete restoration to health after a miscarriage as after a confinement. Various forms and degrees of inflammation vary much in their results, but generally speaking they lead to abnormal discharge from the vagina (popularly called 'whites'), irregular menstruation, pain in the back and pelvis, and often to great constitutional weakness and nervous disturbance. The most suitable treatment varies much in different cases, but is often tedious and troublesome.

The womb is a very frequent seat of *tumours*. In many cases the chief symptom is excessive menstruation; but in some forms of fibroid tumour there may be such an absence of symptoms that the growth is discovered only by accident. Pedunculated tumours, or Polypi (q.v.), within the uterus can generally be removed with little trouble or risk. '*Fibroid*' tumours, consisting of fibrous tissue with a variable proportion of unstriped muscular fibre, resembling that normally present in the uterus, are by far the most frequent tumours in this situation. They are most common in middle life; after the 'change of life' they usually cease to grow, or to give rise to any symptoms except those due to their mere mechanical presence. They may be of enormous size; tumours of 70 or 80 lb. have been met with. Considering their frequency, it is surprising how seldom they lead to the death of the patient; but they often cause excessive hæmorrhage and great debility. When situated near the internal surface of the womb, they are sometimes expelled spontaneously. Removal by ordinary surgical methods has often been practised in severe cases, and with steadily improving results. In 1884 Dr Apostoli of Paris brought into notice a method he has introduced of passing strong electric currents through the womb, for which he claims that it produces diminution of hæmorrhage and practical cure in many cases without the risks of an operation. Medical opinion is still much divided as to the results and value of this procedure.

Malignant tumours of the womb are also very common; of all the organs of the body indeed this is by far the most frequent seat of cancer. In the vast majority of cases the disease begins in the cervix; and at an early stage it may sometimes be removed with success. But if not completely eradicated it speedily spreads to neighbouring parts, and a fatal result is inevitable. It is rare before thirty years of age; most common between forty and sixty. The first symptom is usually hæmorrhage; pain is rarely present in the earlier stages, and may be absent throughout. Sarcoma is sometimes met with, but is much less common than cancer in this situation.

See also GESTATION, MENSTRUATION, OBSTETRICS, OVARIOTOMY, REPRODUCTION, and works cited at STERILITY.

Wombats (*Phascolomyidæ*), a family of marsupial mammals, resembling in many characters the rodents. There are no canines, and the incisors are large and with enamel only on the front surface; there are only two in each jaw, growing, like all the teeth, from persistent pulps. The molars are ten in each jaw. The limbs are stout and short, with five toes, all provided with long curved claws, except the very short first toes of the hind feet, which are nailless. The tail is rudimentary. In their general form and actions the wombats resemble small bears, having a similar shuffling plantigrade walk; but they are even shorter in the legs and broader in the back than those animals. They live on the ground and in burrows or holes among rocks, feeding on roots, grass, and other vegetable substances. They sleep in the day, seeking their food at night, and are usually gentle in their habits, though their large chisel-like incisors enable them to bite strongly if provoked. There is one existing genus, containing three species. The wombats of Tasmania and the islands of Bass Strait (*P. ursinus*) and the larger species (*P. mitchelli*) of the southern mainland of Australia have rough and coarse fur, a smooth muzzle, and short rounded ears. The larger species



Wombat (*Phascolomys latifrons*).

is very variable in colour, ranging from pale yellowish brown to black. *P. ursinus* is brownish gray, like the third species, the Hairy-nosed Wombat (*P. latifrons*), which differs from the other two in having smooth silky fur, a hairy muzzle, and large pointed ears. It inhabits Southern Australia. The largest living wombat (*P. mitchelli*) is about 3 feet long, but remains of a large extinct genus (Phascolonus), which must have been nearly as large as a tapir, have been found in Queensland. See Gould's *Mammals of Australia*.

Women's Rights is a name given originally by its promoters, but afterwards more frequently used by its opponents and detractors, to the movement, called by Mr George Meredith 'the most indigestible fact of our century,' of women towards personal and proprietary independence. The social, legal, and economic changes which these words imply have in no country at present been completely worked out, but the process has begun and is in a different stage towards its completion in every country of progressive civilisation. The largest strides towards the complete independence of women have been made in the United Kingdom, the Australian colonies, and the United States of America. It would not be possible in the space allotted to this article to trace the movement with any degree of completeness, even in these three countries, still less in the various countries of Europe which are largely affected by it. Attention will therefore here first be drawn to the

Copyright 1892 in U.S. by J. B. Lippincott Company.

general causes which have given rise to the movement and account for the universality of its operation, and then to a brief outline of its recent development in Great Britain. It is to be particularly observed that the whole of modern society has been influenced by this movement; it is a living social force from Scandinavia to India, from San Francisco eastwards to the Ural Mountains, producing its reflex in all modern literature, laws, and institutions.

Sir Henry Maine points out in *Ancient Law*, and also in *The Early History of Institutions*, that this movement is really part of a far larger movement—i.e. the gradual emancipation of the individuals forming the family group from the absolute control of the head of the family. In patriarchal times every individual in the family group was completely subject to the *patria potestas;* sons, servants, children, wives could hold neither property, liberty, nor life except at the good-will and pleasure of the head of the family. The subordinate members of the family had no rights, no responsibilities, and no duty beside obedience. Little by little the absolute rule of the head of the family over the various members of the family group was encroached upon. The first step was a recognition of different kinds and degrees of power; at first the patriarchal power was identical in character over the whole of the persons and possessions of the family. The power over flocks and herds was not more absolute than that over sons, slaves, or wives; but gradually a difference was felt to exist, and different names were given to the different kinds of power exercised by the head of the family over the different members of it. Over material possessions and slaves it was called *dominium;* over children it was *potestas;* over free persons serving the family it was *mancipium;* over the wife it was and is *manus*. In the gradual development of modern society all the members of the family group, except the last, have completely emancipated themselves from the absolute control of the head of the family. The emancipation of women has proceeded more slowly than that of the other members of the family group; but the germ of it has been present from the dawn of history, and has been more or less widely recognised and developed in all progressive societies. Sir Henry Maine attributes in a very large degree the difference between the stagnant civilisation of the Hindu races and progressive civilisation of the Romans and the races influenced by Roman institutions to the fact that the latter have steadily and voluntarily relaxed the subjection of women, while the former have recoiled from these changes, and have used the combined authority of religion and law still further to complete the seclusion and degradation of the female sex.

The movement towards the emancipation of women is one from status to contract, from communism to individualism, from a condition in which the individual creates for herself few or no rights, few or no duties, to one in which she develops personal responsibility and independence. This view of the subject may suggest to the observer reasons which account for the universality of the women's rights movement wherever progressive societies exist, the different stages of its development in different countries being traceable to local causes. 'The movement of progressive societies has been uniform in one respect. Through all its course it has been distinguished by the gradual dissolution of family dependency, and the growth of individual obligation in its place. The individual is steadily substituted for the family as the unit of which civil laws take account' (*Ancient Law*, p. 168). The most casual observer is aware that very much has been done in this direction so far as women are concerned in Great Britain during the 19th century. The husband no longer acquires by the mere fact of marriage control over the property of his wife (Married Women's Property Act, 1882); certain limited rights of guardianship over her children have been secured to her by law (Custody of Infants Act, 1886). Formerly all the children of a marriage were wholly under the control of their father, the mother possessing, even after the death of her husband, no authority except as his deputy. By the abolition of imprisonment (by an act passed in 1884) as the punishment for refusing an order of court for the restitution of conjugal rights, a wife's right to have control of her own person has been established. Minor alterations of the law, such as that which has recently improved the legal position of the wife in case of the intestacy of her husband, in the event of desertion by her husband, &c., are of tolerably frequent occurrence. The movement is perhaps not very rapid, but it is all in one direction; it is like a glacial drift, you cannot see it move, but when you look again, after a sufficient interval, you see that it has moved, and it always moves in the direction of increasing the personal and proprietary independence of women.

One main reason why this movement has been so much more marked during the 19th century than in any preceding time may probably be found in the economic changes accompanying the application of steam and labour-saving appliances to manufactures. The immense development of manufacturing as contrasted with domestic industries has laid the foundation of economic independence for the great mass of working women. When a woman works as a member of a family group, the result of her work belongs not to herself, but to her family—that is to say, generally speaking, to her father or her husband. When a woman works in a factory her wages are her own property; she has passed from family dependency to self-dependency. The difference is not so much that working women work more than they did: the great mass of people must always work in order to live; but the result of their labour in the shape of wages forms a fund over which the worker now has the sole control, whereas in earlier times all she produced belonged to another, who in return certainly allotted her board and lodging, but believed himself to be doing so out of his own property, and not out of hers. Even now the domestic work of women is not often esteemed at its proper economic value. In an average working-class family the man is usually called the 'bread-winner.' He would say in perfect good faith that he 'kept his wife and family.;' although the working-class mother, if she is an industrious woman with an average-sized family, leads a life of almost incessant toil for their benefit. The woman who cleans, sews, cooks, and washes for a man and six children 'keeps' the family quite as essentially as the man who turns a lathe or ploughs the land, and thereby brings in a weekly sum of money to the family purse. The value in money of women's work in a factory may probably before long cause a more general recognition of the value in money of women's domestic work. Its value in a sense that is beyond all money, if she does her duty to her children, fortunately stands in no need of emphasis.

The view that the recent rapid development of the Women's Rights movement rests on an economic basis receives confirmation from the fact that the greatest progress towards the independence of women has been made in those countries (Britain and its colonies, and the United States) that have been foremost in adopting modern economic changes in the application of steam and labour-saving machinery to industry. Countries that are

most backward industrially are also most backward in raising the condition of women. Where the industrial development of a country offers the opportunity of economic independence to women social independence with all its various ramifications makes rapid progress; education, entrance into the professions, wider opportunities of work, of knowledge, of enjoyment, a share in public life and political liberty are demanded, and in Britain have been or are being secured.

The first fully conscious demand on the part of women in England for education, for employment, for political liberty, is to be found in Mary Wollstonecraft's *Vindication of the Rights of Women*, published in 1792. Mr Lilly in his book *On Shibboleths* (1891) devotes a chapter to an attack on Women's Rights, in which he asserts that after the publication of Mary Wollstonecraft's book, 'which made a certain stir,' but was 'soon forgotten,' the question of women's rights slumbered for seventy years, till it was revived by John Stuart Mill. The importance of Mr Mill's services to the women's movement cannot be exaggerated; but it is incorrect to assert that it had slumbered till he awoke it; during the 19th century the question has never slumbered; the foremost minds of the time have dealt with it and led it. From the somewhat erratic but brilliant and meteor-like championship of Shelley, the great literature of the century has never ceased to concern itself with the women's rights question. *Aurora Leigh* is an essay on women's rights which touched the relation of men and women at its very foundation with a master-hand and fearless decision. That it was recognised in this character by some at least of the opponents of women's rights is evident from Edward FitzGerald's outburst on the occasion of Mrs Browning's death: 'No more Aurora Leighs, thank God! A woman of real genius, I know; but what is the upshot of it all? She and her sex had better mind the kitchen.' Tennyson could not keep his pen from women's problems, and dealt with them to the disgust and astonishment of his friend FitzGerald in *The Princess*. The works of the Brontë sisters, especially Charlotte Brontë's *Shirley*, are full of the working of the ferment of women's rights. The same may be said of nearly all George Eliot's writings, of innumerable passages in Thackeray's, and continues to be true of the literature of our own times down to the *Story of an African Farm*, the works of Charles Reade, Mr George Meredith, Mr Thomas Hardy, and above all of the writings of Tolstoi, Ibsen, and Björnstjerne Björnson.

But the new force of the movement towards women's rights has made itself felt not only in what has been written by women and about women, but in what women have done, in the practical work they have accomplished. The women writers we have named and many others, including some who vehemently denounce the movement, are its products. We could not have had a Mrs Browning, nor a Mrs Somerville, a Harriet Martineau, nor the Brontës, Mrs Fry, Miss Octavia Hill, Miss Nightingale, Mary Carpenter, nor even a Mrs Lynn Linton and Mrs Humphry Ward, if the women of the 19th century had still been condemned to

> A sort of cage-bird life, born in a cage
> Accounting that to leap from perch to perch
> Was act and joy enough for any bird.

The opening of ordinary industrial employments which was brought about by large economic forces affecting the whole of society must be regarded not as a product of the women's rights movement, but as the principal material cause of its recent rapid development. Supplied with that motive power, the momentum acquired has been sufficient for many conquests. Many other employments and professions, notably that of medicine, have been opened to women; the lady journalist has made a position; other occupations in the hands of women from time immemorial (e.g. nursing and teaching) have been re-created and a wholly new spirit breathed into them. Education for girls and women not inferior in quality to that provided for boys and men has been successfully struggled for. Queen's College, opened in 1848 through the initiative of the Rev. F. D. Maurice and Dr (afterwards Archbishop) Trench, was the first attempt to provide university education for women in England. Bedford College, founded by Mrs Reid, was the next to follow. The national importance of girls' education was recognised by including girls' schools in the purview of the Schools Enquiry Commission appointed in 1864. The doors of the older universities were knocked at a few years later when Miss Emily Davies organised a petition to the university of Cambridge to open its local examinations to girls. This prayer was granted in 1865, and was the first recognition in England that the universities have duties in regard to women's education. The movement thus initiated resulted, mainly under the able guidance of Miss Davies, in the establishment of Girton College. About the same time the North of England Ladies' Council of Education—of which Miss A. J. Clough (1820-92) and Mrs Josephine Butler were leading members—began courses of lectures for women by university lecturers in a group of northern towns. Out of the demand that was thus found to exist for higher instruction for women sprang two important institutions: (1) the university extension movement, with its corollary in the University Colleges now existing in nearly all the most important centres of population throughout the kingdom, and (2) Girton College (q.v.) and Newnham College (q.v.), the one opened in 1869, the other in 1871. Conspicuous amongst the promoters of Girton was Madame Bodichon (1827–90), born Augusta Leigh Smith, the daughter of a Norwich M.P., and herself an accomplished water-colour landscape-painter. In 1881 the Cambridge senate passed a grace by an overwhelming majority (258 to 26) to open their honours examinations to women students of Newnham and Girton, without, however, conferring the degree upon them. Oxford followed Cambridge, though not upon identical lines. Durham opened its degrees in 1895. Cambridge rejected in 1897 the proposal to grant degrees to women. Permissive powers were in 1892 given to the Scottish universities to admit women to a degree in any faculty, and to make provision for the instruction within the university of women in any subject. In 1896 there were 188 women matriculated, 56 non-matriculated women students, and 68 attending extra-mural lectures in medicine. London University opened all its degrees to women in 1878, and since that date all other newly-founded universities (the Royal in Ireland, the Victoria in England, and the Welsh University) have admitted women to a position of perfect equality so far as degrees are concerned. Meanwhile secondary education for girls had been undergoing a revolution not less searching than that which has converted the ignorant and gin-drinking Mrs Gamp of former years into the trim, deft-handed certificated nurse of to-day. What Florence Nightingale and her coadjutors did for nursing and nurses Mrs William Grey, Miss Shirreff, Miss Buss, Miss Beale, and others have done for the teachers and the taught in girls' schools. The result of improving the education of girls and women has been the overthrow of many cherished convictions, or rather prejudices formed without knowledge, on the limitations of the female intellect. Women have shown themselves capable of benefiting by the highest kind of instruction

which a university can afford, and again and again in recent years the blue ribbon of the various triposes has been won by a girl student. The result has been a larger number of women engaged in scientific pursuits, in historical, archaeological, and classical research. Of the direct value of their work in increasing the sum of human knowledge experts alone have a right to form an opinion; but of the social advantages to the women themselves and to the society of which they form part there can be no doubt:

> Get leave to work
> In this world—'tis the best you get at all:
> For God, in cursing, gives us better gifts
> Than men in benediction. . . .
> Get work, get work:
> Be sure 'tis better than what you work to get.

A further social benefit has accompanied the opening of various avenues of work to women; it has increased the opportunities of comradeship and multiplied the bonds of friendship between men and women. The number of points at which their lives touch and run in unison has been increased. There are links of sympathy between them in the study as well as in the kitchen. It is almost as impossible to conceive of a modern man saying of any woman of genius 'she and her sex had better mind the kitchen' as it is to conceive of any modern man thinking of women as Pope, Lord Chesterfield, and Milton wrote of them.

A few words must be given to the successful struggle on the part of women to obtain medical education and an equal status with men in the medical profession. Dr Elizabeth Blackwell (q.v.) was the first woman upon the English medical register. She was placed upon the register in 1859 in virtue of a foreign degree (Geneva, U.S.A.). Later on foreign degrees ceased to give their owners a claim to be placed on the English medical register, and the second Englishwoman who desired to study and practise medicine had to enter by another door. Miss Elizabeth Garrett, now Mrs Garrett Anderson (q.v.), M.D., began her work of opening the medical profession to her own sex in 1860. After much effort and many repulses from various licensing bodies, she discovered that the Society of Apothecaries had no power under their charter to exclude her. She obtained their license and was placed on the register in 1865. This entrance for women into the profession was almost immediately afterwards closed. Three other women presented themselves in 1867 for the preliminary examination and passed successfully; the council of the Apothecaries Society was immediately called together, and a resolution was passed which had the effect of excluding women in future from the examinations of the society. Many years of unremitting effort followed: in Edinburgh an extraordinary degree of acrimony was manifested by the opponents of the women students. All means of getting upon the English register were closed, but women continued to get their medical education abroad, at Paris, Zurich, &c., and returned to practise in England. A women's dispensary and hospital was opened with a staff of women; then followed medical schools for women in London, and a little later in Edinburgh, Glasgow, Dublin, Belfast, and Cork. In 1876 an 'Enabling Bill' was passed by Mr Russell Gurney, which empowered all the licensing authorities in Great Britain and Ireland to open their examinations to women if they were so disposed. The first examining bodies to avail themselves of this power were the King's and Queen's College of Physicians, Ireland, and the Queen's University, Ireland. They were quickly followed (in 1878) by the London University, and no legal hindrance any longer obstructs the entrance of women into the profession. The change that has since that time taken place in the view of the majority of medical men with regard to women doctors is illustrated by the fact that in 1877 the British Medical Association at its annual meeting passed a resolution declaring in future all women to be ineligible as members, and in 1892 the same body, meeting at Nottingham, rescinded this resolution by the enormous majority of 600 to 4. In 1892 a movement was on foot to open the medical classes of the Cork Infirmary to women.

No account of women's rights would be complete which did not touch upon the great struggle against the worst of women's wrongs, the forcible subjection of women to the lowest animal instincts of men. In France and in other Latin countries women of a certain class are treated like cattle, and are absolutely at the disposal of the wretches who farm their destruction for their own pecuniary profit. White slavery is a term that but feebly indicates the horrors of the system. Mrs Browning throws light from the fire of her genius on this dark chapter of women's wrongs in the story of Marion Erle in *Aurora Leigh*.

> I was not, as you say, 'seduced,'
> But simply murdered.

There are men in every country who use their command of wealth, of physical strength, of mental subtilty to subdue a woman to their vicious instincts, and then despise her for being what they have made her; they execrate her for not having what they have robbed her of. The legal position of women of this class has never been so terrible in England as in France and other continental countries; but an attempt was made in 1866 and in 1868 by the passing of what were known as the Contagious Diseases Acts, to introduce part at least of the continental system into the English garrison towns. The acts were passed and were in operation for twenty years, but throughout these twenty years an unceasing and most active agitation was kept up for their repeal, led with persistent courage by Mrs Josephine Butler. The acts were repealed under the parliamentary leadership of the Right Hon. James Stansfeld in 1886; they have since that time been condemned by the medical profession (Hygienic Congress, 1891) as completely useless from the hygienic point of view; but this was not the motive power which brought about their repeal. This was supplied by the steadfast resistance of the women of England, led by Mrs Butler, to the doctrine that vice was necessary, and being necessary the state was bound to provide, at the expense of the personal liberty of the women sacrificed to it, that it should be as little dangerous as possible. Directly growing out of this movement other reforms have been forced upon an unwilling legislature with the object of giving greater protection to women and girls from the vicious and mercenary instincts of depraved men and women. The age of consent has been raised from thirteen to sixteen; and many offences against women, not formerly recognised as such by law, have been made criminal. Much has been done in this field towards the reparation of the wrongs of centuries, but much still remains to do.

With regard to the claim of women to take part in public life, to share in political work and responsibility, many changes in the direction of conceding what the Women's Rights party demand have been made, but the battle still rages loud and long over the claim to the parliamentary franchise. The women of Great Britain now exercise the municipal, school board, board of guardians, county council, and parish council suffrages; and they sit in parish councils, on school boards, and on boards of guardians, where their influence has been in the

highest degree beneficial, especially in the care of the aged and infirm in the workhouse infirmaries, and in the education and nurture of panper children. If there are any children in the world that have a mother-want, it is the children in workhouses. This want the lady guardian, where she exists, has done much to supply. Women's suffrage formed part of the Local Government Acts of 1888 and 1893, passed by Conservative and Liberal governments respectively; in the second of these, amendments were inserted enabling married women, if otherwise qualified, to vote in parish council elections, and also rendering women eligible for seats in parish councils. There has been little opposition to the extension to women of powers of this kind. Considerable opposition is, however, still provoked by the proposal to confer the parliamentary franchise on duly qualified women. But in proportion to the effort that is made in the House of Commons against women's suffrage the parliamentary majority against it is remarkably small. In the session of 1892 a whip against a very moderate women's suffrage bill introduced by Sir Albert Rollit, Conservative member for Islington, was signed by twenty leading members of parliament representative of every section of the House, including Mr Chamberlain, Mr Labouchere, Sir William Harcourt, and Lord Randolph Churchill. The attack on women's suffrage was further supported by a pamphlet from the pen of Mr Gladstone. Notwithstanding this remarkable combination of hostile forces, the majority against the second reading (23) only very slightly exceeded the number of members who had signed the hostile whip, the numbers being, with tellers and pairs, 179 to 202. The reason of this small majority against women's suffrage is probably to be found in the activity of women in political work. The intense interest awakened on both sides on the subject of Home Rule for Ireland led to the formation in each political party of women's political associations. The Conservative party was first in the field of social change, the Primrose League being formed in 1883, some years before the other political party had encouraged any political organisation among women. Women are now found to be extremely efficient as canvassers, in looking up out-voters, and also in addressing political meetings. The difficulty of maintaining that women are fit to do political work, are in fact fit to advise voters how to vote, but are not fit to vote themselves, amounts in many minds to an impossibility. This is especially felt by members of parliament from the fact that the great majority of women who are able and willing to do political work are strongly in favour of the political emancipation of their own sex. Just before the division on women's suffrage in 1892, 168 branches of the Women's Liberal Federation petitioned their members in favour of the bill. In the immediate prospect of a general election these petitions carried more than ordinary weight. Women's suffrage is now in the peculiar position of receiving support mainly from two sources—the leaders of the Conservative party, and the rank and file of the Liberal party. The Marquis of Salisbury and the Right Hon. A. J. Balfour support it, and the National Congress of Conservative Associations meeting at Birmingham in November 1891 passed a resolution in its favour by an overwhelming majority. The leaders of the Liberal party, however, as a whole, give it no support; they are aware from former experience that the Liberal feeling in the country favours it; they will not therefore suffer the subject to be discussed at their party conferences in the provinces. The belief no doubt exists that an extension of the parliamentary suffrage to women householders would tend to strengthen the Conservative party, and this accounts for the anomalous features of the political position of the question. It is based on Liberal principles, but would be advantageous to the Conservative party. This is, however, the mere accident of the moment, and the whole situation as regards the political prospects of the question may probably enter a new phase before many years have passed.

In the Isle of Man women have voted in the election of members of the House of Keys since 1880. In New Zealand, after a short but keen struggle, women's suffrage was finally carried in September 1893; and in the following November women voted for the first time in a parliamentary election. The women availed themselves of the new privilege in large numbers; they were everywhere treated with respect and consideration. The women's vote did not produce a change of government. At the general election of 1893 there were 193,536 men and 109,461 women electors on the rolls. In South Australia the suffrage was given to women by an act of 1894. Women are now also on an equality with men in Iceland, Jersey, and Pitcairn Island. Experience is favourable to women's suffrage; the general feeling where it has been tried is overwhelmingly in its favour; it has produced none of the disasters that its opponents confidently predicted of it. This favourable experience cannot be without its weight; it is not, however, probable that the House of Commons will be very materially influenced by the experience of localities the circumstances of which are so widely different from those of the United Kingdom. If Englishwomen are to gain political emancipation, it will be by their own political work and by convincing the majority of their countrymen that they can be included in the rights and duties of political citizenship without risk and with advantage to the interests of the nation as a whole. Those only appreciate the whole significance of the present effort for the political emancipation of women who recognise in it a phase of that larger women's rights movement which is the subject of this article.

In the United States the movement began in connection with the anti-slavery agitation in 1848; and from 1852 till the civil war annual meetings were held. The suffrage has been granted to women in Wyoming (1869), Colorado, Idaho, and Utah. In some states they have the municipal suffrage; in about half of the states the right of women, married and unmarried, to direct representation in public school questions is recognised. In all the states the profession of medicine is open to women; in almost all the states where the question has been raised women are empowered to enter the legal profession. By special act of congress they may even be commissioned attorneys-at-law of the Supreme Court; and by the federal government they may, as citizens, be commissioned as 'post-mistresses, United States marshals, captains of steamboats, surgeons in the army, nurses and matrons in government hospitals, clerks in the several departments of government.' Many colleges and universities admit women to full medical and legal courses. The oldest universities and colleges do not admit women to a full course of instruction in all departments; but most of those founded since 1840 receive men and women on equal terms. The first women graduates were three, in 1841, from Oberlin. There are few colleges for women alone; the most famous of them are Vassar (q.v.) and Smith College at Northampton, Massachusetts. Bryn Mawr College, 10 miles from Philadelphia, follows the 'group system' of studies as organised in the Johns Hopkins University. It was founded

in 1880 in this village, originally settled by Welshmen, and was opened in 1885.

Wonders, Seven. See Seven Wonders.

Wood, or Xylem of the botanists, has a wider significance than that in popular use. Nearly all plants, from ferns to flowering plants, have veins or ribs in their leaves. These ribs consist of tubes or vessels (sap-carriers) supported by strong skeleton-work of fibres; hence they are called fibro-vascular bundles. Usually throughout the length of these bundles there are two groups of elements in close connection; the upper is the wood whose vessels carry sap from the roots by way of the stems to the leaves, and the lower is the bast whose sieve-tubes convey the elaborated sap (see Vegetable Physiology) down to the stem and to all growing parts of the plant. The bundles pass from the leaves into the stem, where they form a network having all the wood elements in Phanerogams (q.v.) turned towards the heart of the stem and the bast elements to the outside. It is only in the stems of phanerogams that wood in the sense of Timber (q.v.) is formed. Further, wood is formed only in those plants in which the bundles arrange themselves close together in cylinders around a common centre called the pith or medulla, while a removable Bark (q.v.) is always formed outside after the first or second year's growth. Stems of Gymnosperms (q.v.) and Dicotyledons (q.v.) have this arrangement, and it is from these two groups of plants that all true timbers are got. Stems of Monocotyledons (q.v.), including such as palms, have not got this concentric arrangement of bundles and removable bark, consequently in them no close wood is formed. If a one year old stem of the dicotyledonous (obsolete exogenous) type—i.e. Gymnosperm or Dicotyledon—be broken across, the fibres or bundles will be seen protruding. If the stem be cut across with a sharp knife the arrangement represented in fig. 1, I. will be easily seen with the help of a simple lens. Between the wood and bast of each bundle is a layer of living cells, called the cambium or growing layer, from which all the new wood and new bast are developed. In monocotyledonous (obsolete endogenous) stems the cambium layer is awanting. At the beginning of the second year's growth, and sometimes during the first year, the cambium layer stretches across from bundle to bundle until a hollow cylinder of cambium is formed within the stem (fig. 1, II.). During the second year this cambium cylinder forms a continuous cylinder of wood to the inside and a thinner cylinder of bast to the outside (see fig. 1, II. and III.). The result of this is to push the bast towards the outside of the stem, while the wood forms round the original pith as its centre. (For further development of all the tissues outside of the cambium, see articles Bast and Bark.) In tropical regions where the growth of the cambium is almost continuous the wood is of almost uniform structure or grain, but where the leaves wither or fall during the hot dry season growth ceases, and this stoppage of growth is marked in the wood by an annual ring. Annual rings are best seen in woods grown in temperate regions, and are explained as follows: The cambium is active only from the opening of the bud in spring to the fall of the leaf in autumn; then growth stops and the cambium remains inactive during the winter. The result of this alternate growth and rest is the formation of the well-known rings of wood, seen when a tree is cut across, and by which we can approximately calculate the age of the tree.

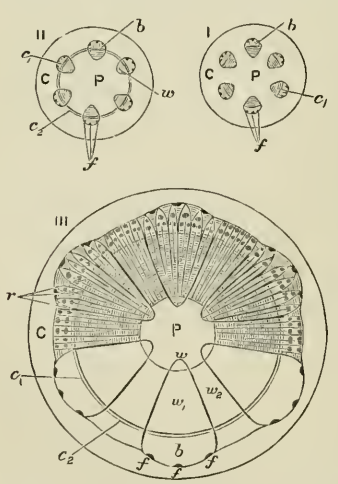

Fig. 1.—Diagram of ordinary growth in thickness, with the development of a compact woody mass. Nos. I., II., III., the same transverse section at different stages in order of age; I., before the formation of the cambium between the bundles; II., after its formation; III., after the cambium has been active for some time: Everywhere, C, cortex; P, pith; *b*, bast; *w*, wood of the vascular bundles; *f, f, f*, three groups of fibres of bast; c_1, cambium of the original bundle: c_2, cambium formed between the bundles; w_1, wood formed from the cambium of the bundle; w_2, wood formed from the cambium between the bundles; *r*, medullary rays. (After Sachs.)

In spring, when growth begins, the bark clothes the stem somewhat loosely; the cambium grows rapidly and forms vessels and cells of large bore and thin walls; but as the new wood grows outwards, and new bast is formed on the inner surface of the bark, the two layers of wood and bast press upon one another; and the pressure often becomes so great that during the summer the outer bark of many young trees may be seen splitting into longitudinal cracks which darken and widen with age. As the summer gives way to autumn the increasing pressure of the wood within the bark forces the cambium to form the vessels and cells of the wood with thicker walls and narrower bores, and the result is a dense close-grained or autumn wood, so valuable in carpentry; while the open ends of the large vessels in the loose-grained spring wood can be seen with the naked eye in a cross section of an oak stem. In the same section light-coloured lines of cells may be seen running from the pith—others from the different rings—outwards to the bast; these are the medullary or pith rays—the silver grain of carpenters.

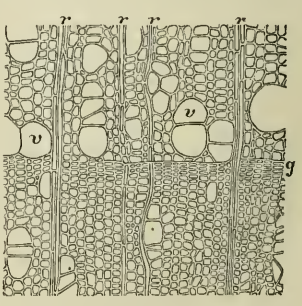

Fig. 2.—Transverse section of the wood of *Rhamnus frangula* (highly magnified): *g*, the autumn wood of an older annual ring; *v*, vessels in the spring wood of a younger ring; *r*, medullary rays. (After Rossman.)

It is through these that the food-sap of the bast soaks to the wood and the pith in the younger stages of the stem, and they also store up food for the stem during winter. When wood is dried too rapidly it

often cracks along the medullary rays, which are made up of cells with thinner walls than the neighbouring wood cells and vessels; consequently the medullary rays are lines of least resistance. If a tree is deprived of its leaves by insects or other agencies during the summer, the formation of wood ceases; but if the tree recovers from the injury and forms new leaves, then new wood resembling spring wood is formed, and this is followed by the usual autumn wood. In such a case a double ring will thus be formed in one year; hence the necessity of accepting with caution the number of rings as the exact age of the tree. The effects of a cold season will be seen in the narrow ring of wood produced, while a warm season will cause the formation of a broad ring. The general breadth of the annual rings increases with the age of the tree up to a certain period, and then begins to decrease. It is seldom that the rings are of uniform breadth round the stem; they are usually broader on the side exposed to the greater light and air; while the lateral branches of most dicotyledons have thicker annual rings on their upper than on their under surfaces, and the branches of conifers have the greater thickness on the under surface. (For explanation of heart-wood—Duramen—and sap-wood—Alburnum—see TIMBER.) The hardness of wood is due to lignin, a substance of unknown composition related to Cellulose (q.v.); hence woody tissues are said to be lignified. See *The Oak* (Modern Science, 1892), and *Timber and some of its Diseases* (1889), by Marshall Ward.—For the preservation of wood from decay, see TIMBER, DRY-ROT; for wood-pulp in paper-making, see PAPER; see also PAVEMENT, SILK.

Wood, or À WOOD, ANTHONY, antiquary, was born at Oxford, 17th December (St Lazarus' Day) 1632. In 1647 he was entered at Merton College as a gentleman-commoner, and became a postmaster; in 1652 he took his bachelor's, in 1655 his master's degree. Being of independent means, he took to no profession, but practised the violin assiduously, and devoted himself to heraldry and antiquarian studies. Lighting on Dugdale's *Antiquities of Warwickshire*, he recognised the work of his life, and thereafter laboured with a more constant assiduity. The fruit of these labours was his *History and Antiquities of the University of Oxford*, his copy of which the delegates of the university press bought for £100, caused it to be translated into Latin, and published as *Historia et Antiquitates Universitatis Oxoniensis* (2 vols. folio, 1674). Wood was very ill satisfied with the translators' work, and made a new copy of his English MS., which was at length published by John Gutch, as I., *The History and Antiquities of the Colleges and Halls in the University of Oxford*, with an appendix containing *Fasti Oxonienses* and Index (2 vols. 4to, 1786–90); II., *The History and Antiquities of the University of Oxford* (2 vols. in 3, 1792–96). He continued to labour on his great work, *Athenæ Oxonienses:* an exact history of all the writers and bishops who have had their education in the university of Oxford from 1500 to 1690, together with the *Fasti* or Annals for the said time (2 vols. folio, 1691–92). In 1693 he was fined in the vice-chancellor's court and banished the university for some libellous remarks therein on the Earl of Clarendon, but was permitted to return after a recantation. He died 28th November 1695.

Other works were *The Ancient and Present State of the City of Oxford* (4to, 1773, which forms a pendant to the earlier of his two great works), and the ill-natured *Modius Salium, a Collection of Pieces of Humour* (1751). Wood himself prepared the materials for a third volume of his *Athenæ*, but did not see it printed. This was included in the second edition printed by Tonson (2 vols. folio, 1721). The third edition, with additions, is that by Philip Bliss (4 vols. 4to, 1813–20); a projected fourth by the same erudite scholar, to be issued by the short-lived Oxford Ecclesiastical History Society, saw only the first volume, containing the Autobiography (1848). This last was edited in 1892 for the Oxford Historical Society by Mr Andrew Clarke, who admirably edited the *Life and Times of Wood*, in 5 vols. (1891, &c.).

Wood, SIR EVELYN, soldier, was born, the son of the Rev. Sir J. P. Wood, at the vicarage of Cressing in Essex, 9th February 1838, and entered the navy in 1852, serving in the Crimea with distinction in the Naval Brigade. He then became a cavalry officer, and as brigade-major was present at several engagements in the Indian Mutiny war, receiving the thanks of the Indian government and the Victoria Cross. As lieutenant-colonel of infantry he was with Wolseley during the Ashantee war. He was called to the bar in 1874, but left the Middle Temple to command a column through the Zulu war, leading the advance as brigadier-general at Ulundi. Created K.C.B. in 1879, he had a share in the Transvaal settlement (1880–81); he received the thanks of parliament for his services in Egypt, became commander-in-chief of the Egyptian army, and at home, after commanding the eastern district and at Aldershot, was made quartermaster-general (1893) and adjutant-general (1897) to the forces. He is V.C., G.C.M.G., and G.C.B., and holds the Medjidieh order, a knighthood of the Legion of Honour, &c.; and he has written on the Crimea in 1854 and 1894, and on *Cavalry at Waterloo* (1896), as well as shorter papers on military subjects. See the Life by Charles Williams (1892).

Wood, MRS HENRY (*née* Ellen Price), born in Worcester, 17th January 1814, daughter of a glove-manufacturer, was married early to Mr Henry Wood, a merchant in France, but settled after his death in London, and commenced writing for *The New Monthly Magazine* and *Bentley's Miscellany*. Her first novel was *Danesbury House* (1860), a prize tale of the Scottish Temperance League, followed by *East Lynne* (1861), which had an almost unexampled success, although in no sense a great story. Having found her public, Mrs Wood poured forth in succession upwards of thirty novels more, perhaps the best being *The Channings* (1862), *The Shadow of Ashlydyat* (1863), *Oswald Cray* (1864), *A Life Secret* (1867), *Dene Hollow* (1871), *Within the Maze* (1872), and *Pomeroy Abbey* (1878). In her novels she contrived to unite plot and melodrama without outraging morality, but her work never rises in quality above the commonplace, and there is ever present a thread of vulgarity. She revealed, however, some power in the analysis of character apart from plot in her anonymous *Johnny Ludlow* stories (1874, 1880). Mrs Wood in 1867 became the proprietor of the *Argosy* magazine, and her novels appeared in it long after her death, on 10th February 1887. See *Memorials* (1895) by her son.

Wood, JOHN GEORGE, popular writer on natural history, was born in London in 1827, and studied at Merton College, Oxford. Till 1862 he held some minor appointments (as chaplain, &c.), but is known as author of a long series of works on Zoology, comprising a smaller and a larger *Natural History* (1852; 18th ed. 1891), *My Feathered Friends*, the *Common Objects* group, *Petland*, *Insects at Home*, *Insects Abroad*, *Man and Beast*, and *The Dominion of Man over Animals* (posthumously published). He died 4th March 1889. See the Life by his son (1890).

Woodbine, a name for the Honeysuckle (q.v.), given also to other climbers, such as some kinds of ivy, the Virginian creeper, &c.

Woodbridge, a market-town and river-port of Suffolk, on the right bank of the Deben, which

expands into an estuary, 12 miles from the sea and 8 ENE. of Ipswich. The *Udebrygge* of Domesday, and the seat of a 12th-century Augustinian friary, it has a fine Perpendicular church with a flint-work tower 108 feet high, a Flemish-looking town-hall, and the richly endowed Seckford almshouses and grammar-school—the former dating from 1587, and rebuilt in 1840 at a cost of £28,000. Bernard Barton and Edward FitzGerald were residents. Vessels of 140 tons can reach the town, which exports corn, malt, and bricks. Pop. 4600.

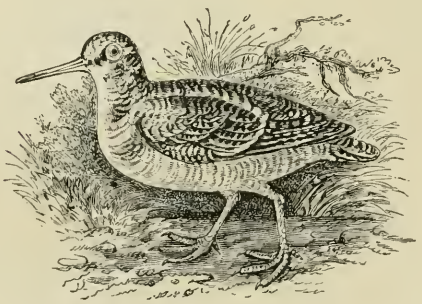
Woodburytype. See PHOTOGRAPHY, p. 152.

Wood-carving. See CARVING.

Woodchat (*Lanius rutilus* or *auriculatus*), a bird which, notwithstanding its name, is not a species of Chat, but of Shrike (q.v.). Its whole length is about 7 inches. The upper parts are mostly black, the under parts white; but there is a white spot on the wing when closed, and other small portions of the wing-feathers are white, as well as the outer tail-feathers, and there is a narrow streak of white above each nostril; the crown of the head and nape of the neck are rich chestnut red. It is a rare bird in Britain, but is abundant in the southern parts of Europe, where it breeds in summer, leaving the southern side of the Sahara for northern Africa in March. In food and habits it resembles other shrikes, only feeding more largely on insects and being fond of bathing.

Woodchuck. See MARMOT.

Woodcock (*Scolopax*), a genus of birds of the family Scolopacidæ, allied to the Snipes (q.v.), but of a more bulky body and with shorter and stronger legs. The Common Woodcock (*S. rusticula*) is comparatively abundant throughout Britain during the winter months, and a small but increasing number remain all the year round. The chief breeding-grounds of the woodcock are the great pine-forests of northern Europe and Asia, but in winter it is found as far south as the shores of the Mediterranean. The nest is formed simply by lining a sheltered hollow with dead leaves, and three or four yellowish eggs with brown markings are laid in March or early in April. The young birds are sometimes carried by the mother from place to place, and the manner of carrying has given rise to much discussion. Mr Charles St John says that



Woodcock (*Scolopax rusticula*).

from close observation he found that 'the old woodcock carries her young, even when larger than a snipe, not in her claws, which seem quite incapable of holding up any weight, but by clasping the little bird tightly between her thighs, and so holding it tight towards her own body.' The woodcock feeds in the early morning and at dusk on worms, beetles, small crustaceans, &c., the quantity of food consumed being very large. Its flesh is much prized, and besides falling to the gun of the sportsman it is caught by nets and snares placed in the 'cock-roads' or tracks made by the birds in going to and returning from their feeding-grounds. The adult bird measures about 14 inches, and weighs less than 1 lb. The general colour of the plumage is a warm ruddy brown with black spots on the upper parts, and yellowish brown with dark bars on the under parts. The American Woodcock (*S. minor*) is a smaller bird than the European species, and it also is in much request for table use. See Howard Saunders' *Manual of British Birds*.

Wood-engraving, or XYLOGRAPHY (Gr. *xylon*, 'wood,' and *graphō*, 'I write'), the art of engraving designs on wood, differs from copper and steel plate engraving by having the parts intended to print on the paper in *relief*. While *plates* are printed from the engraved lines by a laborious and necessarily slow process (see ENGRAVING), wood-engravings, having the object to be represented on the surface, in the manner of a type, may be printed along with the matter they are intended to illustrate in the ordinary printing-machine. This, of course, is an important point in the illustration of books, on the grounds of cheapness and expedition. Another advantage wood-engravings possess is that they can be multiplied to any extent by means of the electrotype process (see ELECTRO-METALLURGY).

The invention of wood-engraving, like that of gunpowder, has been claimed for the Chinese, whose books have certainly been printed from engraved wood-blocks for ages. It has indeed been asserted that the art of cutting figures in relief, and printing impressions of them on paper, was known and practised by that nation as early as the reign of the renowned Emperor Wu-Wang (1120 B.C.). There is no doubt that wood-stamps were used by the ancient Egyptians and Romans for stamping bricks and other articles of clay; and that wood and metal stamps of monograms, &c.,

Fig. 1.

were used in various European countries, for attesting deeds and other documents, at a very early period, when the ability to write was an extraordinary accomplishment even for princes. It is not, however, until the beginning of the 15th century that we find any evidence of the existence of

wood-engraving, as we now understand it. It appears to have been used in Germany at that time for printing playing-cards and figures of saints. The earliest print of which any certain information can be obtained was discovered in one of the most ancient convents of Germany—the Chartreuse of Buxheim, near Memmingen in Bavaria—pasted within the cover of a Latin MS.; it represents St Christopher carrying the infant Saviour across the ferry, and is dated 1423. Fig. 1 is a reduced fac-simile of this curious engraving. It is a work of some merit, notwithstanding its apparent roughness; the infant Saviour and the drapery of the saint being drawn with considerable skill and vigour. The Latin inscription at the bottom may be thus translated: 'In whichever day thou seest the likeness of Christopher, in that same day thou wilt, forsooth, die no evil death.—1423.' Shortly afterwards a series of books, printed entirely from wood-engravings, called block-books, were issued. They consisted principally of religious subjects, with short descriptions engraved on the same block. The most important of them were the *Apocalypsis, seu Historia Sancti Johannis;* the *Historia Virginis ex Cantico Canticorum;* and the *Biblia Pauperum* (q.v.). The illustrations, of which Mr Jackson in his treatise on the *History and Practice of Wood-engraving* gives an elaborate account and several specimens, seem to be drawn with a supreme contempt for perspective and proportion, but bear evidence of the draperies, and hands and faces, having been carefully studied. Fig. 2 is a copy of one of the engravings in the *Apocalypsis.* It represents St John preaching to three men and a woman, with the inscription: '*Conversi ab*

Fig. 2.

idolis, per predicationem beati Johannis, Drusiana et ceteri' (By the preaching of St John, Drusiana and others are converted from their idols). Fig. 3, from the *Biblia Pauperum,* is curious as showing the general manner of representing the creation of Eve during the 15th century, the same subject frequently occurring previous to 1500. Both have the appearance of careful drawings rather roughly engraved. Previous to the invention of movable types whole books of text were also engraved on wood, and the impressions had evidently been taken by *rubbing* on the back of the paper, instead of steady pressure, as in the printing-press, the ink used being some kind of distemper colour.

The Psalter printed by Fust and Schöffer at Mainz in 1457 is illustrated with initial letters engraved on wood, and printed in two colours, blue and red, which Mr Jackson considers 'the most beautiful specimens of this kind of ornament which the united efforts of the wood-engraver and the pressman have produced. They have been imitated in modern times, but not excelled.' It is worthy of note that, although printed upwards of 400 years ago, the freshness and purity of the colours remain unimpaired.

Fig. 3.

As printing spread, the publication of illustrated books became general in Germany and Italy, and reached England in 1476; in which year Caxton (q.v.) published the second edition of the *Game and Playe of the Chesse,* with figures of the different pieces. They are very rude compared with the earlier German works. Fig. 4 is a reduced copy of the 'Knight,' and is interesting as one of the first wood-engravings executed in England. Several works followed, all, however, executed in the same rude manner. The first attempt at something finer than simple lines appears in the frontispiece to the Latin edition of Breydenbach's *Travels,* printed at Mainz by Erhard Reuwich, 1486. It is by an unknown artist, and is an elaborate and really very beautiful specimen of the art. It is also remarkable as being the first engraving introducing *cross-hatching* to represent dark shadows. The *Hypnerotomachia Poliphili,* printed at Venice by Aldus in 1499, is worthy of mention for the extreme beauty of the designs, which have been ascribed by some authorities to Raphael, and by others to Mantegna. About the beginning of the 16th century a complete revolution in the art of wood engraving was accomplished by the genius of Albert Dürer. His productions exhibit not only correct drawing, but a knowledge of composition and light and shade, and attention to the rules of perspective, which, with the judicious introduction of subordinate objects, elevated them to the rank of finished pictures. Dürer, however, in common with most of the German artists of his day, paid very little attention to the propriety of costume in his religious subjects; one of his drawings in the *History of the Virgin* (1511), for instance, representing the birth of the Virgin, shows the interior of a German burgomaster's house of his own day, with a number of gossips drinking from flagons and otherwise enjoying themselves. There has been considerable discussion as to the probability of Dürer having also *engraved* his drawings. Most of the best authorities on the subject, including Bartsch, Jackson, and Firmin Didot, agree in the negative. Mr Jackson, who speaks with the experience of a practical engraver, says: 'In most of the woodcuts supposed to have been engraved by Albert Dürer we find cross-hatching freely introduced: the readiest mode of producing effect to an artist drawing on wood with a pen or a black-lead pencil, but which to the wood-engraver is attended with considerable labour. Had Albert Dürer engraved his own designs I am inclined to

think that he would have endeavoured to attain his object by means which were easier of execution.' The reader is referred to the article DÜRER

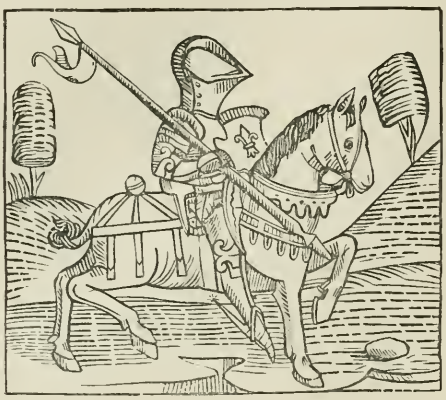


Fig. 4.

for an account of some of his numerous works. The best of Dürer's contemporary artists on wood were the painters Hans Burgkmair (q.v.), Lucas Cranach (q.v.), and Hans Schäufflein. A series of works projected by the Emperor Maximilian were illustrated by these artists; but they are not equal to those of Dürer.

During the first half of the 16th century the publication of books illustrated with wood-engravings still increased, and prevailed to a greater extent than at any other time, with the exception of the present day. The superiority of talent, both in drawing and engraving, however, still remained with the Germans. In France, although their figure-subjects were inferior to those of their German neighbours, their ornamental borders in prayer-books, &c., of which a great number were printed at this time, were extremely beautiful. In Italy and England the art was very far behind. The most remarkable work published at this time was the *Dance of Death* (q.v.), issued at Lyons in 1538. The original edition of this curious work contained forty-one engravings, representing the struggle between Death, generally in the form of a skeleton, and different individuals, such as the Pope, the Emperor, a Judge, Monk, Doctor, Duchess, Old Man, &c. The drawings, which are characterised by great vigour and skill, are generally understood to have been executed by Hans Holbein (q.v.); but whether he also engraved them, as has been alleged, is more than doubtful. Towards the conclusion of the century, however, the art had made considerable progress in Italy, where some of the best productions of Germany were equalled, if not excelled. In England it did not make much progress. John Daye published almost the only illustrated books of the time, notably Queen Elizabeth's Prayer-book, which contains a tolerably well executed portrait of Her Majesty. There is no certain knowledge about any of the artists or engravers, although John Daye is supposed to have engraved some of his blocks himself. At this time also the practice of printing wood-engravings in colours from different blocks became somewhat common, although the attention of artists in that line was mostly confined to ornamental subjects. From the beginning of the 17th century the decline of wood-engraving may be dated, Germany, the cradle of the art, being the first to forsake it; the only works worthy of notice were a series of blocks on various subjects—designed by Rubens, and engraved by Christopher Jegher of Antwerp, one of the best wood-engravers of that period—some of which are of great beauty. From this time the art fell into a state of great neglect, not apparently for want of engravers, for woodcuts of a certain kind were always produced, but for want of artists able or willing to make drawings worthy of preservation.

Nothing particularly deserving of notice occurred until 1766, when John Michael Papillon, an enthusiastic professor of the art in France, published an elaborate history of the subject in an unsuccessful attempt to restore it to its former importance. But it was not until the genius of Thomas Bewick (q.v.) was brought to bear on it that wood-engraving received that impetus which has made it what it now is—one of the most important of the illustrative arts. Bewick's most important works are his *History of British Quadrupeds* (1790) and of *British Birds* (1804); all the quadrupeds and almost all the birds were drawn and engraved by himself. The birds especially are executed with a truthfulness and skill which has rarely if ever been equalled. These works are also famous for their collection of tailpieces, which display an infinite amount of humour and pathos. Fig. 5 is a reduced copy of one of them—a poor ewe, in the starvation of winter, picking at an old broom in front of a ruined cot—a scene, trifling as it seems, which tells a woeful tale of suffering. He entirely abandoned the elaborate system of 'cross-hatching' which prevailed so much

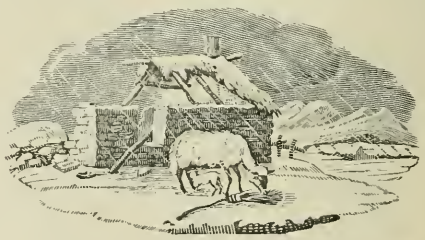

Fig. 5.

in the works of the older engravers, and produced his light and shade by the simplest possible means. The above example affords an excellent specimen of a wonderful effect being produced by a few simple lines.

Since Bewick's time wood-engraving has continued to flourish without interruption. He left behind him several pupils, the most successful of whom were Nesbet, Clennell (who engraved some of the tailpieces in the *British Birds*), and William Harvey. Harvey, however, forsook the burin for the pencil; and his drawings illustrating Milton's *Paradise Lost*, Thomson's *Seasons*, &c., especially such as were engraved by John Thomson (perhaps the most skilful engraver that ever lived, and a pupil of Robert Branston, a self-taught engraver), still retain a first-class place as specimens of wood-engraving. The establishment of the *Illustrated London News* (1842) tended greatly to familiarise the public with the beauties of wood-engraving. In the pages of that periodical appeared the first drawings on wood of (Sir) John Gilbert and Birket Foster. The spirited figure-subjects of the former and the exquisite landscapes of the latter did much to raise the art to the very high place it now occupies in England.

The closing quarter of the 19th century has been an important period in the history of wood-engraving, from the rise of what has been called the American school, which has had a considerable effect and many followers in England. It is typified in many of the finer illustrated magazines published in the

United States and England, and much of their work is very beautiful.

At first their tendency was to use the burin to imitate something else, such as chalk or pencil drawings, which they certainly did with great fidelity; but this could scarcely be called the proper province of wood-engraving. W. J. Linton (q.v.), the veteran wood-engraver, in several works rated them soundly for what he considered their mistaken notions, and advocated a simpler style of line, such as used by himself with masterly skill. Though his advice was ridiculed, an undoubted change in this direction gradually took place, and as specimens of pure wood-engraving much of the more recent work is as near perfection as we may expect to see it. The professors of the arts of drawing and engraving on wood in the present day are so numerous, and their works generally so well known, that it would be needless, even if our space permitted, to attempt even to enumerate them.

Practice of Wood-engraving.—The wood used for engraving is boxwood, which has the closest grain of any wood hitherto discovered. It is principally imported from Turkey for the purpose, as the English box is too small to be of much use. It is cut *across* the grain in slices, which are dressed to the same height as type for convenience in printing. Inferior kinds of wood, such as American rock maple, pear-tree, plane-tree, &c., are used for coarser purposes; and for very large and coarse subjects, such as posting-bills, common deal is used, and cut on the *side* of the wood with chisels and gouges. When *blocks*—as the pieces of wood are termed—are required of a larger size than a few inches square it is necessary to join two or more pieces together, as the amount of *sound* wood to be got out of even a large slice is extremely limited. There is, however, for all practical purposes no limit to the joining process, as blocks have been printed consisting of from 50 to 100 pieces. The wood having been made very smooth on the surface, and squared to the required size, the surface may be prepared with water-colour Chinese-white, and the subject to be engraved drawn upon it in the usual way with brush and pencil; or it may be photographed on the wood from a drawing made on paper (see PHOTOGRAPHY, p. 153). The latter method has many advantages, and is almost universally employed. The drawing is not destroyed in the process as if executed on the wood, but can be used to refer to, in touching up the engraving, and it may be sold separately if of value. When the block is prepared with the drawing, or photograph, it is given to the engraver, who, previous to commencing, carefully covers it with paper, fastened round the edges with beeswax; this is necessary, to avoid rubbing the drawing out in the process. As the engraving proceeds he gradually tears the paper off.

The tools or gravers necessary in wood-engraving are of many varieties, from those with fine points to cut fine lines, ranging through all sizes up to small chisels to cut out the wide white pieces. Fig. 6 represents the method of using the graver. Most engravers use a glass of slight magnifying power, more for the purpose of relieving the eyes from the strain of fixing both eyes closely on a small object than for magnifying the work. When gas or other artificial light is used a glass globe filled with water, slightly tinted with blue (to neutralise the reddish glare of the light), is placed between the flame and the work: this serves the double purpose of concentrating the light on the block and keeping it out of the eyes. When the drawing is in outline, or mostly so, the engraving is very simple; the process consists of engraving a line along each side of the pencil lines, which are, of course, to be left in relief, and afterwards cutting out the pieces between. It will thus be understood that every part of a woodcut which prints on the paper

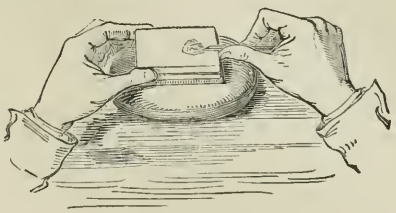

Fig. 6.

is the surface of the wood left untouched, and that every white part is cut or hollowed out. Fig. 7 represents a little subject *outlined;* fig. 8 is the same subject *finished.* When it is complicated with much shading, trees, &c., it becomes much more difficult, and brings into play the artistic talents of the engraver to preserve the proper shades, or *colour*, as it is technically termed, and texture of the different objects, the most skill being required where the drawing has been executed entirely or mostly by brush-work, and the execution is left entirely to the engraver. By a judicious

Fig. 7.

Fig. 8.

use of his various tools, cutting out or leaving the lines thicker or thinner, marvellous effects may be produced by very simple means. Some of the finer portraits entirely engraved from photographs from life, which may be seen in many of the better-class magazines, are wonderful instances of this skill, and are worthy of careful study.

When the drawing is all engraved, a proof is taken by inking the surface gently with printing-ink on a dabber (a ball of cotton covered with silk or leather), and, a piece of *India-paper* being laid on it, by rubbing the paper with an instrument called a *burnisher* until it is all printed, or, where the block is large, printed in a small press. The engraver then sees what touching up it requires before it is finished and ready for the printer.

When large blocks are to be engraved the pieces of wood are joined with screw-bolts, and the drawing prepared in the usual manner; after which the pieces can be taken separate for convenience in engraving, and also for the purpose of getting it quicker finished by having an engraver working at each piece—a matter of some consequence in many cases, as, for example, in the large engravings in the illustrated newspapers.

For mechanical processes of reproducing drawings, see ILLUSTRATION OF BOOKS. See also ENGRAVING, PHOTOGRAPHY, PRINTING, &c. See Hamerton's *Graphic Arts* (1882); Woodberry's *History of Wood-engraving* (1883); Marx's *Wood-engraving* (1881); Linton's *Wood-engraving in America* (1882); Jackson and Chatto's *History*

and Practice of Wood-engraving (new ed. 1861); Papillon's *Traité de la Gravure en Bois* (1766); Bartsch's *Peintre-graveur;* Ottley's *Inquiry into the History of Engraving on Copper and Wood;* Firmin Didot, *Essai sur l'Histoire de la Gravure sur Bois* (1863); and W. J. Linton, *The Masters of Wood-engraving* (1891).

Wood-evil. See CONSTIPATION.

Woodhouselee. See TYTLER.

Wood-ibis. See TANTALUS.

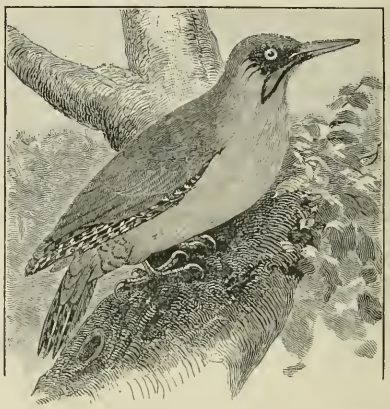
Wood-lice (*Oniscidæ*), a family of terrestrial Crustaceans included in the order Isopoda. The body is more or less oval in outline and flattened; the head bears a long pair of antennæ, another rudimentary pair, a pair of lateral eyes, and jaws; the thorax bears seven pairs of walking legs; the abdomen has six pairs, of which the first five overlap like tiles, and the most anterior are modified to contain air. All live on land, in more or less damp places, hiding during the day, seeking their food in the darkness. The reproductive processes are very complex. When the female is impregnated in spring, she receives the male elements in two sperm-sacs; these burst into the closed oviducts; a moulting takes place, and a genital aperture is formed on the body-wall; the fertilised ova burst from the oviducts into the body-cavity, and pass out by the genital slit into brood-chambers on the legs; when the hatched young leave the brood-chamber another set of ova are squeezed into it; after all is over the female moults again and acquires its original characteristics. About 18 genera and 250 species are known—e.g. *Oniscus murarius* (known in Scotland as *Slater*), common under stones; *Porcellio scaber*, equally common; *Armadillidium vulgare*, able to roll itself up into a ball; *Ligidium personii*, frequent among damp moss and rotten wood; *Ligia oceanica*, on rocky shores. The wood-lice are vegetarian animals, eating both fresh and decaying plants, and some do harm in gardens.

Wood-louse (*Oniscus murarius*).

Wood-naphtha. See PYROXYLIC SPIRIT.

Wood-oil. See GURJUN BALSAM.

Woodpecker (*Picidæ*), a family of birds in the order Picariæ, remarkable for the structural modification of the skull in adaptation to its use as an axe, and for the long, flexible tongue, which is used for extracting insects from holes and crevices of trees. The family embraces at least 250 species, which are most numerous in South America and the Oriental region, less abundant in Africa and North America, and altogether absent from Australia. The members of the typical sub-family Picinæ have stiff tail-feathers; the bill moderately long, broad at the base, hard and pointed at the tip; the toes in pairs, two in front and two behind, with strong, sharp, hooked claws; the tongue capable of being protruded far beyond the bill, and furnished at the tip with horny, barbed filaments. The food consists for the most part of timber-haunting insects, and it is in the effort to discover and dislodge these that the characteristic tapping sound is made. But the woodpecker does not confine itself entirely to trees; it feeds occasionally on ground-insects, and some species are known to eat nuts and berries. The nest is simply a hole pecked out in a tree, such as the beech, of which the wood is comparatively soft, and no lining, except a few chips, is placed inside. Only three species of woodpecker occur in Britain, and none of these is very abundant except in a few localities. The best known is the Green Woodpecker (*Gecinus* or *Picus viridis*), often called the Yaffle, Woodweele, or Rainbird—the last name referring to its most frequent note, 'a loud, laughing *pleu, pleu, pleu*, popularly supposed to foretell rain.' This species is found in wooded districts in England; it is rare in Scotland, and almost unknown



The Green Woodpecker (*Gecinus* or *Picus viridis*).

in Ireland. The adult bird measures 12 inches; the prevailing colour of the plumage is green—dark olive on the upper, pale green on the under parts; the crown and back of the head are bright crimson. The Great Spotted Woodpecker (*Dendrocopus major*) and the Lesser Spotted Woodpecker (*D. minor*) are chiefly confined to the southern and midland counties of England. The former species is about 9 inches in length, the latter only 5; in both the prevailing colours of the plumage are black and white, the male having crimson markings about the head.

Of the numerous American species the Flickers (Colaptes), the South American Ground-flickers (Soroplex), which live chiefly on termites, and the Great Ivory-billed Woodpecker (*Campephilus principalis*) may be specially noted. The last-named species, which inhabits the dense forests of the southern states, is one of the handsomest of the group, and was called by Linnæus the Prince of Woodpeckers, but as it is nowhere abundant, and is very wary, comparatively little is known of its habits. The Piculets (Picumninæ) form a distinct sub-family. They are very small, and the tail is short and not stiffened. About twenty species occur in South America and several in the Oriental region. As far as is known their habits resemble those of the woodpeckers proper. Also allied are the wrynecks (Jynx), which are restricted to the Old World.

It has been much discussed whether woodpeckers are injurious or not, but no general statement can be made, their habits varying with the species, the country, and the season. They are blamed for attacking trees, stealing seeds and fruits, and eating useful insects, such as most ants; but the trees they attack are usually not sound, and they destroy enormous numbers of injurious insects.

In Roman mythology Picus was supposed to have been turned into a woodpecker by Circe because of his love for Pomona.

Wood-preserving. See TIMBER.

Woodruff (*Asperula*), a genus of plants of the natural order Rubiaceæ, containing a number of annual and perennial species, with whorled leaves, natives of the northern parts of the Old World, and distinguished by a funnel-shaped or

bell-shaped corolla, a bifid style, capitate stigma, and dry didymous fruit. The Sweet Woodruff (*A. odorata*) is common in shady woods in Britain and all parts of Europe. It has a creeping root, a stem 5 to 10 inches long, weak and sub-erect, four or five whorls of lanceolate leaves, six to eight in the whorl, rough at the edge and keel, and small white flowers. The plant, when dried, has a very agreeable fragrance, similar to that of *Anthoxanthum odoratum* (see VERNAL GRASS) under similar circumstances. It forms an agreeable herb-tea, and enters into the composition of the popular *May-drink* of the Germans. —Dyer's Woodruff (*A. tinctoria*) is a native of the continent of Europe and of Siberia, a perennial, with reclining stems about a foot in length, whorls of six or four linear leaves, the upper leaves opposite, the flowers whitish. The root is used in Dalmatia and elsewhere instead of madder; but the crop obtained from a field is inferior in quantity to madder.

Sweet Woodruff (*Asperula odoratam*).

Woods and Forests. In ancient times the principal part of the royal revenues of England consisted of the rents and profits of the crown-lands, which were composed of numerous lordships and honours, with forests and chases. The demesne lands reserved to the crown at the Conquest were at one time very extensive; but while they were often added to by forfeitures, they were also so largely encroached on by grants to subjects that from the 12th to the 14th century parliament had often to interpose to compel the resumption of grants thus made. The confiscation of the property of the monasteries under Henry VIII. greatly increased the real estate of the crown; and, notwithstanding alienations by that monarch, and by Queen Elizabeth, who disposed of part of the royal domains to avoid application to parliament for supplies, the crown at the accession of James VI. owned very extensive estates all over England. The profusion, however, of James and his successors reduced the royal estates to insignificance, and no effectual restraint was imposed on their dilapidation until statute 1 Anne, chap. 1, prohibiting all alienations of the crown-lands, except by leases not exceeding thirty-one years, or three lives. From the reign of Henry VIII. to that of George III. the crown revenues were subjected to repeated changes of management; and under George III. the system was first introduced of surrendering the greater part of them to be consolidated with the rest of the public revenue, out of which the royal civil list is paid. The modern administration of the land revenues of the crown is founded on a statute of 1810, establishing a Board of not less than two or more than three Commissioners, called 'The Commissioners of His Majesty's Woods, Forests, and Land Revenues.' The law relating to the management of the crown-lands was consolidated by an act of 1810, which, repealing a number of previous enactments on the subject, placed the whole hereditaments of the crown in England, Wales, and Ireland, except advowsons and vicarages, under the management of the Commissioners of Woods and Forests, with large power of selling and leasing them; and provided that the annual land revenues should, subject to certain deductions, be carried to the Consolidated Fund during the king's life. This transfer to the Consolidated Fund, the result of a special agreement terminating with the life of the sovereign, has been renewed with his successors. In 1832 the Treasury was empowered to transfer to the Commissioners of Woods and Forests the management of the crown-lands of Scotland. In the same year parliament abolished the office of Surveyor-general of His Majesty's Public Works and Buildings, and entrusted to the commissioners the management of the public works. This union, however, was afterwards considered inexpedient, and in 1851 the department of Public Works was placed under separate control. An act of 1866 introduced various alterations in the details of management. The Commissioners of Woods and Forests act under the control of the Treasury, and are required to transmit annual accounts of the receipt and expenditure of their department, to be audited by the Commissioners for auditing Public Accounts. The net yearly receipts from this source amount to about £430,000. See WORKS (BOARD OF).

Wood's Halfpence, a copper coinage for Ireland granted by the English ministry in 1722 to William Wood. He was to share the profit from the difference between the nominal and the intrinsic or bullion value of the coins with the king's mistress, the Duchess of Kendal, who had secured the patent for Wood. Against the whole transaction the *Drapier's Letters* of Swift (q.v.) raised such public indignation that the patent was cancelled, and Wood compensated by a pension.

Wood-sorrel. See OXALIDEÆ.

Wood-spirit. See PYROXYLIC SPIRIT.

Woodstock, a market-town of Oxfordshire, on the Glyme, 8 miles NNW. of Oxford. It was a royal manor from Saxon times until 1705, when it was granted to the Duke of Marlborough, whose seat, Blenheim Park (q.v.), is close by. Hence it has many memories, as the birthplace of the Black Prince (though not of Chaucer), as the scene of Becket's first quarrel with Henry (if not of Fair Rosamond's murder), as the place of captivity where Elizabeth wished herself a milkmaid, and for the pranks of its 'merry devil' on the parliamentary commissioners in the old manor house, which was pulled down in 1723. A municipal borough, chartered first by Henry VI., and last in 1886, Woodstock till 1832 returned two members to parliament, and then till 1885 one. It still carries on leather glove-making. Pop. 1628. See E. Marshall's *Early History of Woodstock Manor* (2 vols. 1873–74).

Woodstock, a port of entry and capital of Oxford county, Ontario, on the Thames, 88 miles by rail SW. of Toronto, with a Baptist seminary and considerable trade. Pop. 5373.

Wood-swallow, an Australian name for any of the fly-catching Artamidæ, also called Swallow-shrike—the resemblance to shrikes being considerably closer than to swallows either in appearance or habits.

Wookey Hole, a cave near Wells, Somerset, situated in dolomitic conglomerate. When discovered it was filled to the roof with debris, in which were found bones smashed and splintered and scored with tooth-marks of the hyæna, whose remains largely preponderated. The cave appears to have been a hyæna's den. Amongst other species represented were horse, rhinoceros, deer, bear, ox, mammoth, lion, fox, wolf, and lemming. Man's presence was shown by the occurrence of Palæolithic flint-implements.

Wool. From the earliest historic times wool has been used in the construction of yarns or threads, which by the process of weaving—i.e. the act of interlacing two series of yarns crossing each other at right angles—have been converted into textiles possessing clothing properties. With the progress of civilisation and the development of the *beaux arts* wool became the staple material of many of the costly and elaborately-ornamented textures produced conjointly by the weaver and the embroiderer for embellishing the temples of the gods and the palaces of royalty. The collections of Egyptian and Persian fabrics in the Musée d'Art et d'Industrie at Lyons and in the British Museum, dating back to the 4th century of the Christian era, contain various woven specimens of decorative and other textiles, in which wool is the principal fibre, and whose individual threads are spun to such a degree of fineness or extennation as to bespeak considerable skill in the manipulation of this material. According to Herodotus the tunics of the Babylonians were composed of woollen yarns; Homer refers to Thrace as 'the mother of flocks;' and Plato mentions the working of wool by the crossing of threads, thereby producing a tissue. As to the Romans there are many facts extant which indicate that they understood the whole art of wool manufacture as manually performed. In the ruins of Pompeii there is a complete plant of scouring, fulling, and pressing apparatus, and though it is of an extremely primitive character, still it shows that centuries ago these sections of cloth manufacture formed a specific art, and also that the felting property of wool, which distinguishes it from all other fibres, whether of an animal or of a vegetable character, was then taken advantage of in the construction of 'wool' as distinct from linen and cotton fabrics. During the period that Britain was a colony of Rome a woollen factory was established at Winchester. Although it is highly probable that the ancient Britons before the invasion of the Romans were familiar in a rude fashion with the handicrafts of spinning and weaving (it is recorded that Boadicea wore a tunic checked with a variety of colours, presumably of British manufacture), yet this Roman factory must have been instrumental in placing the weaver's art on a more efficient basis than hitherto.

Not only were the ancients acquainted with the scheme of manufacturing fabrics by weaving threads together composed of wool, but they also made, by pounding the fleece of filaments in a damp condition, a species of *felt*. Pliny accredits the Gauls with carrying on this kind of wool manufacture, stating that they produced a cloth without spinning or weaving. This must have been obtained by submitting the wool to similar chemical and mechanical conditions as are attained in the manufacture of *felts* for hats, carpets, and shoes in modern times; for the felting or fulling of wool (see below) can only be acquired by adopting a certain routine as to moisture, pressure, and temperature. It seems probable that succeeding the use of the skin of the sheep as a covering or wrap would be this type of cloth, for it is far more easily produced than the more complex texture yielded by the loom. In its construction only one process, and that an extremely simple one to perform, is necessary, whereas to make a woven fabric the wool has to be carded, spun, prepared for weaving by warping, beaming, healding, and sleying, and, lastly, formed into a texture by interlacing shoot after shoot of weft with a limited number of threads of warp. But it may be supposed that the readiness with which wool can be made to assume a weavable thread would at an early period in the history of woven manufacture suggest it to the ingenious craftsman as suitable material for textile purposes.

In the middle ages, when Flanders was the great headquarters of manufactures in wool, English wools were held in great esteem, and, in spite of frequent laws, especially from the time of Edward III., to prevent exportation, were largely purchased by the textile producers of that country. The wool-workers and weavers of Ghent and Bruges asserted themselves in war and politics against Burgundy and France. At various dates Flemish wool-workers settled in England, and taught the English, as they also taught the French, the art they had carried to so great perfection. The remarkable enactment of Charles II., that every Englishman should be buried in a woollen shroud, which was in force from 1678 till 1815, contributed in a measure to the growth of woollen manufacturing as a great native industry. Wool-working in factories and on a commercial scale was not established in the United States till about the end of the 18th century.

The accelerated development of the textile industry, especially during the 19th century, has resulted in an enormous increase in the growth of wool. Up to 1850 the wools used in Britain in the manufacture of woollen and worsted fabrics, in addition to those of home growth, were chiefly imported from Spain and Germany. Now the principal wool-growing countries are as follows: Australia, New Zealand, Tasmania, Cape Colony, South America, and India. Of course England, Scotland, France, Germany, Spain, and Russia all produce limited quantities of wool; but, with the exception of small portions of Saxony and Silesian wools that are used in the west of England in the manufacture of the finest doeskins and kerseymeres, British textile producers are dependent chiefly upon the colonies of Australia, New Zealand, Tasmania, and the Cape for their wool-supply. The wools of England are not without their uses. Those of Southdown, possessing a fine fibre, and, as compared with the merinos of Australia, a small degree of felting property, are highly suitable for flannels, and are therefore largely purchased by the manufacturers of these goods; Lincoln and Leicester wools, on account of their lustrous qualities, are employed in the dress and mantling trades; and the strong, useful wool grown on the Cheviot Hills is utilised in the manufacture of that extensive class of fabrics known as 'cheviots.'

In mechanical structure the wool fibre is cylindrical in shape, being composed of an infinite number of minute cells. The central part or core of the fibre is ensheathed (*a*, fig. 1) with numerous

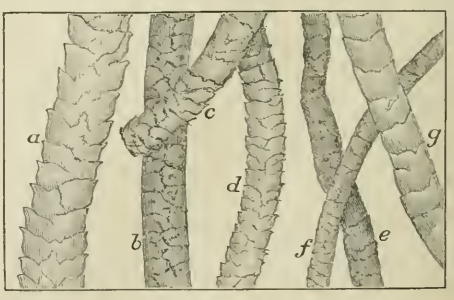

Fig 1.

a, typical wool fibres; *b*, mohair; *c*, 'kempy' fibre; *d*, merino wool; *e*, shoddy; *f*, cashmere; *g*, Lincoln wool.

scales or thin plates more or less funnel-like in shape, and one overlapping the other. Wool is frequently defined as a species of hair, but it differs from this filament in possessing a more fully-

developed serrated circumference, and an increased degree of flexibility, waviness, and elasticity. Even these features of dissimilarity are obvious when wool and mohair (the product of the Angora goat) are compared. Fibres *a* and *b* in fig. 1 show the difference in external structure. In *a*, which is a typical wool fibre, the scales are clearly defined, appear in some cases to encircle the filament, and fit one into the other; but in *b* these serrations are less prominent, and the fibre is straighter, and therefore comparatively deficient in waviness. Cashmere, a fine, downy material yielded by the Tibetan goat (*f*, fig. 1), also lacks that well-defined structure which characterises true wool. Microscopically they possess a similar but far from an identical formation, and in the actual work of manufacture the difference between these several fibres is emphasised at every stage of procedure, resulting in the construction of fabrics of distinct qualities, and each used for a specific purpose.

On examining the wool fibre more minutely it is found to consist of three principal parts: (1) the outer scales; (2) the inner bark or cortical substance; and (3) the medullary or central portion. The external scales may be defined as flattened horny cells. They form the sheath or bark of the fibre. Their dimensions, uniformity, soundness, and compactness determine the lustre, firmness, and strength of the wool. The felting or fulling power is also primarily due to their presence in the fibre, being high or low in proportion to their multiplicity and strength. These marginal scales are the most numerous in fine wools, and, as indicated in relation to wool, mohair, and cashmere, differ so largely in formation and arrangement in different types of wools to make it feasible in some instances to distinguish the variety of fibre examined by its serrated surface. The interior of the filament is composed of spindle-shaped cells. Upon the density of these cells—which form the largest proportion of the fibre—the elasticity and trueness of the wool depend. Moreover this part of the fibre is said to possess greater affinity for colouring agents than the external scales, a fact which is proved by the readiness with which 'extract' wools—materials which have been recovered from woven fabrics composed of cotton and wool, by steeping the textures in a bath of diluted sulphuric acid, which destroys the vegetable fibre and leaves the animal fibre intact—can be dyed, and such extracted wools have these interior cells exposed to a considerable degree. The third or medullary part of the wool filament consists of several layers of oval cells which form the pith or core of the fibre. Occasionally these run the entire length of the hair, but they may only occur at intervals. Their functions in the structure of the fibre have not been fully determined.

Fig. 2.—A lock of merino lamb's wool, showing the wavy character of the fibre.

When selecting wool for manufacturing purposes regard is paid to its strength, length, soundness, and elasticity of staple, fineness of hair, and lustrous and felting properties. By 'staple' is meant a lock or strand of fibres (fig. 2). Its several qualities are determined by the touch. An indication of soundness is uniformity of growth in the several filaments of which the staple is composed. Fibres with the greatest diameter will necessarily sustain the most tension, but the tenacity of a sample of wool is not judged by the thickness of individual hairs, but by the strength of the lock. If the fibres are considered separately, Lincoln wool, in point of strength, is far superior to Australian merino, as its breaking strain, according to Bowman, is 502 grains, while the Australian is 50 grains; but it is possible to acquire from the latter wool a cloth capable of sustaining greater strain and friction than can be obtained from the Lincoln. This is partially due to the fact that the merino is ranker in growth, the staple being more compact, and also to the superior felting power of this wool, a quality which imparts increased wearing strength to woollen fabrics.

Elasticity of staple is the power the wool possesses to assume its normal condition immediately on pressure being removed. A quantity of cotton when unpacked lies comparatively solid, but on unpacking a bale of wool it rebounds and expands. This elastic or flexible property is present in the largest measure in wools of a crimpled, wavy form (fig. 2); and, generally speaking, the finer the wool the more fully does this curliness of fibre obtain. Merino wools, for example, contain a large number of curves in a given length of hair, and are remarkable for elasticity and density of staple. Fullness and 'kindness' to the feel, and warmth and comfort in the wear are some of the qualities which the finished cloth derives from this primary property of a good clothing wool.

Lustre of fibre is essential in making certain classes of worsted yarns, and dress and mantle fabrics. Lincoln and Leicester wools are celebrated for their lustrous or shiny appearance. They are only excelled in this particular by mohair and alpaca. Straightness of fibre in combination with an outer sheath of serrations, characterised by a high degree of uniformity and regularity in the size of the individual scales, give to these materials their lustrous quality. Fineness of hair is most important in making fine yarns. A thick-fibred wool will not spin to a great length, and cannot therefore be used in the manufacture of superfine cloths. It may be utilised in medium-class fabrics, but it does not form the requisite smallness of hair to be spun into high counts of yarns which alone can be used in the production of textures fine in structure or containing a large number of threads to the inch.

Wool Substitutes.—The principal substitutes for wool used in making so-called woollen fabrics are noils, mungo, shoddy, extract, and flocks. Formerly mungo, shoddy, and extract were regarded purely as waste and unusable products. Now they are the chief materials employed to cheapen textiles. *Noils* are the curly neppy filaments rejected in preparing wool for worsted yarns by combing. They are pure wool, and are a valuable material. *Mungo* is a product obtained by grinding up tailors' clippings and cast-off garments from which all cotton threads have been extracted. The only difference between *mungo* and *shoddy* (*c*, fig. 1) consists in the latter being the result of treating soft rags, such as blankets, stockings, and comforters. Both are important materials and are extensively used by the manufacturers of Dewsbury, Batley, Guiseley, and Yeadon. *Flocks* are the fibre which leaves the pieces during scouring and milling. A few decades ago they were in large demand, but owing to the introduction of other and cheaper substitutes, changes in fashion, and the decline in the quality of all-wool fabrics they do not now occupy the same prominent place in the materials at the command of the woollen manufacturer as formerly.

Woollen Cloth Manufacture.—When the wool arrives at the factory it is in the fleece or

unsorted condition, and is a promiscuous blend of all kinds of fibres, such as fine and coarse, strong and tender. A single fleece may contain as many as thirteen or fourteen sorts, but in practice it is not generally necessary to make more than five or seven qualities. The choicest wools are derived from the sides and shoulders of the animal, and the inferior classes from the head, the throat, and the shins. A good wool, though not so fine in the fibre and soft to the touch as that grown on the sides, is found on the lower part of the back. Sound intermediate qualities are obtained from the rest of the back and the loins. The wool on the belly is short, dirty, poor in quality and frequently tender, while that coming off the lower parts of the legs is usually burry and possesses a thick fibre and a staple deficient in waviness and elasticity.

The sorter commences the operation of sorting by ascertaining if the fleece in hand is that of a *hog* or *hogget*, or that of a *wether*. The former is *lamb's* or *yearling's*, and the latter *fleece* wool. They are readily distinguished from each other by the character of the tips or ends of the fibres, those of the hog being pointed on account of the animal not having been previously shorn, whilst those of fleece-wool increase in bluntness each succeeding year. Analysis of the fleece is commenced by spreading it over a table with a wire-cage surface. During sorting a portion of the dust and other hard particles of matter liberated from the wool fall through this cage into a drawer beneath. An indefinite line is formed down the middle of the fleece which the sorter follows in dividing it. His work is of a twofold character. First, he removes a portion of the foreign substances which the fleece contains, and also clips away the hard, clotted tufts of fibres which in the process of growth have become fast adhered together. Secondly, he proceeds to carefully analyse the fleece, classifying the locks according to quality, and casting them into different skeps with which he is provided. The wool is principally judged by its softness of handle and its density of growth. 'Tenderness of staple, unkindness of feel, and want of rankness of hair are all indications of an inferior wool.'

In its natural state wool is impregnated with a greasy compound designated yolk or suint. The object of the succeeding process of manufacture—scouring—is to remove this substance without injuring the staple of the wool. When this work is properly done the material is not only clean and a perfect white, but appears elastic and open. The principal requisites here are a pure, soft water, a mild alkali, uniform temperature of the 'scour,' and as small a degree of mechanical agitation of the wool in washing as is compatible with the thorough cleansing of the fibres. Scouring is effected in machines specially designed for this purpose. They consist of two or more tanks containing the 'scour' or alkaline lye, in which the wool is immersed and gently made to travel from the receiving to the delivery end of the separate tanks, when it passes between a pair of squeezing-rollers, and from thence is conveyed to the drying-chamber. An indifferently scoured wool does not dye a clean colour, and yields an imperfect yarn and an unsatisfactory cloth.

If the material is intended to be *wool-dyed* it is now transferred to the dye-house, but in some instances dyeing takes place in the yarn state, and in others in the woven piece. When preparing wool for *mixture* fabrics the material is dyed before spinning; in some styles of medium and high-class fancies *hank-dyeing* is preferable; while in the simple makes of cloths, or textures of one shade, it is more economical to dye in the piece. Whichever system of dyeing is practised the wool, after scouring, is teazed or *willeyed*. This is a mechanical operation, and is performed with the object of opening and disentangling the felted meshes of the wool. Really this is a preliminary scribbling or carding. The *teazer* or *willey* consists of a large skeleton cylinder mounted with ten arms, each studded with two rows of teeth tapering from the base to the point, and of three smaller rollers termed 'workers' fixed over this cylinder, and also studded with metal teeth which intersect and work between those of the main cylinder when the machine is in motion. The attendant regularly distributes the material on the feed-sheet or endless apron which conveys it to the interior of the machine, where it is engaged by the teeth of the large cylinder making from 400 to 500 revolutions per minute. It travels in the opposite direction to the 'workers,' which only make from 30 to 40 revolutions per minute. Consequently, it has no sooner become charged with wool than the fibres are forced forward to be engaged and 'worked' or opened by the small rollers. This process is continued until the filaments have become sufficiently separated to be in a suitable condition for *oiling*.

One effect of removing the yolk from the wool has been to deprive it of its natural lubricant, and to make it too diffusive and dry to be treated economically without oiling in the subsequent operations of scribbling, carding, and spinning. Oil renders the fibres soft and flexible and preserves their serrated structure and natural length when operated upon by the millions of wire teeth in the carding machines. If a quantity of unoiled material were submitted to the scribbling process two unsatisfactory consequences would ensue. First, the wool would be imperfectly scribbled for the want of those lubricants which facilitate the separation and readjustment of the filaments effected by the scribbler. Secondly, the amount of waste material in the form of flyings and droppings—loose fibres given off by the various cylinders of the scribbling-engine—would be perceptibly augmented. Wool is, therefore, oiled at this stage to soften and smooth its filaments, to impart adhesiveness, and thus at once minimise the loss of valuable material which would otherwise occur in this severe operation. Various compositions are used as lubricants, but the principal are olive or Gallipoli oil and oleine.

The oil is applied manually by spreading the wool in layers on the floor and adding a sprinkling of oil to each layer, or automatically as it passes on to the *fearnought*. This machine is also termed

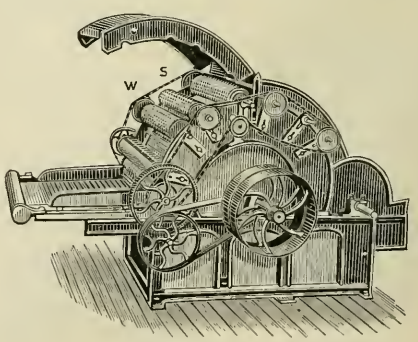

Fig. 3.

the tenter-hook willey, a name which has been applied to it on account of the peculiar form of teeth inserted in its main cylinder. A representation of this machine is given in fig. 3. Essentially it is a minute scribbler possessing three pairs of small rollers, W and S, called workers and strippers,

arranged as in scribbling machines. These rollers glean the wool from the teeth of the swift, and 'work' or intermix and open the fibres between them, ultimately yielding them up to the large cylinder again, which conveys them to the next pair of small rollers, where the process of opening and mixing is repeated. This work is also continued by the third set of rollers, when the wool is once more recovered by the swift and passed on to the fan, which removes it from the machine.

At this juncture the material is prepared for scribbling or carding proper. This process is distinctly a continuation of the treatment to which the fibres have been subjected on the *teazer* and *fearnought*, only the machinery used is more searching in its action, and literally separates fibre from fibre. While disentangling the locks of wool and disintegrating felted meshes of filaments which have escaped the action of the rollers of the previous machines or only been partially operated upon by them, it at the same time reblends the fibres by recrossing them at every conceivable angle, uniting in the process long and short, coarse and fine, curly and straight, and producing by their amalgamation a continuous sheet or texture of filaments of uniform delicacy and density throughout its entire length and breadth.

The scribbling machine (fig. 4) is a combination of cylinders of various diameters, and revolving in opposite directions and at varying speeds. Each roller is covered with *card-clothing*, or with fine, pliable wire teeth. A sample of *clothing* is shown in CW, fig. 4. Obviously, as the wool is transferred from cylinder to cylinder it will be repeatedly opened and reblended, and by degrees made to assume a light, flossy, and workable condition, or

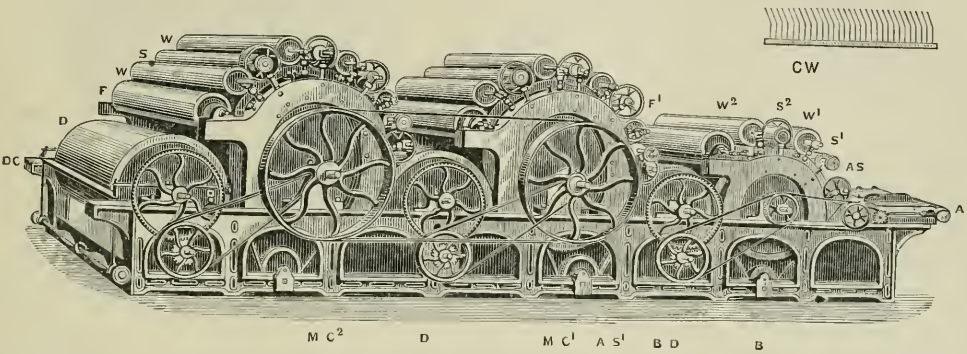

Fig. 4.—Scribbler:

one which may be readily changed into a weavable thread. The amount of dislocation and blending the fibres are subject to in their passage through an ordinary scribbler is almost incredible. It may be understood by considering the immense multitude of points which are incessantly operating on the wool. A machine similar to that represented in fig. 4 contains no fewer than 56,000,000 teeth. These have various functions: 50,000,000 engage the material and convey it from stage to stage, resisting in so doing the action of the teeth of adjacent cylinders which may have become charged with fibres. The remaining 6,000,000 are designated extractors and springers, and lash or draw the wool from between the card-wires of other rollers. In a scribbler mounted in this manner the material is continually operated upon by the dividing and remixing action of 25,000 points. This is not all. A set of carding-machines contains two or three engines, whose rollers all possess card-clothing of increasing fineness, so that by the time the wool escapes from this process a complete disturbance of the natural order of the fibres has been effected, and they have, moreover, been readjusted with such mechanical precision as to be readily convertible into a spun yarn.

The passage of the material through the scribbler may be thus described. It is primarily spread by an automatic appliance on the feed-sheet (A, fig. 4). Before being transferred on to the breast cylinder it undergoes a certain amount of opening and blending, which tends to keep up a uniform supply of fibres. This is accomplished by five small rollers, three of which are called 'feeds,' one the 'licker-in,' and the fifth the 'angle stripper.' The three 'feeds' are fixed one above the other, directly behind them is placed the licker-in, and over it the angle stripper. The wool is no sooner carried by the feed-sheet on to the lowest feed-roller than the licker-in removes a portion of it, which it commences in conjunction with the centre 'feed' to open and intermingle. It is at this point the third or uppermost feed-roller comes into action, and that the angle stripper takes charge of the material and conveys it to the breast cylinder. Here the real work of scribbling is initiated. The card-wire of the cylinder carries the wool forward until it is engaged by the first pair of small rollers (S^1 and W^1, fig. 4). The worker, though placed behind the stripper, gleans the fibres off the cylinder, while the stripper removes or *strips* it from the worker, and in turn yields it up to the rapidly revolving cylinder. It is not the design of the scribbler to accomplish at one process a perfect separation and blending of the filaments, for in so doing it would be liable to break the staple of the wool; hence the several small cylinders employed in disentangling and remixing the fibres. The first pair of rollers are only intended to operate upon the largest entanglements, being set the farthest away from the cylinder, and also the coarsest in card-wire. The material which escapes their points is dealt with by the second couple of rollers (S^2 and W^2, fig. 4), while the smaller tufts of fibres still are engaged by the third set of workers and strippers, and so on throughout the operation. By this repeated transfer from one cylinder to another a continuous opening and mingling of the filaments is carried on from the time they enter the machine at the feed-sheet till they leave the same at the doffer.

Condensing follows scribbling and carding. There has been no attempt made thus far to impart to the wool a thread-like appearance. It is removed

from the last cylinder of the carder by the condenser, whose office it is to divide the sheet of filament into narrow bands, which are passed between a pair of rubbers. These have an action similar to that of the palms of the hands when rubbed together, and give to the several strips or 'slivers' a round form—indeed, convert them into thick, soft, fluffy yarns, incapable of sustaining any degree of extenuation because absolutely free from twist or twine.

Such 'slivers' or condensed threads form the germ of the spun yarn. Spinning (q.v.) is the final process in thread-making. The 'condensed slivers' pass, in the spinning-frame, between a pair of fluted rollers, and from thence to the spindles, which are fixed in a movable carriage. Primarily the rollers give out a length of 'slivers'—the carriage and the spindles receding and the latter imparting twist—and next, the rollers cease to revolve and the spindles increase in velocity, the carriage meanwhile travelling to the end of its traverse. During the latter part of its movement the thread is extenuated or reduced in size, and the final degree of twist is inserted. On the return of the carriage the spindles wind up the spun yarn in 'cop' form.

As weaving is treated of in a special article, the cloth has now to be followed after it leaves the loom, in which condition it is spoken of as being in the 'balk' or raw state. The characteristics of this state are threadiness of surface, looseness of structure, hardness of handle, and lack of smartness of pattern or beauty of design. To make the pieces saleable they are submitted to a lengthy series of processes, including perching, knotting, scouring, hydo-extracting, tentering, mending, milling, washing-off, gig-raising, boiling, cutting or cropping, pressing, brushing, and steaming. Of course cloths are not all passed through these processes, such fabrics as cheviots and tweeds requiring only simple and brief treatment in finishing; but in dressing a doeskin the whole routine has to be gone through.

Perching consists in making a close inspection of the piece with the object of marking all defects. *Knotting* is another manual process. As the smallest knot left in the piece may result in the fabric being torn or cut in the cropping operation, all such protrusions are carefully extracted by examining the under side first, so that the knots may be pulled out; and subsequently the face is treated, when the cloth is ready for *scouring*. The primary object here is to cleanse the piece, and the second to soften the threads and cause them to fill up the interstices existing between them when the cloth leaves the loom. If it were a mere question of scouring it could be readily attained by using strong detergents; but these would not only injure the handle of the fabric, but also affect its brightness of colouring. Scouring-machines are of two great classes—viz. those in which the pieces are twisted into a rope form during the operation, and 'open scourers,' in which the pieces are maintained in an expanded state. The latter are recommended when washing fabrics liable to crease and composed of fine yarns, but ordinary woollen goods are still largely scoured on the older system of having the pieces running through the machine in folds. To discharge the superfluous moisture the textures contain after scouring they are taken to either the wringer or, preferably, to the hydro-extractor (see DRYING-MACHINES). The latter expels the wet by centrifugal force, and, while imparting a lofty and kind feel to the cloth, does not in any way crease its surface as the wringer is apt to do. Defects not detected before the piece is washed are visible afterwards. These are repaired by the mender, who introduces threads or 'picks' where they are missing. Fine goods are difficult to treat in this respect.

The piece is now taken to the milling-machine (fig. 5). Here it is saturated with a solution of soap and then placed in the tank, A, and threaded through one of the divisions in the guide and knocking-off motion, B. Subsequently it runs over

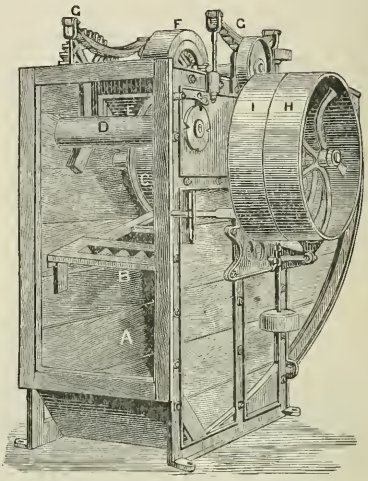

Fig. 5.—Felting, Fulling, or Milling Machine:
A, tank; B, guide frame and knocking-off motion; C, flanged roller; D, guide roller; E, neck; F, top roller; G, G, springs; H, loose pulley; I, driving pulley.

a roller, D, and into the neck or throat, E, and from thence between two rollers, C and F. The lower one is flanged, the upper one fitting between its projection. Pressure is brought to bear on F by the springs, G, and in some cases by weights. As the piece passes between these rollers it is crushed and felted in the direction of the weft or transversely. Running now into an elongated box or the spout of the machine, it is cuttled up lengthways and therefore felted in the direction of the warp. Before the invention of the fulling-mill woollen goods were felted solely by stocks. These are still used, but for ordinary purposes have been supplanted by milling-machines. In the stocks the piece, after soaping, is placed in a trough and pounded by huge hammers or fallers. Goods thus felted possess in some instances a more substantial feel than when treated in the mill. Stock-fulling is a slow process, but is more natural than felting by the milling-machine, and is preferable where great fullness of texture is required.

Before milling, the individual threads in the cloth are quite separate, and by the aid of a powerful glass the scheme of crossing warp and weft may be traced; single threads can be removed without difficulty. But after milling, all traces of the threads as distinct factors have disappeared. Magnifying a sample scarcely makes them visible, for it is only by singeing the surface of a hard-felted woollen, and scraping away the floss and fibre, that the texture proper can be exposed and examined. Then it becomes apparent what changes have been wrought in its condition during felting; a porous fabric has been changed into one remarkable for its density, solidity, and firmness. Wool and hair are the only kinds of fibre that will felt, and the former is infinitely superior to the latter in this respect. Its physical formation, combined with the arrangement of the fibres in a 'carded' or woollen yarn, are at the basis of what takes place in the fulling mill or stocks when the fibres

of individual threads mat, interlock, and dovetail into each other. The soapy condition of the piece, assisted by the heat generated in felting, accelerates this process. Saturated as the cloth is by the soapy compound, its filaments expand. The scaly circumference of one set of fibres is forced into that of an adjoining set, and thus by the pounding or pressure to which the piece is in the meantime submitted the yarns are brought closer together, until the threads literally form one mass of felted wool and lose their individuality. This kind of excessive milling is only applied to certain classes of army cloths, doeskins, pilots, beavers, and other heavy fabrics. After felting, the piece is washed off, hydro-extracted, dried, and then tentered or stretched on the tenter frame.

The processes of 'finishing' proper—viz. raising, cutting, brushing, and pressing—level and smooth the cloth, improve its appearance, develop the elements of the pattern, and add lustre and beauty of texture. *Raising* is generally performed on the gig, a huge cylinder mounted with teazles, the pliant and flexible teeth of which raise up the fibre on the face of the piece. There are two types of raising, *wet* and *dry*. Dry raising is practised in cloths where a clear smart face is required, such as tweeds, 'Saxonies,' and worsted coatings and trouserings. By 'getting up' the fibres and combing them out on the face of the texture it prepares the cloth for an effective and clear 'cut.' The *wet* process is adopted in finishing doeskins, moscows, meltons, and other heavy textures. It is the reverse in its effects to dry raising, aiming at preserving the fibre obtained in milling. Though it 'gets up' the filaments, it spreads or lays them on the texture, so that they give to the piece, after cutting, boiling, and pressing, a bright appearance.

Cropping or *cutting* was formerly a manual operation. Now it is performed on the 'perpetual,' a machine which in principle is identical with the lawn-mower. The surface of the cloth is evened and smartened in this process, the pile of fibres being levelled, and, if a 'fancy' texture, the style of the pattern is more prominently developed. After passing several times through the 'perpetual,' the piece is cuttled up in cardboard papers and placed in the press, heated by hot plates. It remains here till perfectly cool, when it is recuttled to take out the marks formed by folding, and again pressed. Solidity and lustre are acquired in this way, accompanied by a certain degree of harshness or unkindness of touch in the texture, which, however, may be readily removed by steaming, when the cloth is ready for the merchant.

Worsted Manufacture.—There is a difference in the appearance and characteristics of worsted and woollen fabrics, but this does not necessarily arise from the employment of dissimilar materials. It is quite feasible to employ the same class of wool in both manufactures; yet in the *worsted* the texture will be clear and bright, possessing a smartly-defined pattern, but in the *woollen* it will be covered with fibre, have a comparatively rough appearance, and its plan of construction be partially if not wholly concealed. 'Woollen' and 'worsted' as applied to these all-wool fabrics are somewhat ambiguous terms, as they signify neither the material used nor the scheme of yarn-making practised. Before the combing-machine was invented only long-stapled wools were made into worsted yarns; hence it became customary to define a woollen thread as the product of spinning short wool, and the worsted as the result of combing and spinning long wool. But now that all wools of whatever length are combable this definition is quite untenable. Next the worsted was designated a combed thread, to discriminate it from the woollen, which is a carded thread. These are more satisfactory distinctions, but are inapplicable to an important class of worsted yarns. For the worsted coating, trousering, and dress trades the wools employed are invariably prepared for spinning by gilling, combing, and drawing: but for the carpet branch of the weaving industry a worsted yarn is made in which the wool is not combed. The essential difference lies in one important element of procedure in working or preparing the wool for the final operation of spinning. When making a woollen thread the main object to be attained from the initial to the terminating stage of construction is to open, cross, and blend all descriptions of fibres in all possible ways—a routine which yields a yarn which possesses a rough fibrous surface (see fig. 6), and which when converted into a woven texture imparts a mellow and somewhat subdued effect to design and colour. On the other hand, in producing a worsted thread, the primary design is to place the fibres in parallel relationship with each other by in some cases extracting all curly filaments, and in all instances by as far as possible straightening and levelling them, so that a thread results which possesses a regular and well-defined circumference, and one which lends lustre to the fabric and precise development to almost every type of woven pattern.

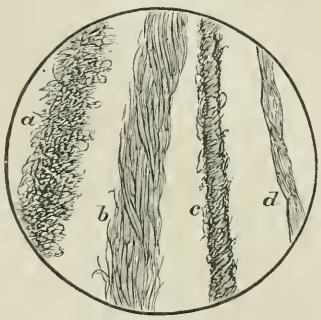

Fig. 6.

a, 30 skeins woollen yarn; *b*, twofold 30's worsted; *c*, 40's cotton; *d*, twofold 60's silk.

Fig. 6 illustrates the main features of dissimilarity between woollen and worsted yarns. Here *a* is the woollen or purely carded thread. At once it will be observed how variously intermingled its fibres are. Under the microscope the core of this yarn is practically a solid mass of filaments, twisting round which is a multitude of curly, wavy fibres of a diversity of lengths and diameters, that cross and intertwine with each other in literally every possible manner. In *b*, which is an enlarged drawing of a worsted thread, an altogether different system of amalgamating fibres in a yarn-like condition is evident. Now the filaments are perceptibly laid in the same plane, and form a somewhat regular thread.

There are three great systems of producing worsted yarns. First, when long wools are used, the material is gilled, combed, drawn, and spun. In the second system carding is added and precedes gilling; while in the third or carpet-yarn system the wool is carded, drawn, and spun. The special operations are those of gilling, combing, drawing, and spinning. Carding, though not precisely the same as in woollen yarn production, is similar in principle, and has been treated of above. Starting therefore with the material as it leaves the carder, previous to which it has been scoured and 'willeyed,' it is not condensed as in preparing for woollen-spinning, but is taken in 'laps' or bands, a few inches in width, and wrapped up into balls, to the backwashing-machine, where it passes through a trough containing 'scour,' and from thence over a number of drying cylinders to what is called the 'gill-box' part of the machine. Here it is engaged by a number of vertical pins fixed in iron bars, and called 'fallers,' which travel from

one end of the box to the other on two pairs of endless screws, one placed above the other. The fallers only operate on the wool when moving on the upper screws. The wool is forcibly drawn through the pins of the fallers by a pair of rollers which have a higher velocity than the rollers which convey it into the box. 'Gilling' proper is a continuation of what occurs in this latter part of the backwasher. Each gill-box—some six boxes make a set—in which the work of gilling is accomplished possesses two pairs of rollers and a set of fallers. The receiving rollers move slower than the fallers, and the fallers in turn move slower than the delivering rollers. The result is that the wool is extenuated, its fibres are straightened and more or less laid in parallel conditions. The drawing-out process is termed the 'draft.' It takes place in every box, whose pins increase in fineness and number, so that the work becomes gradually more searching in character. Should the wool be examined at this stage it would be discovered that, while the longest fibres are comparatively straight, yet the short and curly ones in some instances literally traverse the ribbon, having escaped the action of the gill-pins of the fallers. By the combing-machine a classification of the fibres is made. The long and the straight are utilised in producing what is called the 'top' or combed wool, while the short, 'neppy,' and curly fibres are rejected, and constitute the noil. Combing also levels the wool.

Three distinct types of machines are employed in this work, known as the Noble, the Holden, and the Nip combs. Noble's machine consists of three circular combs, all of which revolve in the same direction, and are mounted in the interior of the framework of the machine. One of these combs has a diameter varying from 48 to 60 inches. It is called the large circle. Inside it are two smaller combs, with diameters of about 18 to 20 inches. They only work in conjunction with the principal circle at one point in their rotary movement. The ribbons of wool from gilling are brought and placed in the framework of the comb, each ribbon being passed through its own feed-box. The laps of wool are now pressed by what is called the 'dabbing' brush between the teeth of the comb of the large and small circles. Combing begins at this juncture, for each circle carries off in the teeth of its comb a quantity of fibres. As the angle between the combs increases the fibres are drawn out and straightened, the longest, which hang in the form of a fringe on the inside of the large comb and on the outside of the small one, being removed by 'drawing-off' rollers, and helping to make the 'top;' while the short and curly, which become imbedded between the teeth of each small comb, are extracted by knives set between the rows of pins of which such a comb consists. The extraction occurs each time the lesser combs revolve, so that it is impossible for the noil or unsuitable fibres to accumulate. All the combings, two from the large and one from each of the small circles, are collected together and passed into a funnel, when a degree of false twist is imparted as the combed 'top' escapes from the machine.

Levelling is performed by frequently drawing out or drafting and doubling the ribbons. Each compound process of drafting and doubling not only further straightens the wool, but yields a result that closer and closer approaches in appearance a spun thread. *Drawing* primarily produces a uniform ribbon, or one in which the several kinds of fibres are regularly distributed throughout its length; and secondly, it forms a slubbing of such fineness that on imparting twist, and further drafting, a spun and weavable thread will result. All drawing frames consist of two pairs of rollers, the 'deliverers' revolving at a higher speed than the 'receivers,' or the pair which bring the wool into the frame. As the ribbons are stretched between these rollers they are drawn out, or drafted. In a series of frames the amount of drawing and doubling to which the wool is submitted reaches the enormous number of fully five and a half millions of changes. On leaving the roving-frame, which may be regarded as the final 'drawing,' the thick thread acquired is ready for Spinning (q.v.). It is important to note that woollen and worsted yarn-spinning differ very materially from each other in principle. When making a woollen thread the sliver is passed direct from the rollers which grip it to the spindle. Moreover these rollers, after delivering a certain length, hold the sliver till extenuation has been effected and twist imparted. The roving in worsted spinning is differently operated upon. It passes between the back pair of rollers on to the front pair, being in the interval elongated. Escaping from these, it is twisted or spun, and wound on to the bobbin.

The yarn thus obtained is prepared for the loom by warping—grouping the requisite number and length of threads together in a systematic manner—by beaming or winding the warp on to the chain or yarn-beam of the loom, and by healding and sleying, processes which assign to the individual threads the positions they are to occupy and the part they are to play in the construction and embellishment of the fabric. After the loom (see WEAVING) has produced the texture, the piece is knotted, scoured, hydro-extracted, tentered, burled, cut, crabbed (wound tightly on to a perforated roller, through which steam is forced), pressed, and steamed (see *Woollen Cloth Manufactures* above).

Worsted manufacturing is now as important a branch of the textile industry as woollen manufacturing. Still the fancy section of it is only a recent growth. Up to 1870 worsted cloths were invariably piece-dyed, the attempts at using fancy yarns in these fabrics having been chiefly confined to the construction of figured and spotted vestings; but in that year the late Professor John Beaumont designed the first hank-dyed worsted yarn coatings and suitings. These were produced in Huddersfield, in which town the highest class worsteds for gentlemen's wear have for some time been manufactured. Bradford, on the other hand, is the home of the fine worsted dress and mantle trades, the productions of its looms competing in style and finish with those emanating from the textile establishments of Roubaix and other manufacturing towns of the north of France. But it must not be inferred from this that worsted-weaving is confined to a limited area in Britain. Leeds and the west of England possess numerous and important mills occupied in the production of combed-yarn fabrics, whilst even in some of the tweed-mills of Scotland small quantities of worsted suitings are made.

One drawback to the worsted texture is that it rapidly assumes in the made-up garment a shiny or glossy appearance, a defect that cannot be obviated without destroying other valuable and characteristic qualities which the fabric possesses. It is a natural sequence to the system of worsted yarn construction. A lustrous thread is aimed at, and to acquire this much of the natural curliness of the wool fibre is combed out, and a quantity of those short curly hairs which give fullness of touch and wearing power to the woven fabric are extracted. The result is a fabric that is liable to wear shiny, and one that is more porous in structure and less kind in the hand than the carded yarn production. For serviceability the worsted texture is not comparable with the woollen. Certainly it has its advantages. When new it is smarter than the woollen, and undoubtedly possesses a smoother and more attractive surface; but such qualities are

fugitive. If freshness of design, novelty of textural construction, and fineness of fabric are required, worsted are the yarns *par excellence* for attaining these results; but if it is desirable to obtain a cloth distinguished by unique softness and elasticity of touch, mellowness of colour, and warmth and comfort in the wear, then it is necessary to employ threads constructed on the woollen principle of yarn manufacture.

The importance of the British trade in wool and wool manufactures may be gathered from the statistics of three selected years given at GREAT BRITAIN (Vol. V. p. 377), which show the imports and exports of wool and of woollen and worsted goods. In 1890 the total imports of wool into the United Kingdom were 633,028,131 lb., and of exports 340,712,303 lb.; so that 292,315,828 lb. were retained for home consumption. Of the total imports nearly 419 million pounds came from Australasia; probably 138 million pounds were produced at home. In the same year woollen and worsted piece goods to the amount of 261 million yards were exported, and 41 million pounds of yarn. In 1890 the value of woollen and worsted yarn exported was £4,086,000; of woollen cloths, coatings, &c., £6,016,000; of worsted coatings and stuffs, £10,360,000; of flannels, blanketings, &c., £1,097,000; of carpets and druggets, £1,115,000. In the same year the value of woollen yarn imported was £1,952,000, and of woollen manufactures £9,321,000. There were, in 1890, 1793 woollen and worsted mills in the United Kingdom. As has been mentioned at ENGLAND (Vol. IV. p. 347), the chief seats of the wool manufacture in England in the 14th century was Bristol, London, and Norwich. Now Wiltshire (q.v.) and Gloucestershire are famous for the finest broadcloths; the West Riding of Yorkshire is, however, the great seat of the woollen manufacture, Leeds and Huddersfield being very important centres. Galashiels and Hawick are noted for their tweeds.

In the United States the chief wool-manufacturing states are New Hampshire, Massachusetts, Rhode Island, New York, and Pennsylvania. The total value of the woollen goods produced in 1870 was over $151,000,000, of worsted goods $22,000,000; in 1880 the corresponding figures were $166,600,000 and $33,500,000. In 1890 the United States imported close on 103,000,000 lb. from Argentina, Turkey in Asia, Australasia, Britain, Russia, China, &c. The yarn imported had a value of nearly $2,000,000; of cloths, $16,000,000; of women and children's dress goods, $24,200,000; of ready-made clothing, nearly $2,000,000.

In 1898 Britain imported wool to a value of £23,437,309, and woollens and yarn valued at £10,839,452; and exported woollens to the value of £13,702,307, and woollen and worsted yarn worth £4,625,898. In 1897–98 the United States imported wools worth $16,783,692, and woollens worth $14,823,771; the exports being unimportant.

See Bowman's *Structure of the Wool Fibre*, Beaumont's *Woollen and Worsted Cloth Manufacture*, Beaumont's *Woven Design*, M'Laren's *Woollen and Worsted Spinning*, and Alcan's *Traité du Travail de la Laine Cardée*. Also the articles SHEEP, CARPETS, FLANNEL, FELT, FRIEZE, SHAWLS, &c.

Woollett, WILLIAM (1735–85), engraver to George III. See ENGRAVING, Vol. IV. p. 380; and L. Fagan's *Catalogue Raisonné* of his 123 engraved works (1885).

Woolner, THOMAS, sculptor and poet, was born at Hadleigh in Suffolk, 17th December 1826, and was educated at private schools till he began his training as sculptor. 'Eleanor sucking the Poison from Prince Edward's Wound' (1863), 'The Death of Boadicea,' and 'Puck' attracted much attention, and were followed by 'Titania,' 'Eros,' 'The Rainbow.' He was closely associated with the Pre-Raphaelites, and contributed some poems to *The Germ*—poems which with others were published in a volume as *My Beautiful Lady* (5th ed. 1892). In 1862–64 he was in Australia; and on his return he rapidly rose to the front rank amongst English sculptors, grace and refinement being the notes of his work. Besides statues of Lord Bacon and William III., he executed statues or portrait busts of most of his famous contemporaries—Macaulay, Whewell, Palmerston, Cobden, Dickens, Kingsley, Carlyle, Darwin, Newman, Tennyson, Huxley, Gladstone, and many others. Other ideal works are 'Elaine,' 'Ophelia,' 'In Memoriam,' 'Virgil,' 'Guinevere,' 'Achilles and Pallas,' 'Lady Godiva Unrobing.' Made A.R.A. in 1871 and R.A. in 1874, he was professor of Sculpture to the Academy in 1877–79. Other poems were *Pygmalion*, *Silenus*, *Tiresias*, and *Nelly Dale*. He died 7th October 1892.

Woolsack, the name given to the seat of the Lord Chancellor of England in the House of Lords, whose essential portion is a large square bag of wool without either back or arms, and covered with red cloth, the whole forming a kind of cushioned ottoman, standing near the centre of the chamber. It is believed that woolsacks were placed in the House of Lords in the time of Edward III. to remind the peers of the importance of England's staple trade. An Act of Henry VIII. directs that the Lord Chancellor, Lord Treasurer, or other high officer shall sit and be placed at the uppermost part of the sacks in the said parliament chamber, either there to sit upon one form or upon the uppermost sack. D'Ewes says the Lord Keeper sat on the woolsack in 1559, when her majesty (Queen Elizabeth) was absent; the other woolsacks being as now allotted to the other judges. It 1621 it was declared in the standing orders of the House of Lords that 'the Lord Chancellor sitteth on the Woolsack as Speaker to the House'—i.e. not in his judicial capacity. See *Notes and Queries*, 4th series, vol. iii. p. 384.

Woolsey, THEODORE DWIGHT, was born at New York, 31st October 1801, graduated at Yale in 1820, and after studying in Europe was professor of Greek at Yale from 1831 to 1846, and then its president till 1871. In 1871–81 he was president of the American company of revisers of the New Testament. Besides editions of Greek plays, &c. his works include an *Introduction to the Study of International Law* (5th ed. 1879), *Essays on Divorce and Divorce Legislation* (1869), and *Political Science; or the State, theoretically and practically considered* (2 vols. 1877). He died 1st July 1889.

Woolsorter's Disease. See ANTHRAX.

Woolston, THOMAS, an ultra-heterodox and eccentric Deist, was born at Northampton in 1669, entered Sidney Sussex College, Cambridge, in 1685, became a fellow, and took orders. The study of Origen and his allegorical interpretation of the Scriptures seems to have turned his head, and in 1705 he published the *Old Apology for the Truth of the Christian Religion against the Jews and Gentiles revived*. Here Woolston maintained that Moses was only an allegorical personage, and all his history typical of that of Christ; that the miracles of the Pentateuch were allegorical, and the miracles attributed to Christ and the apostles pure allegory too; and he stigmatised as atheists and apostates all who received the Scripture narratives as literally, historically true. In subsequent publications he went further in the same direction; also maintaining that the Quakers approached more nearly in doctrine and organisation to the primitive church than any other religious body; and denouncing clergymen, because they made a profession of the

pastorate, as 'hireling priests,' worshippers of the Beast, and ministers of Antichrist. In 1721 he published *The Moderator between the Infidel and the Apostate*, dialogues tending to show that the gospel miracles by themselves could not prove Christ to be the Messiah. This work occasioned great scandal, and it was only through the intervention of Whiston that the author escaped a prosecution. In 1721 his college deprived him of his fellowship. The views set forth in his last work Woolston developed more fully in *The Moderator between an Infidel and an Apostate* (1725), the former being Collins, the latter the modern Anglican clergy who had fallen away from the allegorical method of the Fathers and become priests of the letter. His famous series of six *Discourses on the Miracles of Christ* appeared from 1727 to 1729, with two *Defences* in 1729 and 1730. Here he maintained with much vulgar and offensive iteration that Christ's miracles in themselves were open to the gravest doubts; that in fact the gospel narratives, if they were to be taken literally, were only a tissue of absurdities; yet he loudly claimed to be a sincere Christian holding fast by the allegorical residuum of the miraculous history, and even Lechler takes him at his own valuation, but Trench, Strauss, and Cairns are more likely correct in counting this profession a mere blind. No less than sixty answers were made to the *Discourses;* but what was much worse, an indictment for blasphemy was brought against the writer. He was tried before Chief-justice Raymond at Guildhall, sentenced to be imprisoned for a year, to pay a fine of £100, and find securities to the amount of £2000 that he would not repeat his offence. He was imprisoned in the King's Bench, and the remainder of his life was spent within its rules. Here he died, 21st January 1731.

His works were collected in 1733 in 5 vols. with a Life. See Leslie Stephen's *History of English Thought in the 18th Century* (1880), and the works on Deism by Leland, Lechler, and Sayous.

Woolwich, a parish in Kent, and part of the royal manor of Eltham, on the river Thames, about 9 miles below London Bridge, was in 1885 constituted a parliamentary borough returning one member. The population of that borough in 1891 was 98,976, of whom 40,848 were in Woolwich itself (32,367 in 1851). The principal part of the town lies on the south bank of the river, but it has extended into Essex under the name of North Woolwich. A free steam ferry or floating bridge carrying vehicles connects the two portions. The town is chiefly important on account of the Royal Arsenal, employing some 12,000 men, whose wages exceed £72,000 a month. This establishment may be said to date from 1585, when Queen Elizabeth had a store of arms and armour at the Tower House, a mansion in Woolwich Warren adjoining the then boggy and unhealthy marshes of Plumstead. Prince Rupert protected the King's Warren with batteries in Charles II.'s reign, and other fortifications were added by that king's successor. The Dutch had several times threatened the dockyards here and at Chatham, and in 1695 two French privateers were captured off Woolwich. These fortifications have now disappeared. Towards the end of the 17th century the proof of ordnance was transferred from Moorfields to Woolwich, guns began to be cast there, carriages constructed, and powder stored. From these works grew the three great departments of the Royal Arsenal called respectively the Royal Gun Factories, Royal Carriage Department, and Royal Laboratory. But these names were not given until after the second visit to the Warren of George III. in 1805. The establishment then grew rapidly in importance. From 42 acres the ground covered by it extended to some 300. Guns of all sizes, every form of military wagon, shot, shell, torpedoes, cartridges, bullets, war, signal, and life-saving rockets, tubes, and fuzes have since always been produced there, small-arms being made at Birmingham and Enfield, in Essex, and powder, gun-cotton, and other explosives at Waltham in the same county. The wharves were enlarged by convict labour. A canal first and then lines of railway were constructed, together with piers and powerful steam and hydraulic cranes. Extensive practice ranges also were added in the Plumstead marshes, which had been carefully drained and embanked against the river. Machinery of the best and most modern type fills the workshops, and immense quantities of all kinds of warlike stores are collected, ready for issue to either the army or navy of the empire. As this establishment is the only government gun-factory, its importance cannot be overrated.

The garrison of Woolwich consists of a major-general commanding with his staff, the headquarters of the Royal Regiment of Artillery, of the Ordnance Store Corps, and of the Army Service Corps; some thirteen batteries of artillery, one infantry battalion, a strong body of Volunteer Artillery, and a battalion of Rifle Volunteers, together with a considerable number of men of the various departmental corps. The barracks occupied by the troops are very imposing buildings. The Herbert Hospital, built soon after the Crimean war at the south end of Woolwich Common, is one of the largest military hospitals in Great Britain. The common itself, nearly half a square mile in extent, forms an excellent drill-ground. At its south-west corner there is a hut camp for two field batteries, and opposite to it the handsome buildings of the Royal Military Academy. This is the oldest military school in the kingdom, dates from 1741, when forty cadets were quartered in the arsenal for training in artillery and engineer duties. In 1806 the building on the common was occupied by some 150 cadets, a number which increased at one time to as many as 280. All are destined for the Royal Artillery or Royal Engineers. Another military educational establishment at Woolwich is the Artillery College, for giving special training to officers of the Royal Artillery, in order to fit them for appointments in the manufacturing departments of the Royal Arsenal, &c. It is located in the red barracks, built originally as a hospital for the marines, one division of which corps was quartered at Woolwich until 1869. In this year the Royal Dockyard at Woolwich was closed, as it was found unsuitable for modern ships of war, but it continues to be used as a military store depôt. It was the first and for long the principal dockyard in the kingdom. The *Great Harry* was built there in 1562, the *Royal George* in 1751, the *Galatea* in 1859, and more than 200 other ships.

At the north-west end of the common is the Repository, enclosed with a breast-work, and containing drill-sheds and materials for shifting heavy guns, building military bridges, &c., and the Rotunda Museum of military antiquities and models. Part of the Repository enclosure is laid out as a pleasure-ground. Close to the Rotunda is a small observatory belonging to the Royal Artillery Institution, which is itself part of the artillery barracks, and contains a natural history museum, a valuable library, many military relics, and a lecture hall for the discussion of papers on military subjects. St George's Garrison Church, near the artillery barracks, opened in 1863, is one of the most conspicuous buildings in the town. Few of the others are important. Woolwich, whose greatest son was General Gordon, has gradually become a suburb of London, and is connected with it by a railway and tramway. Plumstead on the east and

Charlton on the west merge into Woolwich. Like it they are densely populated, and may be considered part of London. See ARTILLERY, CANNON, FUZE, MILITARY SCHOOLS, ROCKET, SHELL, &c.

Woonsocket, a town of Rhode Island, on both sides of the Blackstone River, 38 miles by rail SW. of Boston, with manufactures of iron, rubber, and especially cottons and woollens. Pop. (1880) 16,050; (1890) 20,830.

Woorali. See CURARI.

Wooster, capital of Wayne county, Ohio, on Killbuck Creek, 135 miles by rail W. by N. of Pittsburgh, is the seat of a Presbyterian university (1866). Pop. (1890) 5901.

Worcester, the county town of Worcestershire, 27½ miles by rail SW. of Birmingham, 65½ NNE. of Bristol, and 121 (by road 111) WNW. of London. It stands on the left bank of the Severn, here crossed by a five-arch stone bridge (1781–1841), 270 feet long. Previously perhaps a station of the Romans, *Wigornaceaster* became in 679 the seat of a Mercian bishopric, whose cathedral is Worcester's chief glory. It is a double cross in plan, 410 feet long, 126 wide across the west transept, and 60 to 67 high, with a central tower of 196 feet. Rebuilt from 1084 onwards, and restored since 1857 at a cost of £100,000, it is mainly Early English and Decorated in style, but retains a very interesting Norman crypt, and has Perpendicular features. The simplicity, if not plainness, of the exterior is amply compensated by the fine perspective of the lofty groined roof, and the general noble effect of the interior. One may specially notice the columns of Purbeck marble, the 14th-century choir-stalls and misereres, the elaborate modern reredos, the circular chapter-house, the splendid peal of twelve bells, and the tombs of King John, Prince Arthur, Lord Lyttelton, the Earl of Dudley, and (in the cloisters) 'Miserrimus,' a not very wretched Nonjuror. At Worcester, alternately with Hereford and Gloucester, are held the festivals of the 'Three Choirs.' The old episcopal palace is now the deanery, the present palace since 1842 being Hartlebury Castle, 11 miles N.; and the cathedral school (1541) occupies the superb 13th-century refectory of a Benedictine priory. There is also Queen Elizabeth's school (1561). Nothing remains of the castle, and the Guesten Hall was ruthlessly pulled down in 1860; but there are a fine hall called the Commandery, a gatehouse ('Edgar's Tower'), and a good many old timbered houses, while of public buildings may be noticed the guildhall (1723), the shire-hall (1835), and the museum and free library (1836–79). Worcester is the seat of such well-known industrial establishments as the Royal Porcelain Works, dating from 1751, and covering 5 acres, the glove-manufactory of Messrs Dent (a Glovers' Company was incorporated in 1497), and the 'Worcester Sauce' factory of Lea & Perrins; besides huge vinegar-works, great nurseries, and manufactories of railway signals, chemicals, &c. In the neighbourhood are hop-yards. Worcester is a municipal borough, chartered by Richard I. in 1189; a parliamentary borough, returning only one member since 1885; and also, since 1888, a county borough. Pop. (1851) 27,528; (1881) 38,270; (1891) 42,905. Worcester was the scene of numberless sieges from the time of the Danes down to the 'crowning mercy' of Cromwell, when, on 3d September 1651, he routed Charles II., killing 4000 and making 7000 prisoners. Charles afterwards commemorated the loyalty of the citizens by granting them the motto of 'Civitas fidelis.' Natives have been the alchemist Kelly, Lord Somers, and Mrs Henry Wood; whilst among the eighty and more bishops have been St Dunstan, St Oswald (961–992), St Wulfstan (1062–95), Walter Cantilupe, Simon de Montfort's adherent (1237–66), Latimer (q.v.), Whitgift (q.v.), Ganden (see EIKON BASILIKE), Stillingfleet (q.v.), Hough, Hurd (q.v.), and Perowne (q.v.).—For FLORENCE OF WORCESTER, see that article.

See works by T. Abingdon (1717), W. Thomas (1737), C. Wild (1823), J. Britton (1835), Professor Willis (*Journal Archæol. Inst.*, vol. xx.), M. E. Walcott (1866), J. Noake (1866), and J. G. Smith and P. Onslow (1883).

Worcester, a capital of Worcester county, Massachusetts, and the second city of the state, is pleasantly situated in a valley and on the surrounding hills, on Blackstone River, 44 miles by rail WSW. of Boston. Several suburban villages are included within the 36 sq. m. of the municipality. 'The Academic City' contains, besides excellent public schools, the state normal school, two state lunatic asylums, a military institute, high school, Jesuit college, Baptist academy, a large women's school, an industrial school, &c. Its churches include many handsome buildings, and from the porch of the Old South Church the Declaration of Independence was first read in Massachusetts. Worcester stands on several railways, which meet in a granite Union Depôt, and has a flourishing trade; but it is more notable for its many busy manufactures. Of these the chief are boots and shoes, iron products, and woollens; its wire-mills are the largest in the world. Worcester was settled in 1675–1713. Pop. (1880) 58,291; (1890) 84,655.

Worcester, EDWARD SOMERSET, MARQUIS OF, inventor of the steam-engine, was born about 1601, probably at Worcester House in the Strand, the eldest of the thirteen children of the fifth Earl and first Marquis of Worcester (*c.* 1577–1646). He was brought up at Raglan Castle, and in 1628 married Elizabeth, daughter of Sir William Dormer, soon after which we find him engaged in mechanical pursuits in conjunction with the 'unparalleled workman,' Caspar Kaltoff, his life-long assistant. His first wife died in 1635, leaving him one son and two daughters, and in 1639 he married Lady Margaret O'Brien, daughter and co-heiress of the Earl of Thomond. A devout Roman Catholic, during the Great Rebellion he cast in his lot from the first with the king; in 1642 was made General of South Wales; in 1644 was created Earl of Glamorgan, having till then borne the courtesy title of Lord Herbert; and in 1645 was despatched to Ireland to raise troops for the king's service. His mission—a secret one—miscarried; and, Charles disowning him with characteristic duplicity, he was for a brief space imprisoned. In 1646 he succeeded his father, who had stoutly defended Raglan Castle against the Roundheads; and in 1648 he went into exile in France. In 1652, venturing back to England, he was sent to the Tower, but in 1654 was let out on bail, and at the Restoration recovered a portion of his vast estates—he claimed to have disbursed £918,000 'for king and country.' He died in London, 3d April 1667, and was buried at Raglan. His *Century of Inventions*, written in 1655, but first printed in 1663 (more than twenty times reprinted), gives a brief account of a hundred inventions—ciphers, signals, automata, mechanical appliances, &c. No. 68 deals with 'an admirable and most forcible way to drive up water by fire'—the steam apparatus which could raise a column of water to the height of 40 feet, and which seems to have been actually at work at Vauxhall from 1663 till 1670, Cosmo de' Medici III., Grand-duke of Tuscany, having seen and described it in 1663.

See the *Life of the Marquis of Worcester* (1863), by Henry Dircks, prefixed to his annotated reprint of the *Century*.

Worcester, Joseph Emerson, lexicographer, was born at Bedford, New Hampshire, August 24, 1784. Although employed in youth in agricultural labour, he gave himself a liberal education, entered Yale College in 1809, and graduated in 1811. For some years a teacher at Salem, Massachusetts, he gave his life thereafter to continued literary labours down to its close at Cambridge, Massachusetts, October 27, 1865. All his works were laborious, but most of them unhappily ephemeral: gazetteers, manuals of geography and history, the *American Almanac* (1832–43). He prepared an edition of Chalmers' abridgment of Todd's Johnson's Dictionary, together with Walker's Pronouncing Dictionary (1828), abridged Webster (1829), and printed his sound and sensible *Comprehensive Pronouncing and Explanatory English Dictionary* (1830; enlarged ed. 1855). His *Universal and Critical Dictionary* followed in 1846; his great quarto *Dictionary of the English Language* in 1860.

Worcestershire is an inland English county of very irregular outline, bounded on the N. by Shropshire and Staffordshire, E. by Warwickshire and Oxfordshire, S. by Gloucestershire, and W. by Herefordshire and Shropshire. Its extreme northern and southern length is 50 miles, and its greatest breadth, east to west, 26 miles; but from the irregularity of its borders its area is but 738 sq. m., or 472,453 acres. Pop. (1801) 146,445; (1851) 276,926; (1881) 380,283; (1891) 413,753. The Severn is the chief river, and is navigable throughout the county from Bewdley to Tewkesbury, passing by the city of Worcester. The Warwickshire or Upper Avon, which enters Worcestershire near Cleeve, and passes by Evesham and Pershore, falling into the Severn at Tewkesbury, is also navigable. The other rivers of the county are mostly feeders of these two—the Stour, the Salwarp, and the Teme of the Severn, and the Arrow of the Avon. A small portion of the north-east corner of the shire lies in the basin of the Trent. The canals were of great importance before the development of the railway system, the Stourport uniting the Trent and Severn navigations, and the Worcester and Birmingham leaving the Severn at Diglis, and connecting at Birmingham with the general canal system. The local railways are those of the Midland and Great Western systems. The surface of the shire is diversified and picturesque, with many landscapes of great beauty. The chief hill range is that of the Malverns, on the border next Hereford; the Cotswolds stretch between Worcester and Gloucester; the Clents command part of the Warwick and Stafford frontier, chiefly of the 'Black Country;' the Lickey range is more central. The Clee Hills lie well to the north-west in Shropshire, but high broken ground stretches thence to the verge of Worcestershire in the romantic forest of Wyre. It is to the constant presence of one or other of these bold upland regions that the valleys of the Severn and the Avon owe that singular combination of sylvan and pastoral beauties which makes the landscapes of the county typical of some of the most characteristic and attractive phases of English scenery. The geology of Worcestershire is varied and interesting. Triassic rocks occupy most of the central region, with the Lias and Oolite of the Cotswolds on the south, and on the north Permian, Carboniferous, and Devonian. In the upland to which the Clent and Lickey Hills belong Silurian and Archæan rocks occur, and in the Malvern range Silurian, Cambrian, and Archæan. Taken in connection also with their igneous features, the Malvern Hills are almost unsurpassed for geological interest in the kingdom. The Rowley Rag basalt in the north-east corner of the county is noteworthy. The Silurian strata of Dudley are highly fossiliferous, and there are a number of good fossil localities in the Malverns and near—chiefly Silurian and Devonian. The mineral wealth of Worcestershire has had chief influence on its more recent history. As a whole it is a highly fertile agricultural region, with upland sheep-walks, productive tillage ground, and a very extensive fruit-growing area. Plums, pears, and apples are grown in enormous quantities, the neighbourhood of Pershore being the chief plum-growing centre in the kingdom, while the apples and pears are largely used in the manufacture of cider and perry. The more northern districts are, however, chiefly engaged in manufacture. Salt has been raised from the brine-springs at Droitwich (fed by immense beds of rock-salt in the Trias) certainly for more than 1000 years. The manufacture of iron, carried on by the Romans, has developed into the busy industries of the unlovely 'Black Country,' of which Dudley, with iron-mines and collieries, is the chief centre. Special branches of iron and steel industries are represented by the chain manufacture at Cradley and Netherton; nail-making at Halesowen and Bromsgrove, with edge-tools and smaller wares; while Redditch and Feckenham make needles and fish-hooks, and Brierley Hill turns out immense quantities of the coarser hardwares. Other developments of local mineral resources are seen in the fireclay goods of Stourbridge, and the glass wares produced there and at Stourport. The famous porcelain-works of Worcester have not the same immediate local connection. In the middle ages a great deal of cloth was made, which may now be regarded as represented by the carpet-weaving of Kidderminster; and there is another important local industry in the gloving of Worcester city.

Little is known of the early history of the county, but the Romans seated themselves at Worcester as a frontier town when they defeated the Silures. In Saxon days it first fell into the hands of the Hwicci, and then became part of Mercia. The shire chiefly finds place in the national life in connection with its city; but three of the great decisive battles of English history were fought wholly or in part upon its soil. At Evesham, August 4, 1265, Simon de Montfort was defeated and slain; at Tewkesbury, May 4, 1471, the Lancastrians under Margaret suffered their sorest defeat; at Worcester, September 3, 1651, Cromwell gained his 'crowning mercy.' Some of the most active participators in the Gunpowder Plot were associated with Worcestershire (see Secret Chambers). Antiquities of the older type are not numerous; still there are some fine earthworks, and those on the Herefordshire Beacon, the highest point but one of the Malverns, are among the finest in England. (This hill is 1370 feet high; the Worcestershire Beacon, the highest point in the county, 1440 feet.) The architectural antiquities of the county are chiefly ecclesiastical. There is remarkably fine Early English work in the cathedral, with a very noteworthy Norman crypt, and much that is interesting in the remains of the religious houses, as at Malvern, Pershore, and Evesham. There are many half-timbered dwellings, some of great merit. The changes in the civil organisation of the county have not been great. Before 1832 the shire had nine members; Dudley and Kidderminster were then enfranchised, and the total increased to twelve; at present there are eight, one each for five county divisions, and for Worcester, Dudley, and Kidderminster. Worcester and Dudley are county boroughs, and the other municipalities are Bewdley, Droitwich, Evesham, and Kidderminster. Of Worcestershire worthies may be mentioned Sir Thomas Littleton, Bishop Bonner, Samuel Butler,

T. Blount, Ralph Sheldon, John Baskerville, Lord Lyttelton, S. Foote, Warren Hastings, W. Huskisson, and Sir Rowland Hill.

See works by T. R. Nash (2 vols. 1781–99), J. Chambers (worthies, 1820), Sir C. Hastings (nat. hist. 1834), G. E. Roberts (geology, 1860), Lees (botany, 1867), J. Noake (1868 and 1877), W. Niven (old houses, 1873), and the present writer, R. N. Worth (1889).

Worde, Wynkyn de, pupil and successor of Caxton (q.v.), was most probably a native of Worth in Belginm. It is not known when he entered Caxton's service, but most likely it was at a very early age, as he was still living in 1535. In 1491 he succeeded to the stock-in-trade of his deceased master, but he did not append his name to his books till 1493. From about 1502 onwards he worked in Fleet Street at the sign of the Sun. He used on his books many varieties of Caxton's 'mark,' and Mr Blades gives as many as fourteen variant forms of his own name. Wynkyn de Worde made great improvements in the art of printing, and especially in that of type-cutting. But it was more likely Pynson than he that first introduced Roman letters into England, using them as we now use italics. The books printed by him—408 in number, according to the list in Dibdin's edition (1810) of Joseph Ames's *Typographical Antiquities*—are generally distinguished by their neatness and elegance, hardly by their accuracy, nor, a few excepted, by the literary value of their contents.

Wordsworth, William: 1770–1850. Descended from an old north-country stock, dwelling in Yorkshire and Westmorland, Wordsworth was born 7th April 1770 at Cockermouth, on the Derwent, 'fairest of all rivers,' within sight of the mountains among which were to be his home his happiness and his grave. There and at Penrith, (where Mary Hutchinson, his beloved wife to be, was his schoolmate), the child's first years went by, perhaps with little control, for his parents died early: stiff, moody, and violent in temper as he describes himself; the tough, stern dalesman's nature which, softened and elevated, passed into the strong truthful self-dependence, the high invincible moral courage, the plainness of phrase which often rendered him misunderstood in later life. Sent to school (1778) at Hawkshead, a singularly picturesque village over Esthwaite Lake, he enjoyed healthy freedom, not, we may believe, without 'the silent thoughts that search for stedfast light,' both in studies and sports: exchanged, (1787–91), for far less congenial days at St John's, Cambridge. Here he read widely without plan or academic purpose, yet meditating much, and with a vague but firm hope that his life would leave some achievement 'which pure hearts should reverence.'

Copyright 1892 in U.S. by J. B. Lippincott Company.

In 1790 Wordsworth visited France and Switzerland: France again in 1791–92. Journeys in fact, with him as with Tennyson, were the most salient events in the poet's quiet outward career. But Wordsworth's two visits to France, besides supplying him with a crowd of motives for song, proved the great determining experience of his life, though in a bent opposite to that which they then seemed to give. The France of 1790, in the genial stage of intoxication with the first draughts of liberty, the 'sublime senselessness of joy,' filled him with enthusiasm: and even the excesses of 1792, (when he barely escaped death in that fatal September), left his republicanism dominant. But the spell of that Masque of Anarchy, soon exchanged for tyranny by invariable sequence, gradually and sadly passed: he recognised that nations must 'stand on the ancient ways' if they are to advance safely; by process of the 'years that bring the philosophic mind,' exchanging the love of the false liberty for that of the true. In Dean Church's fine phrase, the trial and the struggle he went through 'annealed his mind to its highest temper.' And henceforth a passionate devotion to England, felt 'as a lover or a child,' and deep as Shakespeare's or Tennyson's, possessed him:

> Ah! not for emerald fields alone,
> With ambient streams more pure and bright
> Than fabled Cytherea's zone
> Glittering before the Thunderer's sight,
> Is to my heart of hearts endeared
> The ground where we were born and reared!

Two poems in 'heroic' metre were Wordsworth's first step towards publicity (1793): the *Evening Walk* and *Descriptive Sketches*, written 1787–92; the latter reflecting his Swiss and earlier French experiences. 'Seldom, if ever,' Coleridge wrote (1817) 'was the emergence of an original poetic genius more evidently announced.' But this and the next two years, whilst the darkness gathered deeper over France, were a time of restlessness and misery to Wordsworth: he was passing through the throes of personal poverty, of mental disillusion and renaissance. In 1795 Calvert, a young friend, left him £900, a sum which to Wordsworth was competence. Encouraged thus, and by the presence of his loved and gifted sister Dorothy, 'sister of his soul,' he now consciously 'found himself,' taking poetry alone as 'his office upon earth.' Settling at Racedown near Crewkerne (1796), Wordsworth first saw the great Coleridge, another critical moment in his poetic development: moving, (1797), for Coleridge's neighbourhood, to Alfoxden by the Quantocks. That beautiful district, and a tour by the Wye, bore fruit in his *Lyrical Ballads* (1798): republished, with a second volume (1800). After some months in North Germany, he moved to the fair region he was so splendidly to make his own, settling first (1799) at Grasmere.

These happy fertile years (1798–1808) were crowned with happiness by marriage, a perfect marriage, (1802), with Mary Hutchinson, known from childhood: another of the striking parallels between Wordsworth and Tennyson. In 1805 he finished the autobiographical *Prelude*, deferred for publication during his lifetime: 1807 gave us two fresh volumes, recording many experiences of life, many of his most memorable poems:—of which, hereafter. Some of his most perfect work was then due also to the Scotch journey of 1803 in his sister's inspiring company.

Few events remain for notice. 1814 and 1832 saw more visits to Scotland; the last noteworthy as the farewell to Walter Scott. Though working on very different lines, respect and love united these two great writers: and we may here name among Wordsworth's friends Coleridge, Lamb, Southey, Rogers, Sir George Beaumont, Lord Lowther, his own brothers, (John, to his great grief, drowned 1805); with several noble-natured and gifted ladies. Many he overlived: but the loss which, though wounding him most, he met with perfect resignation, was the death of his daughter Dora (1847). In 1814, (to conclude our brief bibliography), appeared *The Excursion:* 1815, the *White Doe:* 1819 and 1820 the *Duddon* sonnets and other pieces. 1820 and 1837 mark visits to Italy, deeply enjoyed and utilised in verse, 1822, 1842: in 1835 came *Yarrow Revisited* and *Sonnets to Liberty and Order.*

Some popularity, long deferred, some honours, meanwhile awaited the poet whose career, (to take a figure from Coleridge), had so far outstripped his critics that he seemed dwarfed in their eyes. In 1839 Oxford, amidst deep applause, gave him the Doctorate. Most precious, however, in Words-

worth's mind was the heart-felt and noble welcome received from Keble; a poet of whose first work he spoke 'with love and delight,' whilst characteristically and justly dwelling upon its inaccuracy or want of finish in diction: 'I like the volume so much, that, if I was the author, I think I should never rest till I had nearly rewritten it.'—Here let us quote a few of Wordsworth's recorded remarks upon some of his brethren in art. Speaking of his admiration for Chaucer, he adds his profound reverence 'for him as an instrument in the hands of Providence for spreading the light of literature through his native land.' 'I admire Dryden's talents and genius highly, but his is not a poetical genius.' 'Milton was an aristocrat in the truest sense of the word.' His blank verse, like Tennyson, he held was framed from the Vergilian hexameter; *Paradise Regained*, 'the most perfect in *execution* of anything by Milton: that and the *Merchant of Venice*, in language almost faultless.' 'Ariosto is not always sincere, Spenser always so.' Two remarks on Goethe go deep: 'He had not sufficiently clear moral perceptions to make him anything but an artificial writer;' and that one recorded and endorsed by Matthew Arnold, 'Goethe's poetry was not *inevitable* enough.' If Coleridge had not, in Germany, received the bent to 'metaphysical theology, he would have been the greatest, the most abiding poet of his age.' Profoundly as Wordsworth was impressed and influenced in style by Burns, he candidly notes that the *Scots wha hae* 'is poor as a lyric.' 'I don't like to say all this: but, as a poet, Scott *cannot* live, for he has never in verse written anything addressed to the immortal part of man.' He notices (1827) the faultiness of Byron's language; adding 'Shelley is one of the best *artists* of us all: I mean in workmanship of style.' 'Horace is my great favourite, I love him dearly.' 'First read the ancient classical authors, *then* come to *us;* and you will be able to judge for yourself which of us is worth reading.' 'Very few books,' let us here add from De Quincey, 'sufficed him; he was careless habitually of all the current literature, or indeed of any literature that could not be considered as enshrining the very ideal, capital, and elementary grandeur of the human intellect.'

In 1842 he resigned the office of distributor of stamps for Westmorland, which he had held for thirty years, and which was worth £400; and received a civil pension of £300. In 1843 he succeeded Southey in the Laureateship, an office raised in dignity by 'him that utter'd nothing base.' Of him Wordsworth writes (July 1, 1845), 'I saw Tennyson when I was in London several times. He is decidedly the first of our living poets, and I hope will live to give the world still better things.' An almost unbroken felicity attended the last half of Wordsworth's life. 'What he gave to others, and what he most desired for himself,' says a friend, 'was love.' He felt for his friends and family, neighbours and dependents, for children, for the poor, that intense tenderness which his poetry expresses towards what, by a narrow phrase, we call Nature: till, with such Euthanasia as human life allows, 'old, yet unchill'd by age,' on April 23, 1850, the great soul made his calm and Christian transit to the spiritual world on which his thoughts had been long devoutly fixed. He had overlived the chilling want of sympathy which original genius never fails to arouse among commonplace minds; he had outlived the mis-estimation of some nobler spirits, and the overpartiality of undiscriminating worshippers; his work for his countrymen, wherever scattered over the world, was at length fairly judged, and found to rank in quality with the best to which England has given birth; and he now rests from his labours in the quiet churchyard of Grasmere, among neighbours and kinsmen, within the bosom of the hills he loved so heartily, and the Rotha running at his feet with a music not sweeter than his own.

Turning from the Man to the Poet: In our limited space we propose now to set forth Wordsworth's own views upon his art, and his aims: his chief characteristics: certain fallacies current regarding his work: with some notice of the poems as they mark the stages of his life and art. And we shall here rely greatly upon the criticisms which in the maturity of his and his friend's powers, Coleridge published in his *Biographia Literaria*, 1817.

To the second issue of his *Lyrical Ballads* (1800) Wordsworth added a Preface with an Appendix, the study of which, and of a somewhat later Essay, combined with Coleridge's analysis, we venture to press upon all readers who love Poetry wisely, as forming (despite certain doubtful propositions), the best suggestive outline of an Art of Poetry known to the writer. (Aristotle's treatise has reached us in a state too imperfect, and is too exclusively Hellenic in its range to be here in question.) Yet in the forefront of the Preface, Wordsworth laid himself fairly open to hostile criticism by bringing forward as the guiding principle of his poetry a too dogmatic insistence upon 'incidents and situations from common life, tracing in them . . . the primary laws of our nature,' to be related or described 'throughout, as far as was possible, in a selection of language really used by men.' The persons were 'generally' chosen from the labouring ranks, because 'our elementary feelings' are amongst them most simply shown, are capable of most forcible representation, and are 'incorporated with the beautiful and permanent forms of nature.' Hence also the language of these men, somewhat 'purified,' was used; being, from natural circumstances, simpler and truer: 'a more permanent, and far more philosophical language than that which is frequently substituted for it by the poets:' and he argues further that between the language of prose and poetry, (metre excepted), no definite barrier lies; 'poetic diction,' (probably with special reference to 18th-century writers), being carefully excluded from the poems before us.

This theory, as exemplified in the *Ballads*, raised a storm and shout of derision from the critics of the day, which long impeded Wordsworth's popular reception. And doubtless, although phrases occur which really limit the main argument, yet as Coleridge showed in his masterly analysis, Wordsworth assumed, 'in terms at once too large and too exclusive, his predilection for a style the most remote possible from the false and showy splendour which he wished to explode;' seeming, at first sight, to confine truth and simplicity of feeling and language to 'unsophisticated' man, and the incidents hence chosen: he overstated both the poetic possibilities of the speech of common life, and the importance of the conventional diction of the day.

Yet both in his own age and since critics exaggerated Wordsworth's positions. His final claim is only that by following his method, genuine poetry of permanent interest and moral value would be produced. And in fact it is but a small proportion of his poems, and those of early date, which are any way thus injured in effect. The general theory of poetical art fills most of the essays; and herein lies their great and lasting value. Pleasure, immediate, pure, durable, exquisite, but not exclusive of painful scenes, he lays down and brilliantly vindicates as always essential to Poetry; 'excitement in co-existence with an overbalance of pleasure:' whilst the worthiest objects of the art

are 'the external universe, the moral and religious sentiments of Man, his natural affections, and his acquired passions.' Thus Poetry to Wordsworth is 'the breath and finer spirit of all knowledge:' man and his environment are essentially adapted to each other; there is a kind of interplay between him and nature. Hence, in strict accordance with the common voice of the great poets of all ages, he says of himself 'I wish always to be considered as a teacher, or as nothing:' or, as he expressed it, his purpose was 'to console the afflicted; to add sunshine to daylight, by making the happy happier; to teach the young and the gracious of every age to see, to think and feel, and therefore to become more actively and securely virtuous: this is their office.'

This constant dealing with life, as Arnold has remarked, this 'energetic and profound treatment of moral ideas, is what distinguishes the English poetry,' and eminently that of Wordsworth. Yet in art, as in human life, narrow is the way to excellence. *Surgit amari aliquid:* even with the most poetical poet, the high lesson tends to become dominant over beauty; the moral supersedes pleasure. Wordsworth, to notice here his defects, has hence much that is simply didactic: his intense imaginative gift, his vivid sense of unity, saved him from the prosaic: the lion's grasp is hardly ever wanting: yet a certain heaviness often alloys his longer poems, whether those of meditative reasoning or of narration. In simple metres he has stateliness, he has exquisite sweetness: but he cannot compete with the effortless variety, the ethereal grace of Shelley's short lyrics; with Keats in the splendid wealth, the magnificent music of his odes. Not only is his style curiously unequal, but he had no consciousness of lapse: was at times diffuse and overminute in details: in common with almost every modern European poet, he wrote too liberally. He has images too lofty for the subject: 'not always graceful in the play of fancy,' says Coleridge: and especially in some early lyrics, is bald and even clumsy.

Yet some of these defects are near akin to great merits: and the mass of work equally admirable in art and precious in substance, which Wordsworth's eighty years have left us, distinctly places him, (if I may express my entire concurrence with Arnold's judgment), next, in sequence of time, to Milton. Other poets of his period may have been equally gifted; but he was allowed to gather in his whole harvest. Specially we may note his austere, logical, accurate purity and noble plainness in diction, 'impassioned, lofty, and sustained:' with the corresponding 'weight and sanity of the sentiments,' won not from books but fresh from the soul: frequent ingenious happiness of phrase, the *curiosa felicitas* of his favourite Horace: perfect truth, perfect modesty of painting, in his descriptions and images from nature:—so keenly noted and so numerous that, as Tennyson once remarked, 'he always seems to have been before one in observation.' Rising now to the inner spirit of the work, Wordsworth eminently was a merciful judge of his fellow-creatures, with the deepest inborn feeling for the poor, always tender to the ignorant and the erring, grieving 'for the overthrow of the soul's beauty.' Hence he abounds in 'a meditative pathos, a union of deep and subtle thought with sensibility; a sympathy with man as man. Such he *is*, and so he writes,' said Coleridge: who then challenges pre-eminently for him 'the gift of Imagination in the highest and strictest sense of the word.' In this 'he stands nearest of all modern writers to Shakespeare and Milton, and yet in a kind perfectly unborrowed and his own.'

On this singular imaginative power a few words must be added. As a child, Wordsworth's vivid mind unconsciously reproduced the famous ideal philosophy of Berkeley. 'I was often unable,' he writes, 'to think of external things as having external existence, and I communed with all that I saw as something not apart from but inherent in, my own immaterial nature. Many times while going to school have I grasped at a wall or a tree to recall myself from this abyss of idealism to the reality:'—And, shadowy and transient as these strange influences of the childish imagination necessarily were, they lay at the root of that peculiarly spiritual tone with which Wordsworth always looked on the world. When this 'visionary gleam' passed from the yet unconscious poet's eyes, the same imaginative faculty, taking a new but analogous form, presented the world to him as itself actually interfused with living power:

> He felt the sentiment of Being spread,
> O'er all that moves and all that seemeth still;—
> The presences of Nature in the sky
> And on the earth; the Visions of the hills,
> And Souls of lonely places.

Or again, when as a boy he was bird-chasing,

> —moon and stars
> Were shining o'er my head. I was alone,
> And seemed to be a trouble to the peace
> That dwelt among them.

Or once more, with profounder force still, we find him unhesitatingly speaking of

> The Being that is in the clouds and air,
> That is in the green leaves among the groves:—

The Omnipresence of God was surely never more deeply felt, or expressed more deeply.

This brief attempt to catalogue the gifts of exceptional genius is inevitably tentative; but Wordsworth has himself set forth his poetical aim in verse and prose: and high as the aim was, it is not too much to say that he came near as human limitations allow toward accomplishing it. Great force in thought, great power of imagination,—these, by natural law, are the primary elements whence all great poetry has sprung. The fountain of verse can never rise to a higher height,—can indeed never absolutely equal the height,—of the well-head of the poet's own nature. The workman is ever greater than the work. But those two capital gifts, like the elements of chemistry, are combined in various proportions to form the substance of the song: and in Wordsworth's case their union indubitably places him amongst the most spiritual, the most ideal, in the noble army of singers. Very unequal is his poetry; yet, everywhere, as if by natural necessity, even the lowliest themes are lifted to their loftiest meaning. It was his function 'to breathe Grandeur upon the very humblest face Of human life:'—

> The light that never was on sea or land,
> The consecration, and the Poet's dream,

in their degree, are constantly present.

This nobly meditative mood at once elevates and limits his range. 'Of all poets,' says Dean Church, 'Wordsworth made himself most avowedly the subject of his own thinking.' In the great partition between Objective and Subjective, he counts among the latter. Yet herein we find one of his most conspicuous and delightful characteristics. His subjectivity is itself objective. Speaking for himself, Wordsworth will be found to speak for all of us: it is the common human mind which he perpetually interprets. As if they had never been thought before, he gives back our own thoughts with an exquisiteness and a distinctness all his own:

> I've heard of hearts unkind, kind deeds
> With coldness still returning;
> Alas! the gratitude of men
> Hath oftener left me mourning.

Lines like these or descriptions of the same quality occur perpetually, and once read, are unforgettable.

If it be a vulgar error that ascribes egoism to Wordsworth's lofty meditative independence, no less is it palpably incorrect to hold him pre-eminently the poet of Nature. The wealth of his landscape, whether in fine details or in larger pictures, (closely analogous to the work of his great contemporary, J. M. W. Turner), is indeed inexhaustible; the delicate accuracy, the 'eye always upon the object,' never absent; and he is ever mindful that the 'forms Of Nature have a passion in themselves, that intermingles with those works of man To which she summons him.' Yet men, 'as they are men within themselves,' are his true theme: heroes and sufferers in lowly life; great characters of all ages; actors in the stormy scenes of war and politics during his youth. 'There is,' as he wrote of his poems, 'scarcely one which does not aim to direct the attention to some moral sentiment, or to some general principle, or law of thought or of our intellectual constitution.' 'He deals with life,' as Arnold puts it; 'and his greatness lies in his dealing with it so powerfully.'

Another, and at first sight a more tenable, error is that Wordsworth's later poetry falls greatly below the earlier: a common narrowness of human judgment from which Scott and other great writers have suffered. The undeniably fuller freshness of his first maturity, which is strongly marked in Wordsworth, seems to have blinded readers to the larger aim, the deeper sentiment, the sweeter truth, of work, perhaps less complete in art, less decorated, whilst essentially loftier. The Sublime, in a word, can never gain the popularity of the Beautiful.

It remains to complete, so far as possible, this imperfect sketch by a rapid view of the poetry itself in its main aspects. Four such may be noted.

I. The two early descriptive poems, in some degree, by diction and metre, remind us that they belong to the 18th century. Their style, as Coleridge observed, is powerful, but at times knotty and contorted; the images crowded to obscurity. Yet splendid lines occur, as when he represents the soul holding 'communion high' with God,

> There, where the peal of swelling torrents fills
> The sky-roofed temple of the eternal hills.

The *Guilt and Sorrow*, (1793–94), in its gloom recalls that darkened period of Wordsworth's life: but in the *Nay, Traveller*, (1795), we see already his exquisite inimitable touch in painting character and landscape. Wordsworth's single tragedy, *The Borderers*, follows. Action and variety are here too much suppressed in favour of analysis, as in other well-known instances of a poet's unpractised attempt in what is really another art than his own.

II. The four volumes of *Ballads and Poems*, between 1798–1800 and 1807, with the *Prelude*, form unquestionably the most important, the most charming body of Wordsworth's work. Among these are many poems in which admirable simplicity of feeling is joined to the happiest language and metre:—poems which, in their noble plainness deserve the fine praise of Matthew Arnold; 'Nature herself seems to take the pen out of his hand, and to write for him with her own bare, sheer, penetrating power.' Such are the simple tales from lowly life, pathetic or meditative, (*Ruth*, *Luey Gray*, the *Reaper*, the *Highland Girl*): tender love-poems, (*Three years, A slumber, She was a phantom of delight*): narratives or meditations in his very highest and purest manner, (*Tintern*, *The Brothers*, *Michael*): the lovely series of bird-pictures: many sonnets supreme in our sonnet-literature: ending with the *Ode on Immortality*, which a just judgment places also supreme among our reflective lyrics. The true balance between substance and art is here dominant: very few are the poems faulty from over-rusticity or over-elaborate language.

III. The *Excursion*, (1814), wherein the didactic element asserts itself too freely; the *White Doe*, (1815), idealism pure and exquisite in itself, yet, we must hold, pushed too far; two Odes on the Peace, somewhat overstrained and unlyrical, may open this stage of Wordsworth's mature life. But presently the poet, perhaps induced by the education which he was giving to his eldest son, broke new ground in the *Laodamia*, *Dion*, *Trajan's Pillar*: poems which have a unique character from the high spiritualism of their treatment. And with these may be joined the six odes to *Lycoris*, *September* and *May*: lovely at once in sunset glow, calm depth of feeling, and metrical skill. Here too fall the *Duddon* sonnets, Wordsworth's latest important study of the soul of landscape.

IV. The *Ecclesiastical Sonnets*, a singular monument of skilful historical narrative in that difficult form, though dating from 1820, may lead us to the poems of Wordsworth's genial old age. Here, whilst a serener pensiveness, a larger scope, is shown, and earlier faults of style avoided, we feel that the subjects are often less vividly conceived and handled. Yet here also not a few short pieces occur, even to the poet's last years, so felicitous in thought and rendering as to show that the mighty hand had not lost its ancient cunning.

Wordsworth's dearly loved and honoured wife had fifty years before given his name to a lofty peak near Grasmere; and the lines he dedicated to it may fitly figure both the poetry and the tenour of his later years.

> There is an Eminence,—of these our hills
> The last that parleys with the setting sun;
> We can behold it from our orchard-seat;
> And, when at evening we pursue our walk
> Along the public way, this Peak, so high
> Above us, and so distant in its height,
> Is visible, and often seems to send
> Its own deep quiet to restore our hearts.

Or, as the final motto to his life and work, we may take the words of his only eminent follower in poetry, and say with the author of the *Christian Year*,—*Ad sanctiora crigit*.

The chief editions of Wordsworth's poetry were the author's editions published by Moxon (6 vols. 1836–37, and 1849–50; 1 vol. 1845), the library edition edited by Professor Knight (8 vols. 1882–86), that in one volume by John Morley (1888), and the Aldine edition by Professor Dowden (7 vols. 1893). Among selections are those of F. T. Palgrave (1865), Matthew Arnold (1879), and that of the Wordsworth Society, edited by Professor Knight (1888). The prose works were collected by Dr A. B. Grosart (3 vols. 1876). The chief Lives are by his nephew [Bishop] Christopher Wordsworth (2 vols. 1851); F. W. H. Myers, in 'English Men of Letters' (1880); J. M. Sutherland (1887); Elizabeth Wordsworth (1891); and that by Professor Knight (3 vols. 1889). The most important criticisms are those of Coleridge, De Quincey, George Brimley, Sir H. Taylor, Bagehot, Clough, M. Arnold, Stopford Brooke, Lowell, Masson, E. Dowden, R. H. Hutton, Shairp, Aubrey de Vere, Leslie Stephen, Dean Church, and Swinburne. The Wordsworth Society's Proceedings fill eight parts (1880–88), but perhaps its best fruit was the volume entitled *Wordsworthiana* (1889). See also De Quincey's *Recollections of Lake Poets*, J. S. Cottle's *Early Recollections of Coleridge* (2 vols. 1837), *Memorials of Coleorton* (2 vols. 1887), H. Crabb Robinson's *Diary* (3 vols. 1869), Dorothy Wordsworth's *Tour in Scotland* (1874), and *Dorothy Wordsworth*, by Edmund Lee (1886); Professor Knight's *Through the Wordsworth Country* (1887), *The Lake District* (1878), and his edition of Wordsworth's prose works (1897); Emile Legouis, *La Jeunesse de William Wordsworth*, tracing the marked influence of William Godwin (1896). See also the articles COLERIDGE, SOUTHEY, WILSON (JOHN), and LAKE DISTRICT.

Dorothy Wordsworth, only sister of the poet, was born at Cockermouth on Christmas Day 1771. She set up housekeeping with her brother in the autumn of 1795 at Racedown Lodge in Dorsetshire, next at Alfoxden for a year (1797-98), enduring a noble poverty, then spent six months with him in Germany, and lived afterwards with him until the end at Grasmere and at Rydal Mount. His marriage in 1802 only widened the circle of her love. Her *Journals* kept at Alfoxden and Grasmere, and the records of her journeys in Scotland, the Isle of Man, Germany, France, Switzerland, and Italy, reveal a mind as subtly sensitive to nature as the poet's own, and an exquisiteness of expression, which, if he equalled, he never surpassed. Of her own choice she never married, but gave herself entirely for her brother, toiled and planned for him, and walked with him amongst the mountains beyond her strength to help him to see everything that could be turned to poetic use. She made herself a part not only of his life but of his imagination. But she had her reward in a love that never wavered, and that remains enshrined in some of the noblest verse in English literature. Hardly beautiful, bright-eyed and brown as a gypsy, she had a sweetness of nature, an intense sensibility to impressions, and a glowing heart that laid a spell on Coleridge, De Quincey, Charles Lamb, Crabb Robinson, and all who knew her. She had for some years shown signs of growing weakness, when in 1832 she had an attack of brain-fever from which she never entirely recovered. All hope of recovery was gone by 1836, yet she outlived her brother, and lingered till 25th January 1855. She was laid at the right side of his grave in Grasmere churchyard.

See the Lives of William Wordsworth; Dorothy Wordsworth's *Journals*, edited by Prof. Knight (2 vols. 1897); and Edmund Lee's study (1886; new ed. 1894).

Wordsworth, Christopher, youngest brother of the poet, was born at Cockermouth in Cumberland, June 9, 1774. From Hawkeshead grammar-school he passed in 1792 to Trinity College, Cambridge, and was elected a fellow in 1798. Successively rector of Ashby-with-Oby and Thirne in Norfolk (1804), dean of Bocking, Essex (1808), rector of St Mary's, Lambeth, Surrey, and of Sundridge in Kent (1815), he exchanged these two last livings for the rectory of Buxted-with-Uckfield, Sussex, in 1820. He was master of Trinity College, Cambridge, from 1820 until 1841, when he retired to Buxted, where he died, February 2, 1846. His best-known book is his *Ecclesiastical Biography*, a fine collection of selected and annotated lives (6 vols. 1809; 4 vols. 1839). His books, *Who wrote Icōn Basilikē?* (1824) and *King Charles the First the Author of Icōn Basilikē further proved* (1828), are learned if not conclusive. His *Christian Institutes* (4 vols. 1836) is a good selection from the writings of the great English divines.—Of his sons, the eldest, John Wordsworth, was born at Lambeth, July 1, 1805, became a fellow of Trinity College, Cambridge, in 1830, took orders in 1837, and was preparing an edition of Æschylus and a classical dictionary, when he was surprised by death, December 31, 1839.—The second son, Charles Wordsworth, was born at Lambeth, 22d August 1806, passed from a private school to Harrow in 1820, and thence in 1825 to Christ Church, Oxford, where he gained the college and university prizes for Latin hexameters (1827), and graduated with a first-class in 1830. While an undergraduate he had played in the first cricket-match and rowed in the first boat-race between the universities. In 1830 he became private tutor, among his first pupils being Gladstone and Manning, and in 1834 public tutor at Christ Church, and was ordained deacon in 1835; he did not proceed to priest's orders until 1840. From 1835 to 1846 he was second master at Winchester, and then till 1854 warden of the new Episcopal college at Glenalmond (q.v.) in Perthshire. In 1852 he was elected Bishop of St Andrews, and for years thereafter was one of the foremost figures in Scottish ecclesiastical life, which he did much to sweeten by his numerous writings in favour of reunion between the churches. He was one of the New Testament revisers. His many works include, among others, the well-known Greek grammar (first published in 1839); *Shakespeare's Knowledge and Use of the Bible* (1854; 4th ed. 1892), and *Shakespeare's Historical Plays* (3 vols. 1883); sermons, charges, and a collection of discourses and charges published as *Public Appeals on Behalf of Christian Unity* (2 vols. 1886); and the valuable *Outlines of the Christian Ministry* (1872; new ed. 1893). See his *Annals of My Life* (2 vols. 1891–93). He died 5th December 1892.—The youngest son, Christopher Wordsworth, was born at Bocking, October 30, 1807, and had his education at Winchester and Trinity College, Cambridge, where he carried off the Chancellor's medal for his poem, *The Druids* (1827), the Browne medals for the Latin ode and Greek epigram (1828), and graduated senior classic in 1830. He travelled in Greece in 1832–33, took holy orders, was elected fellow of his college in 1830, and in 1836 public orator to the university. He was an unsuccessful head-master of Harrow from 1836 till 1844, when he became canon of Westminster, was appointed vicar of Stanford-in-the-Vale, Berkshire, and rural dean in 1850, archdeacon of Westminster in 1865, and in 1868 was raised to be Bishop of Lincoln. He died at Lincoln, March 20, 1885, only a few weeks after resigning his see. His ideal of episcopal duty was high, but he lacked that breadth of view and of sympathy necessary to make a really great administrator. He was obstinate, incapable of seeing when he was in the wrong, and often harsh in phrase, but the singleness of his aims and his real nobility of character commanded the respect of all men. His *Athens and Attica* (1836), *Inscriptiones Pompeianæ* (1837), *Greece: Pictorial, Descriptive, and Historical* (1839; revised by H. F. Tozer, 1883), *Theocritus* (1844), and even *Conjectural Emendations* (1884) were sound contributions to classical scholarship. In 1842 he edited the *Correspondence of Bentley*, but he cannot in any sense be said to have achieved success in his Memoir (1851) of his illustrious uncle, the poet. Other works were his *Theophilus Anglicanus* (1843), Hulsean Lectures on the Canon (1848) and on the Apocalypse (1849); *S. Hippolytus and the Church of Rome in the Third Century* (1853); *The Greek New Testament* (1856–60); and *The Old Testament in the Authorised Version* (6 vols. 1864–71), a vast work of labour and research of the pre-scientific stage of such scholarship; *Miscellanies, Literary and Religious* (3 vols. 1878); and a *Church History to the Council of Chalcedon, 451* A.D. (4 vols. 1881–83); besides countless sermons and vigorous but one-sided controversial pamphlets and treatises on such questions of the day as baptism, secession to Rome, secular education, tithes, divorce, marriage with a deceased wife's sister, cremation, confession, Wesleyanism, sisterhoods, future punishment, the Revised Version, &c. See the Life by J. H. Overton and E. Wordsworth (1888).—The eldest son of the last, John Wordsworth, was born at Harrow, September 21, 1843, had his education at Ipswich, Winchester, and New College, Oxford, graduated with a classical second class in 1865, and carried off the Chancellor's prize for Latin essay (1866) and the Craven scholarship (1867). For a short time assistant-master at Wellington College, he became a fellow of Brasenose College, Oxford, in

1867, and served as tutor from 1868 till 1883. He was a prebendary of Lincoln (1870–83), examining chaplain to his father (1870–85), Grinfield lecturer on the Septuagint (1876), Bampton lecturer—*The One Religion* (1881), and from 1883 the first Oriel professor of the interpretation of Scripture (with canonry of Rochester attached). In 1885 he was raised to be Bishop of Salisbury. His chief books are *Fragments and Specimens of Early Latin* (1874), *University Sermons* (1878), *Old Latin Biblical Texts*—I. (1883; vols. ii. and iii. mainly by other scholars), and a critical edition of the Vulgate New Testament (parts i.–ii. 1889–90). He had a share also in the first series of the Oxford *Studia Biblica* (1885).

Work. See DYNAMICS, ENERGY, FORCE, HORSE-POWER, MOTION, POWER.

Work. HENRY CLAY, song-writer (1832–84), born at Middletown, Connecticut, attracted notice during the American civil war by his war-songs, of which 'Marching through Georgia' is best known. Of nearly a hundred songs of his the most popular were 'Lily Dale' and 'My Grandfather's Clock.'

Workhouse. See POOR-LAWS, p. 314.

Workington, a municipal borough and seaport of Cumberland, at the mouth of the Derwent, 7 miles N. of Whitehaven by rail. Its harbour, furnished with a breakwater (1873) and several quays, is safe and commodious; and there are nearly 100 vessels, some of them of 250 tons burden, belonging to the port. To the coal-mines in the vicinity the town chiefly owes its prosperity, great quantities of coal being exported: and there are large ironworks and other industrial establishments here. A large Sheffield steel foundry was transferred hither, on account of the cost of transit to the seaside, in 1883. The salmon-fishery near is important. Mary Queen of Scots landed here, on her flight from Langside, 16th May 1568, and was entertained at Workington Hall (the seat of the Curwens from about 1160 till the present day). Workington was incorporated by royal charter as a municipal borough in 1888. Pop. (1881) 14,109; (1891) 23,522.

Works, BOARD OF. In 1806 the management and control of public works and buildings, of which the expenses are defrayed from the crown revenues or parliamentary grants, were entrusted to an officer called the Surveyor of His Majesty's Works and Public Buildings. In 1832 the duties of this officer were transferred to the Commissioners of Woods, Forests, and Land Revenues (see WOODS AND FORESTS); but this arrangement eventually resulted in a complaint that the crown revenue was applied too easily to the execution of public works and improvements, and that parliament was unable to exercise proper control. The department of Public Works was therefore again separated, in 1851, from that of the Woods and Forests, and placed under the management of a new Board, called the Board of Works and Public Buildings, composed of a First Commissioner, who is a political officer, and sometimes has a seat in the cabinet, together with the Secretaries of State, and the President and the Vice-president of the Board of Trade, who are *ex-officio* commissioners. In addition to the control over public works and buildings possessed by the former united Board, the Board of Works took over the management of certain parks (including Richmond, Greenwich, Bushy, Phœnix, and Holyrood Parks), and public gardens (such as Kew and Hampton Court). The Board has some responsibilities in connection with the national buildings and collections. The Board of Works is under control of the Treasury, to whose sanction all large estimates for public works must be submitted. The Treasury appoint the secretary, clerks, and other officers of the establishment; and with the sanction of the Treasury the Commissioners appoint or employ such architects, surveyors, &c. as may be necessary. The Metropolitan Board of Works was founded in 1855, with very extensive and various powers as to London (sewerage, fire brigades, gas and water supply, Thames Embankment, bridges, ferries, tunnels, subways, street improvements, supervision of buildings, artisans' dwellings, tramways, music halls, &c.); but the London County Council took over in 1889 its innumerable duties, and the Metropolitan Board of Works ceased to exist.

Workshop Acts. See FACTORY ACTS.

Worksop, a town of Nottinghamshire, on the river Ryton and the Chesterfield Canal, 16 miles ESE. of Sheffield and 23 N. of Nottingham. It lies near the northern extremity of Sherwood Forest (q.v.), in a district known as the 'Dukery,' from the number of ducal seats. There is Worksop Manor, in whose predecessor (destroyed by fire in 1761) Mary Queen of Scots was a prisoner under the Earl of Shrewsbury, and which, formerly a seat of the Duke of Norfolk, was purchased in 1840 for £350,000 by the Duke of Newcastle. His, too, is Clumber Park (q.v.); and there are also Welbeck Abbey (q.v., Duke of Portland) and Thoresby Park (till 1773 Duke of Kingston, now Earl Manvers). Worksop church was that of an Augustinian priory (1103), of which there is also a Decorated gateway, but a Norman keep has vanished. Modern buildings are the corn exchange (1854), Venetian in style, and the Mechanics' Institute (1852). Malting is the chief industry, with brass and iron founding, and manufactures of chemicals, agricultural implements, &c. Pop. (1851) 7058; (1891) 12,734. See works by J. Holland (1726), R. White (1875), and Sissons (1888).

World in the widest sense means the universe, the whole system of created things (as contradistinguished from God). In this sense the world, and facts and problems in regard to it, are discussed at ASTRONOMY and other articles cited there (such as SOLAR SYSTEM, STARS, COMETS, ETHER, &c.), CREATION, COSMOGONY, DARWINIAN SYSTEM, and in many of the articles on philosophical and theological systems, such as PANTHEISM, NEOPLATONISM, &c. In the narrower sense it means the terraqueous globe, discussed in its physiographical relations in the article EARTH, where are described its figure, dimensions, mass, mean density and constitution, its surface, movements, the distribution and work of solar energy. The areas in detail of the great land-divisions of the world will be found under CONTINENTS. As to the population of the earth Wagner and Supan in the *Bevölkerung der Erde* for 1891 give the following estimates:

Europe (without Iceland, Atlantic islands, &c.)	357,379,000
Asia (without the Polar islands)	825,954,000
Africa (without Madagascar, &c.)	163,953,000
America (without Polar regions)	121,713,000
Australia and Tasmania	3,230,000
Oceanic Islands	7,420,000
Polar Regions	80,000
Total	1,479,729,000

The following table shows approximately the numbers professing the chief faiths of the world:

Buddhists	500,000,000
Hindus	160,000,000
Mohammedans	155,000,000
Confucians	80,000,000
Adherents of Shintoism (in Japan)	14,000,000
Jews	7,000,000
Christians—	
Roman Catholics	152,000,000
Greek Catholics	75,000,000
Other Christians	100,000,000
Various Heathens	237,000,000
	1,480,000,000

See also the articles CHRONOLOGY, ETHNOGRAPHY, GEOGRAPHY, GEOGRAPHICAL DISTRIBUTION, GEOLOGY (for the age of the Earth, see there at p. 154), MAN (for the antiquity of the human race), POPULATION, and books cited at VITAL STATISTICS.

Worm Grass. See SPIGELIA.

Worms, an ancient and interesting town of Hesse-Darmstadt, in a highly fruitful district on the left bank of the Rhine, 25 miles SW. of Darmstadt by rail. Among its churches the chief is the cathedral, a massive Romanesque building in the Byzantine style, with two cupolas and four towers, founded in the 8th, rebuilt in the 11th and 12th centuries, and carefully restored in the last quarter of the 19th century. On a hill near the church called the Liebfrauenkirche a highly esteemed wine, called *Liebfrauenmilch*, is grown. The synagogue is one of the oldest in Germany. The town-house was restored in 1884. There are manufactures of soluble glass, soap, bone-dust, printing and other machinery, and furniture; the making of patent leather employs 1200 hands; tobacco is also manufactured, and a trade in the wines and the agricultural produce of the vicinity is carried on. The town has a busy river port. Pop. (1880) 19,005; (1895) 28,624 — 8700 being Catholics. Worms is one of the oldest cities of Germany (though held by the French in 1801–14); in it is laid the scene of the Nibelungenlied (q.v.). It was occupied by the Romans, made their capital by the Burgundians, destroyed by Attila, and rebuilt by Clovis. It was frequently the residence of Charlemagne and his successors, and was the place of convocation of many German diets, including that of 1521, at which Luther defended himself before Charles V. and the princes of the empire, commemorated by an imposing monument to Luther erected at Worms in 1868. It was an imperial free city, and its bishopric was all but a separate state. The industry and commerce of Worms were great during the middle ages, and its population, as far back as the time of the Hohenstaufens, averaged 60,000, and amounted to 30,000 even at the close of the Thirty Years' War; but it was almost wholly destroyed by the French in the destructive war of 1689, and, though soon after it was rebuilt on a smaller scale, it has never recovered its former prosperity. Here, in 1743, an offensive and defensive alliance was entered into by Great Britain and Austria with Sardinia.

Worms, or VERMES, a term destitute of scientific precision, but often applied to the members of numerous classes of invertebrate animals which are more or less earthworm-like in appearance. It is little more than a convenient name for a shape, for among the forms called 'worms' the variety of internal structure is so great that no common characters can be noted beyond the general occurrence of bilateral symmetry. The numerous classes include many types of much interest on account of the affinities which they present to other types of animals. The higher forms, known as Annelids, consist of a series of homologous segments; the lower forms are unsegmented. In the present state of our knowledge as to the affinities of 'worms,' all that can be attempted here is to give a catalogue of the various classes, arranged in a manner which cannot pretend to be more than provisional.

- **Plathelminthes or Scolecida (Flat-worms).**
  - Turbellaria.—Small 'worms,' usually aquatic, often known as Planarians (q.v.)—e.g. Planaria, Convoluta, Vortex.
  - Trematoda.—Parasitic 'flukes'—e.g. Distomum. See FLUKE.
  - Cestoda.—Parasitic 'tapeworms'—e.g. Tænia. See TAPEWORM.
  - Nemertea.—Free-living aquatic worms—e.g. Nemertes, Lineus. See NEMERTEA.
- **Nemathelminthes (Round-worms).**
  - Nematoda.—Thread-worms, some free, most parasitic—e.g. Ascaris (q.v.), Trichina (q.v.), Gordius. See THREAD-WORMS, &c.
  - Acanthocephala.—Parasitic. Echinorhynchus (q.v.).
- **Annelida**
  - Discophora, or Hirudinea. Leeches—e.g. Hirudo. See LEECHES.
  - Chætopoda.—Bristle-footed Annelids. (1) Oligochæta—Earthworms (q.v.); (2) Polychæta—marine worms, both free-swimming and sedentary—e.g. Nereis, Aphrodite (see SEA-MOUSE), Arenicola (Lobworm), Serpula; (3) Echiuridæ, bristly 'Gephyreans'—e.g. Echiurus, Bonellia. Related types, (*a*) Archi-annelida—primitive forms—e.g. Polygordius, and (*b*) Myzostomata, parasitic on Crinoids.
  - *Incertæ sedis*, perhaps related to Chætopods—(1) Chætognatha—e.g. Sagitta (q.v.), (2) Rotatoria (q.v.), or Rotifera.
- **Vermes Incertæ Sedis.**
  - Sipunculoidea—e.g. Sipunculus (q.v.).
  - Phoronidea—Phoronis.
  - Polyzoa, or Bryozoa. See SEA-MAT.
  - Brachiopoda (q.v.), or LAMP-SHELLS.

Worms as a Disease of Childhood.—The articles dealing with Ascaris, Cestoid Worms, Tapeworm, Thread-worms, Parasitic Animals, and Vermifuges treat of the natural history of the worms infesting the human subject, and of the remedies to be employed for their expulsion, so here need only be noticed the symptoms which are usually considered to be indicative of the presence of worms in children. These symptoms are, however, in reality, only evidence of irritation of the mucous membrane of the intestinal canal, which may be due to other causes than worms, as, for instance, the presence of indigestible matter, unhealthy secretions, or the existence of a morbid condition of the membrane itself. 'Perhaps few of the symptoms—and they are very numerous—which are found while worms exist in the body can be directly attributed to the presence of these parasites, as they may all of them, or nearly all, be found also in cases where repeated purgatives have convinced us that worms are absent. They are therefore probably due in great part to the abdominal derangement which favours the development of the entozoa' (Eustace Smith, *Wasting Diseases of Children*, 4th ed. p. 231). Although then the symptoms commonly referred to the presence of worms may exist without them, yet there is a group of symptoms which, when occurring together, should, at all events, excite our suspicions. These symptoms are divisible into two groups. The first, those dependent directly on the presence of worms in the intestines, comprise loss of flesh; appetite capricious, sometimes excessive; pain or discomfort in the abdomen; irregular action of the bowels and much mucus, sometimes blood, in the stools. The second group comprises the symptoms connected with the sympathetic relations of the digestive organs, and due to some form of reflex nervous action, and amongst the most marked of them are those of the head. The sleep becomes unquiet, and the little patient is liable to start up suddenly from slumber; grinding of the teeth is common; the pupils are often dilated, and there may be headache, and sometimes convulsions—symptoms painfully like those of Hydrocephalus (q.v.), but often disappearing on the expulsion of worms. Itching of the nose is frequently present. A dry cough, unaccompanied by any signs of disease of the thoracic organs, is regarded as a sympathetic or reflex symptom of worms; and vomiting and hiccough often accompany their presence.

The Round-worm (*Ascaris lumbricoides*) may be present in the small intestine (its ordinary seat) in large numbers without occasioning any disturbance; but when symptoms are present

the most prominent are sharp colicky pains about the navel, nausea, faintness, and other nervous disturbances. The Tapeworm (Tænia) may also cause pain in the belly; emaciation is sometimes very marked, but reflex disturbances are less common than in the case of round-worms. The Thread-worm (*Oxyuris vermicularis*) chiefly occurs in the large intestine, where it often exists in large numbers, looking like bits of cut thread. In a recently voided stool they are seen to be in rapid motion; hence they are called Ascarides (from the Greek *askaridzein*, 'to jump'), and hence also, in all probability, the great local irritation which they occasion as compared with the quiet round-worms. The characteristic sign of the presence of these thread-worms is the itching and irritation felt at the anus. Other parasitic worms, as Bilharzia, Guinea-worm, and Trichina, are separately discussed. The worms by which Herod was eaten are interpreted to mean a kind of lice (*Pediculus tabescentium*; see LICE), credited with multiplying with awful rapidity and burrowing in the flesh.

The 'worms' implied in worm-eaten furniture or books are rather insects or their grubs; see BARK-BEETLES, BOOKWORM, BORERS, BORING-ANIMALS.

The *Worms of the Dog* belong principally to the two classes Nematoda or round-worms and Cestoda or tapeworms. The commonest round-worm is *Ascaris marginata*, infesting stomach and intestines; *Dochmius trigonocephalus*, also found there, and *Trichocephalus depressiculus*, or whip-worm (in the cæcum), are of less importance. Other round-worms are *Filaria immitis*, found in the heart, and *Strongylus gigas* in the kidneys. The latter, though the largest of the Nematodes, does not always cause inconvenience to the host; sometimes, however, there has been continual wasting of the flesh; in other instances great pain has been manifested by howling night and day; and in some instances the urine has contained blood or purulent matter, and the dog has been observed to walk with its body curved to the affected side when the worm is in one kidney only.

The tapeworms are well known to infest two hosts. In the herbivora they are found in the embryonic or cystic stage, and then appear as bladders containing fluid (bladder-worms). The most common in Britain are (1) *Tænia cœnurus*, which infests the intestines of the dog in its mature stage, whilst the cystic form, the *Cœnurus cerebralis*, is found in the brain of the sheep, sometimes that of cattle, very rarely in the brain of the horse. (2) *Tænia serrata* ('sawlike') is found in the larval or cystic form (*cysticercus pisiformis*) in the peritoneal cavity of hares and rabbits; these are eaten by the dog, and arrive at the mature stage in the intestines of that animal; the segments of the worm, as is the case with other tapeworms, are expelled with the fæces of the host, and the ova or eggs which they contain escape and are scattered over the grass, which is eaten by the herbivorous host, and there become hatched. (3) *Tænia echinococcus* is, in the mature stage, a very small tapeworm, but in its embryonic form it attains large dimensions, and is called the *Echinococcus veterinorum*, and is found in the liver, lungs, kidneys of man, the Ruminantia, and the pig. It is very prevalent and destructive to human life in Iceland. (4) *Tænia cucumerina* ('cucumber-shaped') is a small but long tapeworm, the segments of which when mature escape from the intestines and discharge their ova on the skin of the dog, and are there eaten by the dog-louse, *Trichodectus latus*, or dog-flea, *Pulex seriatieeps*, in the bodies of which the ova are hatched and assume the cystic form. The fleas and lice irritate the skin of the dog, who in hunting for them with his teeth swallows some of them and the contained ova, which become hatched and assume the mature form in its intestines. In this way the presence of this tapeworm in sucking puppies is accounted for. (5) *Tænia marginata* is the largest tapeworm found in the dog, and is the mature form of the *cysticercus tenuicollis* which is found in the peritoneal, pleural, and even in the pericardial sac of various animals, particularly the Ruminants. In addition to the above the following Tænia are sometimes found in the dog: *Tænia krabbei*, *T. serialis*, and *T. litterata*; and another form of tapeworm, called the *Bothriocephalus latus*—which also exists in man—the cystic stage of which is found in fish, particularly the pike and burbot; and in Greenland a shorter species of this worm is found in the dog and once only in man. As to *treatment*, for tapeworms areca nut and the oil of the male shield fern, succeeded by a purgative, and for round-worms santonin, succeeded by a purgative, are the most reliable remedies.

A worm is found in the nasal cavities of the dog called *Linguatula tænoides*, and is classified under the Arachnida. Its presence causes irregular fits of sneezing, difficult inspirations, and a discharge of mucus, containing ova, from the nose.

Worm-seed is the popular name for santonica, from which Santonin (q.v.) is extracted.

Wormwood is the popular name for *Artemisia absinthium*, the genus Artemisia, belonging to the Compositæ, being a very numerous one, found especially in the dry regions of the northern hemisphere. There are forty species found in the United States. The Common Wormwood of Britain (*A. absinthium*) not only acts as an anthelmintic, as its name implies, but it likewise possesses tonic and stimulant properties. An infusion of wormwood, made by pouring a pint of boiling water over an ounce and a half of the dried plant, letting it stand for an hour, and straining, taken in doses of a couple of ounces once or twice a day, is a very good domestic tonic, and may be prescribed with advantage even in cases where worms are not suspected. The genus is a large one, the qualities of the wormwood being pretty uniformly present in all. Some of the species, especially *A. glacialis* and *A. mutellina*, natives of Switzerland, are used in the manufacture of Absinthe (q.v.). Tarragon (*A. dracunculus*) imparts the fine aroma to the vinegar of that name.

Wormwood (*Artemisia absinthium*).

Wormwood Scrubs, a district with a common, a railway station, and a prison, on the western outskirts of London, nearly 3 miles NW. of the Marble Arch in Hyde Park.

Wornum, RALPH NICHOLSON, the founder of scientific art criticism, was born at Thornton, Northumberland, 29th December 1812, and, having since 1853 been keeper and secretary of the National Gallery, died at Hampstead, 15th December 1877.

Worsaae, Jens Jacob Asmussen, Danish archæologist, was born at Vejle in Jutland, 14th March 1821. From the gymnasium of Horsens he proceeded to Copenhagen, where, soon abandoning the study of first divinity and then law, he turned his whole attention to the history and archæology of the north, and from 1838 to 1843 was assistant in the Royal Museum of Northern Antiquities. Between 1842 and 1854, when he was nominated to the honorary rank of professor in the university of Copenhagen, Worsaae made repeated visits to the other Scandinavian lands, to Great Britain, Germany, France, and other parts of central Europe, which retained traces of the former presence of the Northmen. These journeys, whose cost was largely defrayed by the Danish government, bore fruit in numerous works and papers of interest, three of which have been translated into English as *Primeval Antiquities of England and Denmark* (1849), *The Danes and Norwegians in England* (1852), and *Pre-history of the North* (1886). Somewhat inclined to exaggerate Scandinavian influences, Worsaae always showed himself an ardent patriot, and a strenuous opponent of the spread of German tendencies in the duchies, and his views in this direction were forcibly enounced in his *Jylland's Danskhed* (1850), especially directed against Jacob Grimm's exposition of the question of German national law. His merits were fully recognised by his countrymen; and the Danish government constantly showed its sense of the estimation in which he was held by placing him at the head of archæological commissions, and by appointing him to important posts in connection with the University and Antiquarian Museums. He was minister of education, 1874–75, and died near Holbäk in Zealand, 15th August 1885.

Worsborough, a town in the West Riding, 2½ miles S. of Barnsley, with manufactures of iron, glass, paper, gunpowder, &c. Pop. (1891) 9905.

Worsted. See Wool.

Wörth, a village (pop. 1064) of Alsace-Lorraine, about 10 miles SW. of Wissembourg (Weissenburg), where, on the 6th August 1870, the French were defeated by the Germans (see France, p. 782). The French call the battle Reichshofen.

Worth, Charles Frederick (1825–95), costumier, born at Bourn in Lincolnshire, went to Paris in 1846, and started an establishment for the making of fashionable costumes. He achieved great success as a designer of fashions, and his establishment in the Rue de la Paix came to be regarded as the first emporium for the latest Paris fashions, employing not much short of a thousand workwomen, four-sevenths of them inside, and the rest outside. M. Worth was himself the designer of the styles which emanated from his establishment.

Worthing, a fashionable watering-place on the Sussex coast, 10½ miles W. by S. of Brighton and 56 SSW. of London. It has risen from a small fishing-village since 1760, its growth being rapid after visits of the Princess Amelia (1797) and the Princess Charlotte (1807). The climate is much milder than that of Brighton, the town and its immediate neighbourhood being encircled on the north and north-east by the Downs, which shelter it from cold winds, and render it one of the best winter-resorts on the south coast. There are capital sands, a parade 1½ mile long, a public park of 18 acres (1881), and an iron pier (1862) 320 yards long. Fruit-growing is carried on to a considerable extent, many acres of land being covered with glass structures. Worthing was constituted a municipal borough in 1890. Pop. (1851) 5370; (1881) 11,821; (1891) 16,606.

Wotton, Sir Henry, traveller, diplomatist, scholar, and poet, was born of ancient family at Boughton Malherbe in Kent in 1568. He had his education at Winchester, and first at New College, then Queen's College, Oxford, and in his twentieth year proceeded master of arts. He stayed two years at Oxford adding to his great wit the ballast of learning and knowledge of the arts, then set out for a nine years' sojourn in France, Germany, Rome, Venice, and Florence. At Oxford he had begun a life-long friendship with Donne; at Geneva he made the familiar acquaintance of Beza and Isaac Casaubon; and on his return Essex admitted him to his intimacy. On his friend's downfall he betook himself to France, next to Italy, and was sent by Ferdinand, Duke of Florence, on a secret mission to King James VI. of Scotland with intelligence of a plot against him, and the Italian antidotes against poison. James on his succession to the throne of England summoned him from abroad, knighted him, and sent him ambassador to Venice (1604). Here he lived throughout the struggle with the court of Rome, and it was through his hands that Sarpi's famous history of the Council of Trent was communicated sheet by sheet to King James. After eight years he almost lost the king's favour owing to the publication by the scurrilous controversialist Scioppius, to the discredit of Protestant princes, of an epigram he had once written carelessly in a friend's album in Germany: *Legatus est vir bonus peregrè missus ad mentiendum Reipublicæ causa*, which Walton says Sir Henry Wotton could have been content should have been thus Englished: 'An Ambassador is an honest man, sent to lie abroad for the good of his Country.' But unfortunately the Latin did not leave a means of escape by the loophole of ambiguity. The king, however, was satisfied with Wotton's apology, saying that he 'had commuted sufficiently for a greater offence.' He was employed continuously for nearly twenty years, chiefly at Venice, next sent to several of the German princes and the Emperor Ferdinand II., returning to England a poor man in 1624, the year before the death of King James. He was made Provost of Eton, and entered into holy orders with all convenient speed. Here for fifteen years he lived, his days gliding past in quiet study and meditation, in encouraging the studies of the more hopeful youth, in cheerful conversation with his friends, and in angling, which he called his 'idle time not idly spent.' He meant to write the Life of Luther, but at the request of Charles I. applied himself to the history of England, and had indeed begun his task when he died 'in great tranquillity of mind and in perfect peace with God and man,' December 1639. He was buried at Eton under a plain gravestone, whereon was written by his own desire this prudent pious sentence to discover his disposition and preserve his memory: 'Here lies the first author of this sentence, "The Itch of Disputation is the scab of the Churches"' (*Disputandi pruritus ecclesiarum scabies*). Another of his sayings, and one more original than this, was his advice to a young diplomatist, 'that, to be in safety himself, and serviceable to his country, he should always, and upon all occasions speak the truth (it seems a State-Paradox), for, says Sir Henry Wotton, you shall never be believed; and by this means, your truth will secure yourself, if you shall ever be called to any account; and 'twill also put your Adversaries (who will still hunt counter) to a loss in all their disquisitions and undertakings.'

Wotton's tracts (including a treatise on Architecture and a Life of Villiers, Duke of Buckingham), letters, &c. were collected as *Reliquiæ Wottonianæ* (1651), prefaced by Izaak Walton's exquisite biography in miniature. The poem on a happy life is known to all lovers of good English. See *Sir Henry Wotton*, by A. W. Ward (1897).

Woulfe's Bottles. See Wolffian Bottles.

Wounds may be defined to be divisions of soft parts, including the skin, produced by external mechanical force. They are generally divided into (1) *incised wounds*, such as cuts or incisions, including those which remove a portion of the body; (2) *punctured wounds*, such as stabs; (3) *contused wounds*, in which the divided parts are bruised or crushed; (4) *lacerated wounds*, in which there is tearing of the tissues; (5) *poisoned wounds*, in which some poison or venom is inserted.

Simple, open, incised wounds will be more fully noticed than any of the others, because they have been most fully studied, and in their surgical relations are the most important. In a clean cut, whether made accidentally or in a surgical operation, three things are chiefly to be observed—viz. the opening or gaping by the retraction of their edges, the bleeding, and the pain. The *gaping* of a wound is caused by the retraction of the various tissues which are divided. Of the various tissues the skin exhibits the greatest degree of retraction, and then (in the order in which they stand) elastic tissue, cellular or connective tissue, arteries, muscles, fibrous tissues, nerves, and cartilages. In addition to the immediate gaping of fresh wounds, many wounds, if they be not prevented, will continue to retract for a long time. For example, in stumps that heal slowly the limb terminates in a cone, in consequence of the prolonged retraction of the muscles. The *bleeding* from an incised wound depends chiefly on the size and number of the divided vessels, and on their connection with the surrounding parts, but to a certain extent on the previous condition of the wounded part, or on the peculiar constitution of the patient. Gradually, with or without surgical help, the vessels cease to bleed; and then, if the wound be left open, there is an oozing of blood-tinged serous fluid, succeeded gradually by a paler fluid which collects like a whitish film on the surface, known as *lymph* (see under INFLAMMATION), and contains an abundance of white or colourless blood-cells, imbedded in a fibrinous (and therefore spontaneously coagulating) fluid. The nature of the *pain* cannot be made clear by any description to those who have not felt it; and it is more than probable that a similar wound inflicted on two or three persons would occasion different degrees of pain in each. There are also differences in both the kind and degree of pain, according to the place and manner of the wound. The skin is more sensitive than the deeper parts; that of the face, hands, and feet more sensitive than that of most other parts of the body. The *local consequences* of an incised wound are indicative of inflammation. In the course of an hour or more the edges of the wound and the adjacent parts become swollen and abnormally sensitive, feel hot and aching; the sutures (if any have been inserted) become tighter, and the edges and intervening spaces gape in consequence of the swelling. These symptoms gradually subside in two or at least four days, unless there is some abiding source of irritation. Except in very severe wounds, no *general consequences* are apparent. In these exceptional cases, as in amputations, for example, a Shock (q.v.) and subsequent reaction are observed. The duration of this feverish reaction or traumatic fever does not seem to bear any fixed relation to the severity of the injury. Sometimes it subsides within twenty-four hours; more often, after large wounds, it does not subside for three or four days. If constitutional disturbance should last more than four or five days after the receipt of the injury, there is probably some persistent irritation or some morbid complication.

The *healing* of open incised wounds may be accomplished, according to most surgical authorities, in five different ways: (1) *Healing by immediate union* takes place when the wounded parts being placed and maintained in contact first stick together, and then become continuous, without the formation of any new material as a connecting medium. For example, a flap of skin is raised by dissection in the removal of a tumour or a mammary gland, and is then replaced on the subjacent parts. In three days at most the union may be complete, without any indication of inflammation, there being no evident efflux of blood, no exudation of reparative material, and no scar. (2) In *healing by primary adhesion* lymph exudes from both cut surfaces, becomes organised, gradually connects the cut surfaces, and at length forms between them a firm layer of connective tissue, covered with a thin shining cuticle. These steps are well seen after the operation for hare-lip, for example. These two methods are known as healing by *first intention*. (3) *Healing by scabbing*, or under a scab, is the most natural and in some cases the best of all the healing processes. In animals it is often observed that if a wound be left wide open the blood and other exudations dry on its surface and form an air-tight covering, under which scarring takes place, and which is cast off when the healing is complete. In man this process is less frequent, because, in the first place, exudations seem to be more often produced under the scab, which detach it and prevent the healing; and secondly, surgical interference seldom allows this method to have a fair trial. The first three methods are obviously the most desirable, and should be aimed at whenever it is possible to do so. (4) In *healing by granulation* or *second intention* the wound becomes coated over with a film of lymph, which, if the wound be left open, increases, becomes reddened by the development of blood-vessels within it, and is transformed into granulations. We cannot enter into the life-history of these granulations, and can only remark that they are finally developed into a scar consisting of fibro-cellular or connective tissue, with a superficial layer of epidermis. The completion of the healing is accomplished by the gradual improvement of the scar, in which the connective tissue becomes more perfect in its character, and the cuticle becomes thicker and more opaque. (5) *Healing by secondary adhesion*, or by *third intention*, is accomplished by the union of two granulating surfaces (e.g. those of two flaps after amputation) placed and maintained in contact.

In the treatment of incised wounds there are four main points to be attended to: (1) Arrest of hæmorrhage, by pressure with the finger or a pad of lint, by cold, or, if arteries of any size have been divided, by their ligature or torsion (see BLEEDING). (2) Removal of any foreign bodies which may have been introduced. (3) Accurate apposition of the sides and edges of the wound by pads and bandages, by plasters, or by Sutures (q.v.), according to the size and position of the wound and the degree of gaping which has to be counteracted. (4) Prevention of decomposition in the wound and its discharges (see ANTISEPTIC SURGERY).

Of the other varieties of wounds it is sufficient to notice the most important points severally peculiar to each variety. Of *punctured wounds* the most serious are those which are made with blunt-pointed instruments, such as nails, pitch-forks, iron spikes, &c., for by these the injured parts are not so divided as that they may retract, but are pressed aside with much bruising, and can close again as soon as the instrument is withdrawn; and in this lies the chief danger of these wounds, because blood or other fluids are likely to extravasate into them, and cannot readily escape. These fluids, by decomposing

or by mere pressure, may excite inflammation, and thus cause deep and confirmed suppuration and great destruction of tissues. *Contused and lacerated wounds* are much more severe and dangerous than incised wounds of the same size, because the adjacent tissues are bruised and injured, and sloughing is very apt to occur. Such wounds on the limbs, if extensive, often necessitate amputation. If union is to be attempted, the rules given for the treatment of incised wounds must be followed, especial attention being paid to their careful cleaning, the removal of clots of blood, and their warm covering with some soft material, as cotton-wool. In no cases is careful antiseptic treatment at first of more importance or of more signal benefit than in severe wounds of this class. *Gunshot wounds* are merely a special group of contused and lacerated wounds, which from their great importance in military surgery have a large literature of their own.

Of *poisoned wounds* the most important are the bites of Snakes (q.v.) and other venomous reptiles, the stings of insects, the bites of rabid animals (see HYDROPHOBIA), and Dissection Wounds (q.v.). See also VENOMOUS BITES.

In conclusion it must be mentioned that various kinds of wounds are liable to certain complications, of which some are local and others general or constitutional. Among the former are recurring or secondary bleeding, pain, spasmodic muscular movements, and the presence of foreign bodies; whilst the latter include defect or excess of reaction, traumatic delirium, fever, erysipelas, pyæmia, tetanus, &c. Some of these complications are treated of in special articles of this work; and for the treatment of the remainder we must refer to Holmes's *System of Surgery*, or other standard works.

Woundwort. See STACHYS.

Wouverman, PHILIP, a Dutch painter of battle and hunting pieces, was born in May 1619 at Haarlem. From his father, Paul Wouverman, a historical painter, he inherited a taste for art. He studied first with his father, and afterwards with John Wynants. He passed his entire life at Haarlem in the assiduous practice of his art, and died 19th May 1668. Though his pictures are now highly valued, he is said to have had little immediate success, and to have lived in poverty, pretty much in the hands of the picture-dealers. His pictures are, for the most part, landscapes of small size, with figures profusely introduced, commonly in energetic action. His cavalry skirmishes, with a white horse generally in the foreground, are greatly admired for their spirit and vigour. He had two brothers, also painters, PETER (1623–82) and JAN (1629–66), who executed subjects somewhat similar, and whose works have not unfrequently been attributed to him; but, though both artists of considerable merit, they are plainly much inferior to Philip.

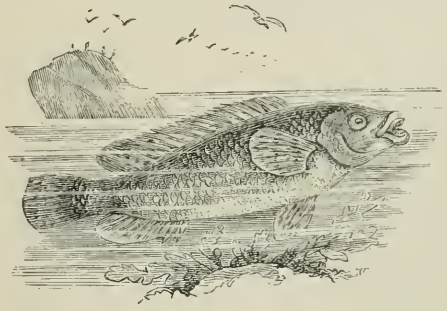
Wrack, a term loosely given to various seaweeds, especially to the Fucaceæ, common on British shores, long valuable as a source of Kelp (q.v.), and utilised as manure. See SEAWEEDS, FUCUS, KELP. For Wrack Grass, see GRASS-WRACK.

Wrangel, FRIEDRICH HEINRICH ERNST, Prussian field-marshal and count (1784–1877), born in Stettin, joined a dragoon regiment, took a distinguished part in the campaigns of 1807, 1813, and 1814, and rose steadily till in 1848 he was general and commander of the Prussian and Federal troops in Sleswick-Holstein. In that year he marched into Berlin and crushed the insurrectionary movement there; in 1856 he became a field-marshal; in 1864 he had supreme command over Prussian and Austrian troops in the Danish war; and, ennobled in 1866, was still able to be present, though without command, with the Prussian army during the Austro-Prussian war.

Wrangel Land, an island in the Arctic Ocean, lying north of the eastern extremity of the Asiatic coast, and intersected by the meridian of 180° E. long. It was seen by the Englishman Kellett in 1849, again discovered by the American Long in 1867, and named after the Russian explorer Wrangel (1796–1870), who sought in vain to reach it in 1821–23. It was first explored by the American expedition under Hooper and Berry in 1881. There seem to be other islands beyond it.

Wrangler, the name given in the university of Cambridge to those who have attained the first class in the public mathematical honour examinations, the student who heads the list in order of merit being called the Senior Wrangler. The word 'wrangler' is derived from the public disputations in which candidates for degrees were in former times required to exhibit their powers. The examination is confined to mathematics, pure and mixed; it is conducted by two moderators and two examiners, with an additional examiner. Down to the year 1882 the undergraduates who satisfied the examiners were arranged in order of merit in three classes—*wranglers*, *senior optimes*, and *junior optimes*. Between 1882 and 1885 inclusive those who attained the rank of wranglers in the examination held in June of each year were admissible to a higher and more special examination held in January of the following year, after which they were arranged in three divisions, according to their respective merits, but the names under each division were placed in alphabetical order. From 1886 to 1892 those who proceeded to the higher examination were placed in three classes, each consisting of three divisions, the alphabetical arrangement holding good as before. From 1893 there are two examinations of four days each, with an interval of eleven days between; those only who have acquitted themselves during the first four days so as to deserve honours are admitted to the examination of the second four days, after which they are arranged strictly according to merit, under the old divisions of wranglers, senior optimes, and junior optimes. The last man of the junior optimes is often called 'Wooden Spoon.' See CAMBRIDGE, UNIVERSITY OF.

Wrasse (*Labrus*), a genus of bony fishes representative of the large family Labridæ, and including many species on European and north African coasts. The body is covered with cycloid scales; the form tends to be oblong; there is a single dorsal fin with a long spinous and shorter soft portion;



Ballan Wrasse (*Labrus maculatus*).

the teeth on the fused lower pharyngeal bones are adapted to crush the shells of molluscs and crustaceans; the teeth on the jaws are conical and

disposed in a single series. The colours are frequently brilliant. The flesh is not much esteemed. The Ballan Wrasse (*Labrus maculatus*) is common and widely distributed, often occurring among the seaweed in deep pools on rocky coasts. It measures 18 inches or more in length; is brightly coloured, often with a red back, an orange belly, orange-red paired fins, and bluish-green unpaired fins; feeds on crustaceans and worms; spawns in spring and summer. The Cook Wrasse (*Labrus mixtus*), also known as Red, Striped, and Spotted Wrasse, is not unfrequent on the southern coasts of England. The adult male is dark greenish above, yellow to orange beneath, with stripes of blue; the female is markedly different, being red with black blotches. In length the male measures about 14 inches, the female about a foot. In summer they live near the rocks, feeding on crustaceans; in autumn they seek deeper water. Nearly related to the genus Labrus is the Corkwing (*Crenilabrus melops*); and the allied genera Ctenolabrus, Acantholabrus, Centrolabrus are also represented on British coasts. A common American fish (*Ctenolabrus adspersus*), known by a variety of names, such as burgall, blue-fish, sea-perch, and nipper, belongs to the same set; and also related is the large Tautog (q.v.) or Black-fish (*Tautoga onitis*). Several species of Wrasse are known as Rock-fish. The Parrot-fish (q.v.) or Parrot-wrasse is the genus Scarus.

Wrath, Cape. See Cape Wrath.

Wratza (*Vruca*), a town of Bulgaria, 43 miles NE. of Sofia. Pop. 10,924.

Wraxall, Sir Nathanael William, was born at Bristol 8th April 1751, at eighteen entered the East India Company Civil Service, but returned to England in 1772, and thereafter for nearly seven years travelled over Europe—even to Lapland, employed part of the time, however, in a confidential mission from Queen Caroline Matilda of Denmark to her brother George III. He published his *Cursory Remarks made in a Tour* in 1775, his *Memoirs of the Valois Kings* in 1777, entered parliament in 1780 as a follower of Lord North, but went over to Pitt, and was made a baronet in 1813. His next books were the *History of France from Henry III. to Louis XIV.* (3 vols. 1795), *Memoirs of the Courts of Berlin, Dresden, Warsaw, and Vienna* (2 vols. 1799), and the famous *Historical Memoirs of my own Time, from 1772 to 1784* (2 vols. 1815). For a libel in the last on Count Woronzov, Russian envoy to England, Wraxall was fined £500 and sentenced to six months imprisonment, half of which he endured. Violent attacks on his veracity were also made by the *Edinburgh*, the *Quarterly*, and the *British Critic*, but Wraxall printed *Answers*, on the whole, with success. He died at Dover, on the way to Naples, November 7, 1831. His *Memoirs*, continued from 1784 to 1790, was published in 1836 (3 vols.). There is an excellent edition of the whole work by Mr H. B. Wheatley (5 vols. 1884).

Wray, John. See Ray.

Wrecks are ships or goods cast on shore by the sea, and are usually distinguished from Derelict (q.v.) property or Flotsam (q.v.). But the Merchant Shipping Act of 1854 and subsequent amendments includes jetsam, flotsam, ligan, and derelict. Shipwrecks may fall under the category of stranding or foundering; and may be caused by storms, fire, collision, leaks (due to straining of timbers, corroding of metal sheathing, &c.), fog, shoals or rocks not marked in charts, imperfect steering-gear, and bad or careless seamanship—ignorance of the position, miscalculation, negligence as to showing ship-lights, colour-blindness, inattention to soundings, disregard of currents, the omission to make due allowance for correction of the compass, and a long list of other possibilities of error. Means of avoiding shipwreck are lighthouses, beacons, storm-signals; and lifeboats and life-preserving apparatus of all kinds diminish the fatalities.

In the time of Henry III., much as in Roman law, wrecks were the property of the crown unless the owner appeared within a year and a day to make good his claim; but a ship was not accounted a wreck legally if any living thing escaped, though even then the ship was made over to the crown after a year and a day if the owner did not compear. Now all action in regard to wrecks in Britain is under the Board of Trade, who appoint receivers of wreck—customs officers, justices of peace, &c. being held bound to act when receivers are not at hand. The receiver takes evidence as to ownership, and reports to the Board of Trade. If the owner does not appear or make good his claim, and if the lord of the manor have no right to unclaimed wreck, then after a year the receiver sells the wreck, and, deducting expenses, pays the proceeds into the exchequer. If the goods or ship are rescued by private persons, Salvage (q.v.) may be demanded. In Scotland a law of 1429 enacted that wrecked ships and their goods should escheat to the king if they were of countries where wrecks belonged to the king; if not, 'broken ships' should have the same favour in Scotland as Scottish vessels received in the countries to which the wrecks belonged.

Stealing wreck is a crime, and so is removing lights, altering them, or showing false lights so as to cause wrecks. *Wrecking*, or showing false lights, used to be a common practice in some parts of the United Kingdom—the population of the Cornish coast being specially notorious for their heartlessness in this respect; and a wreck occurring by the 'act of God' was regarded as a divine bounty to the natives of the district where it was driven ashore. The lives of the unfortunate survivors were by no means safe in the hands of wreckers who feared their booty might be taken from their grasp.

In spite of the disappearance of such barbarous usages, and the establishment of the lighthouses, lifeboats, and all manner of life-preserving apparatus on the most exposed parts of the coasts of civilised countries, the annual loss of shipping and of life by shipwreck is appalling. Mr Mulhall estimates the average tonnage of British shipping lost at 260,000 tons, as compared with 128,000 tons of United States shipping, 46,000 of German, 29,000 French, and 29,000 Italian.

In the year 1890–91 there were reported 6222 casualties at sea to vessels of all sorts belonging to the United Kingdom—3404 to sailing-vessels and 2818 to steamers; the total losses were 546, their tonnage being 208,645 tons; and of them 266 were lost through stranding, 97 through collision, and 89 through foundering. The total lives lost through sea casualties, or vessels wholly or partially lost, were 1491 crew and 590 passengers; of this last number 555 were lost in one vessel, the *Utopia*, sunk at Gibraltar. Of vessels belonging to British possessions abroad the casualties were 903, 293 (of 43,633 tons) being total losses, and the lives lost were 289, 242 seamen and 47 passengers. Of foreign vessels 600 sustained casualties on the shores of the United Kingdom or of British possessions, 118 being total losses, while 73 seamen perished. The number of casualties to ships of all sorts, British and foreign, on the coasts of the United Kingdom were 4198; total losses, 427; lives lost, 523. On the coast of the United Kingdom 2922 lives were saved from shipwreck during the year; 1698 on the coasts of British possessions abroad; 1947 from British vessels on the coasts of foreign countries;

and 1238 from British vessels at sea (see LIFE-BOAT). In 1886–87 there were no less than 1582 vessels totally wrecked on British coasts; in 1879–80 only 355 were reported. The number of lives lost on British coasts was 1333 in the year 1867, and only 396 in 1885–86.

Formerly a wrecked ship that went to the bottom remained there until she was entombed in the shifting mud or sand, or else had undergone a process of gradual dissolution, hastened by the ebb and flow of tides and currents. Wreck-raising was then a science practically undreamt of. Sometimes crude operations were carried on at sunken wrecks (see DIVING, Vol. IV. p. 22); but the object aimed at was the recovery of treasure, and not the raising to the surface of the vessel containing it. The development of mechanical science and steam-power has placed in the hands of modern wreck-raisers machinery that has enabled them to lift many a fine ship from her oozy bed, and restore her to her proper place among the floating argosies of commerce. Most of the vessels that are raised have been the victims of collisions; and these are most frequent in the crowded waters of British harbours and their approaches. The chief economic purpose served by wreck-raising is the keeping clear the fairways leading to the large seaports. Many harbour boards have their own wreck-removing plant; when harbour commissioners do not possess the necessary plant, they advertise for tenders. Years ago the usual practice was to blow the sunken ships to pieces; but when the disaster has occurred in shallow water this is now regarded as wasteful. Between 1880 and 1892 the Thames Conservancy Board raised 399 vessels (277 of which were barges) from the river-bed. The wreck-raising plant employed included a screw-tug, three 150-ton lighters, fitted with steam-winches and steam-pumps; two 150-ton and two 300-ton lighters without steam-power; and two 400-ton lighters. A complete diving equipment is also provided, and an abundant stock of wire and other rope. When a collision takes place and a vessel sinks in the fairway of the river a wreck-boat is moored *in situ*, and the diver makes his examination. All the loose gear is removed, and a number of wire-cables are made fast. The cables are calculated to stand a tension of 150 tons, and they very seldom break. As many as twelve or fifteen cables are sometimes passed under the ship (if large), and made fast to the lighters at dead low-water. The lighters themselves are submerged as far as possible and then pumped dry; and as the tide rises the wrecked vessel leaves her bed in the mud and sand and slowly rises to the surface. Then powerful centrifugal pumps are set at work, and the wreck pumped sufficiently dry to enable her being floated away for repairs. Or 'camels'—as the lifting lighters are generally called—are attached to the cables passed under the vessel at low-water; the ship is raised from her resting-place as the tide rises; and, as the lighters float on the surface, the vessel to which they are attached is just raised the tide's height and no more. Tugs are then employed to tow the lighters and their sunken prize towards the spot selected for beaching. With the appliances possessed by the Conservancy Board ships can be raised whose weight under water does not exceed 1800 tons.

Successful examples of wreck-raising are the *Eurydice*, H.M.S. *Sultan* (sunk in Maltese waters), and the Anchor liner *Utopia* (see below) at Gibraltar. But, with all our modern scientific and mechanical knowledge, wreck-raising can only be carried on in comparatively shallow water. Diving operations can, of course, be carried on at a greater depth. Thus in the year 1885 the screw-steamer *Alfonso XII.* went down off Las Palmas in 165 feet of water, with £70,000 of specie on board, all of which was removed in safety from the bullion-room of the sunken vessel, and raised to the surface by a London firm.

Among wrecks notable for the loss of life, the sufferings of survivors, for historical and literary associations, or for the heroism of captain and crew, are the following:

Many ships of the Armada on British and Irish coasts	1588
Albion (Falconer's 'Shipwreck'), on Campeachy coast	1699
Sir C. Shovel's fleet, Scilly; 2000 lives lost	1707
Wager (Commodore Byron's ship), South Seas	1741
Grosvenor, Indiaman, South Africa	1782
Royal George, under repair at Portsmouth; 900 lives lost	1782
Pandora, frigate; 100 lives	1791
Queen Charlotte, of 110 guns, burned off Leghorn; 700 lives	1800
Abergavenny, Indiaman, on Portland Bill; 300 lives	1805
Aurora, transport, on Goodwin Sands; 300 lives	1805
Minotaur, of 74 guns, North Sea; 360 lives	1810
St George, 98 guns, Defence, 74, Jutland; 1400 lives	1811
British Queen, Goodwin Sands	1814
Medusa, French ship, Senegambia	1816
Queen Charlotte, Madras	1818
Kent, Indiaman, burned during storm, Bay Biscay; all saved	1825
Forfarshire (Grace Darling's wreck)	1838
President, lost between New York and Liverpool	1841
Reliance, Indiaman, near Boulogne; 116 lives	1842
Ocean Monarch, burned off Orme's Head; 178 lives	1848
Royal Adelaide, off Margate; 400 lives	1849
Edmund, emigrant ship, west of Ireland; 200 lives	1850
Birkenhead, troopship, South Africa; 454 lives	1852
Northern Belle, American ship, near Broadstairs	1857
Pomona, American ship, Irish coast	1859
Royal Charter, off Anglesey; 446 lives, and £750,000	1859
Lima, American ship, off French coast; 363 lives	1860
London, in Bay of Biscay; 220 lives	1865
H.M.S. Captain, off Finisterre; 472 lives	1870
Northfleet, off Dungeness; 300 lives	1873
Atlantic, off Nova Scotian coast; 560 lives	1873
Strathmore, South Indian Ocean; 45 lives	1875
H.M.S. Vanguard, rammed by consort; all saved	1875
Schiller, German packet, off Scilly Isles; 331 lives	1875
Deutschland, German steamer, off the Thames; 70 lives	1875
H.M.S. Eurydice, training-ship, off Ventnor; 300 lives	1878
Princess Alice, sunk by collision in Thames; 650 lives	1878
Grosser Kurfürst, German warship, collision; 300 lives	1878
Borussia, German ship	1879
Victoria, on Thames in Canada, upset; 700 lives	1881
Daphne, capsized at launch in Clyde; 124 lives	1883
City of Columbus, U.S. ship, off Massachusetts; 97 lives	1884
Utopia, Italian emigrants, collision, Gibraltar; 574 lives	1891
Bokhara, P. and O. liner, off Pescadores Islands; 125 lives	1892
Roumania, Anchor liner, on Portuguese coast; 113 lives	1892
H.M.S. Victoria, off coast of Syria; 359 lives	1893
Elbe, North German Lloyd liner, collision, North Sea; 335 lives	1895
Reina Regente, Spanish warship, off coast of Morocco; 420 lives	1895
Drummond Castle, Cape liner, near Ushant; 250 lives	1896
Stella, on the Casquets, 65 lives	1899

Wrede, KARL PHILIPP, Bavarian field-marshal and Prince (1767–1838), was born in Heidelberg, shared in the campaigns of 1799 and 1800, fighting at Hohenlinden, invaded Tyrol and took part in the battle of Wagram with the French, and was by Napoleon made a count of the empire. He led the Bavarian troops under Napoleon to Russia in 1812; then, changing sides with his country, commanded a united Bavarian and Austrian army against the French, by whom he was defeated at Hanau. He was, however, victorious in several battles on the sacred soil of France in 1814, and was made field-marshal and prince, with the gift of large estates. He represented Bavarian interests at the Vienna Congress in 1814.

Wrekin. See SHROPSHIRE.

Wren, a genus (Troglodytes) and family (Troglodytidæ) of birds, having a slender, slightly curved, and pointed bill; the wings very short and rounded; the tail short, and carried erect; the legs slender, and rather long. Their plumage is generally dull. They are abundant in the neotropical region, less common in the nearctic, palæarctic, and parts of the oriental regions. They live on or near the ground, seeking for insects and worms amongst low bushes, and in other similar situations. The Common or European Wren (*T. parvulus, europæus,* or

vulgaris) is found in all parts of Europe, and in Morocco and Algeria, and in Asia Minor and northern Persia. In central Asia it is represented by *T. pallidus*. In Iceland and the Faroes it is represented by *T. borealis*, and in the south-west of Norway a species has been found, known as *T. bergensis*. The common wren is more abundant in the northern than in the central and southern parts of Europe. It is a very small bird,

Wren and Nest (*Troglodytes parvulus*).

only about 3½ inches long, reddish brown above, with narrow transverse bars of dark brown, yellowish white below, the greater wing-coverts with three or four small bead-like spots of white. From its peculiarity of form, and its active, lively habits, it is one of the most familiarly known of British birds. It frequents gardens, hedges, and thickets. Its flight is not long sustained; it merely flits from bush to bush, or from one stone to another, with very rapid motion of the wings. It sometimes ascends trees, nearly in the manner of creepers. The male has a loud sweet song. The nest, which is comparatively large, is oval, domed above, with a small opening in the side, and is composed of leaves, hay or moss, sometimes lined with feathers, and generally of materials such that it resembles in colour the objects beside it, and is not easily discovered. It is often placed under the thatch of a building, under the turf of a turf-topped wall, against the side of a moss-covered tree, or under an impending bank, always so as to be sheltered from rain. The eggs are usually from six to eight in number, and the male is assiduous in his attentions to the female in supplying her with food during incubation, and afterwards assists her in the care of the young. Two broods are produced in the season. Imperfect nests, known as 'cocks' nests,' are often found near an occupied nest. In severe winter weather a number of wrens often take shelter together in an old nest, or in a hole of a wall; sometimes they roost in byres, to enjoy the warmth proceeding from the cattle. When driven from bushes, the wren is easily run down; and the hunting of the wren (the 'king of all birds') on St Stephen's or Christmas Day is an old custom in the south of Ireland. A similar custom obtained on other days in other localities. Its origin is unknown. In general, however, the wren is almost as much a popular favourite in Britain as the redbreast. The name *Kitty* or *Jenny Wren* is popularly given to it in many parts of the country. The North American species of wren are numerous; but many of them are ranked under different genera. The House Wren (*T. domesticus* or *ædon*) is larger than the European wren, being about 5 inches long. It is reddish brown above, barred with dusky, and pale fulvous white below, with a light brownish tinge across the breast. It is abundant in the eastern parts of the United States. It is less shy than the European wren, and often builds its nest near houses, and in boxes prepared for it. The nests are made to fill the boxes; and to effect this a large mass of heterogeneous materials is sometimes collected. The song of the house wren is very sweet. The male is a very bold, pugnacious bird, readily attacking birds far larger than itself, as the blue-bird and swallows, and taking possession of the boxes which they have appropriated for their nests. It even attacks cats when they approach its nest. The Winter Wren (*T. hyemalis*) is so similar to the European wren that it is not easy to state a specific difference. It is common throughout North America, from Labrador to Louisiana, and partially migratory. Several other species, common in North America, all agree very nearly in their habits with the common wren. See also GOLDEN-CRESTED WREN.

Wren, SIR CHRISTOPHER, architect, was born at East Knoyle in Wiltshire, on the 20th of October 1632. His father, Dr C. Wren, was Dean of Windsor, and his uncle, Dr M. Wren, was Bishop successively of Hereford, Norwich, and Ely. Young Wren was educated at Westminster School, under the celebrated Dr Busby, and while yet only in his fourteenth year was entered a gentleman-commoner of Wadham College, Oxford. Here he distinguished himself in mathematics, attracted notice by his inventions of certain mathematical instruments, and his enthusiasm in experimental philosophy. In 1650 he took his degree of B.A., and in 1653 that of M.A., having been previously made fellow of All Souls. In 1654 he is spoken of by Evelyn as 'that rare and early prodigy of universal science;' and acquaintance ripened into a firm friendship between Wren and Evelyn.

In 1655 Wren assisted in perfecting the barometer. In 1657 he left Oxford for London, where he became Gresham professor of Astronomy, but in May 1661 returned to Oxford as Savilian professor of Astronomy. The same year he received the degree of D.C.L., and that of LL.D. at Cambridge. Before leaving London Wren had, in conjunction with Lord Brouncker, the Hon. Robert Boyle, Dr Wilkins, and others, who used to meet together at Gresham College, laid the foundation of the future Royal Society. One of the first proceedings of the Society was to get the king to lay his commands upon Wren to perfect a design he had in hand of a globe of the moon, and to 'proceed in drawing the shapes of little animals as they appear in the microscope.' The lunar globe was finished, much to the satisfaction of his Majesty, who placed it in his cabinet of rarities. He also summoned Wren from Oxford to assist Sir John Denham with his advice on architectural subjects; the poet Denham having been appointed surveyor-general of his Majesty's buildings, but possessing little or no knowledge of the subject.

The study of architecture was one to which Wren had given great attention, notwithstanding his devotion to mathematics, astronomy, chemistry, and even anatomy. In 1663 he was engaged by the Dean and Chapter of St Paul's to make a survey of the cathedral, with a view to certain projected repairs in that vast fabric. He accordingly drew up a very careful and elaborate report, but before any steps were taken St Paul's was irreparably injured by the memorable fire of 1666, and Wren was destined to be the architect of the new cathedral instead of the restorer of the old. The first work actually built from a design by Wren was the chapel at Pembroke College, Cambridge, in 1663. But in the same year he designed the Sheldonian Theatre at Oxford (1664–69). In 1664 Wren also designed some valuable additions to the buildings at Trinity College,

Cambridge, particularly the beautiful western quadrangle known as Nevile's Court. To this he added in 1666 the Library of Trinity College, said by Gwilt to be 'one of his finest productions, and one with which he himself was well satisfied.'

In 1665 Wren visited Paris, where he made the acquaintance of Bernini, architect of the colonnade of St Peter's, Rome, and of other distinguished men. In the following year he returned, to find the Royal Society earnestly engaged in searching out the causes of the great plague, so soon to be succeeded by the great fire which laid London in ashes. This disaster at once opened a wide field for the exertion of Wren's genius. He formed a plan and drew designs for the entire rebuilding of the metropolis, embracing wide streets, magnificent quays along the banks of the river, and other well-considered improvements. In rebuilding London, however, few of Wren's recommendations were adopted. He was certainly chosen to be the architect of new St Paul's, one of the finest non-Gothic cathedrals in the world; besides which he designed more than fifty other churches in place of those destroyed by the fire. The great church of St Paul, built on the model of St Peter's at Rome, was begun in 1675 and completed in 1710, when the last stone was laid upon the lantern by the architect's son, Christopher.

Besides the numerous churches mentioned, Wren built or designed the Royal Exchange (1667); Custom-house (1668); Temple Bar (q.v., 1670); the Monument (1671–77); the College of Physicians (1674–98); the Royal Observatory, Greenwich (1675); the Gateway Tower, Christ Church, Oxford (1681–82); Chelsea Hospital (1682–90); Ashmolean Museum, Oxford (1683); Hampton Court (q.v., 1690); Morden College, Blackheath (1692); Greenwich Hospital (1696); Buckingham House (1703); Marlborough House (1709); the western towers and the north transept, recently altered, of Westminster Abbey (1713); besides the unfinished palace of Winchester (1683). See RENAISSANCE.

In 1672 Wren received the honour of knighthood. In 1674 he married a daughter of Sir John Coghill, by whom he had a son, Christopher (1675–1747, antiquary); and in 1679 he married a daughter of Viscount Fitzwilliam, by whom he had a son and daughter. In 1680 he was elected President of the Royal Society; in 1684 was made comptroller of the works at Windsor Castle, where he built the state apartments, of which the exterior only was Gothicised by Wyatville; and in 1685 was elected Grand-master of the order of Freemasons. He was also elected a member of parliament for Windsor in 1689, and being unseated on petition was immediately re-elected. In 1698 he was appointed surveyor-general of the repairs at Westminster Abbey. Wren died at his house at Hampton Court, sitting in his chair after dinner, on 25th February 1723, aged ninety years, and was buried in St Paul's Cathedral, where the appropriate inscription, 'Si monumentum requiris, circumspice' marks his tomb. During his declining years he was treated with neglect, and even injustice, by the court of England; 'one Benson' was appointed by George I. to supersede him in the office of surveyor-general; and some private individuals carped at his works in a most malevolent spirit. Steele, however, vindicated the fame of his friend in the *Tatler*, in which Wren is introduced in the character of Nestor; and few have since been found hardy enough to call in question the well-merited reputation of Sir C. Wren as architect, mathematician, and scientific observer.

See Milman's *Annals of St Paul's* (1868), Lives by James Elmes (1852), Miss Phillimore (1881), and W. J. Loftie, *Inigo Jones and Wren* (1893).

Wrestling, one of the most ancient forms of athletic exercise, was a favourite pastime of the Greeks when Greece in civilisation, military knowledge, and in the cultivation of arts and sciences stood head and shoulders above all the states of the civilised world. The Olympic Games, the great festival of the Greeks, which were instituted for the exhibition of various trials of strength and skill, included races on foot, and with horses and chariots, contests in leaping, throwing, boxing, and wrestling. In the games described by Homer valuable prizes were offered, but after the seventh Olympiad a single garland of leaves of the wild olive was substituted at Olympia as the only meed of victory. One of the great objects of the old classical wrestlers was to make every attack with elegance and grace under certain laws of a most intricate nature, and the game is described by Plutarch as the hardest working form of athletics. In Devon and Cornwall wrestling on the catch-hold principle still finds favour. In Lancashire they adopt a catch-as-catch-can style; while in Cumberland and Westmorland the ancient back-hold system continues to hold its own. The Scotch have recently adopted a twofold mixture to be hereafter described; and in Ireland collar-and-elbow wrestling is the prevailing fashion. In the United States and Australia, in Germany, France, and Japan ground-wrestling, which is the most objectionable of all known methods, is the most popular. This system has been dignified by the high-sounding title of Græco-Roman wrestling. The Græco-Roman style is practically the same as the French method, and consists of a struggle on the ground until one or other of the competitors is compelled through sheer exhaustion to give in; indeed, such a contest is simply an exhibition of brute strength, and its introduction into England has done more to bring this ancient pastime into contempt than anything that has taken place in the history of the exercise during the 19th century. On commencing, the wrestlers take hold from the head and not lower than the waist, when both roll on the ground, and then the actual struggle begins. Tripping, which is the very essence of the game, is not allowed; therefore weight and strength are the only factors in the contest, which terminates when one of the combatants has been placed on both shoulders.

The Cornwall and Devon system is a perfect drawing-room entertainment in comparison with the foregoing hybrid style. The champions hailing from these two counties wrestle in strong loose linen jackets, and lay hold above the waist or by any portion of the jacket; and in order to be fairly thrown two shoulders and one hip must be on the ground, or two hips and one shoulder, and a man must be thrown flat on his back before any other portion of his body touches the earth ere a decision can be given against him. Kicking is now forbidden, and the men usually wrestle in their stocking feet, which is a great improvement on the olden method when heavy boots shod with iron were used as a means of attack and defence. The Lancashire fashion allows unlimited action. The competitors are permitted to catch hold where they please, legs included, but they must not scratch or throttle or deliberately injure one another. Here again ground-wrestling becomes a great factor in a struggle for supremacy. In fact, Lancashire wrestling so much resembles what is called the Græco-Roman style with other objectionable surroundings that it scarcely deserves to be classed among the English systems. Two shoulders on the ground constitutes a fall with fifteen minutes rest between each bout. The Cumberland and Westmorland method is probably the best-known style at the present moment, and is still popular in such arenas as those at Carlisle, Grasmere, and other wrestling resorts in the northern counties. Unfortunately the annual Cumberland and West-

morland gatherings in London ceased, for no particular reason, in 1888, when the old wrestling society, which had existed from the year 1824, was apparently in a flourishing condition. This was one of the first noticeable signs that the ancient pastime was on the decline, and had begun to give place to the, comparatively speaking, modern games of cricket and football. It will certainly be a subject for regret if the exercise is allowed to sink into oblivion, towards which it is unfortunately drifting. In the Cumberland and Westmorland style, when both men grasp each other round the body with the left arm above and the right underneath the play commences. Neither party is allowed to break his hold until the wrestle is over, and the one who touches the ground first with any part of his body, the feet of course excepted, is deemed the loser. If both fall together it is technically termed a 'dog-fall,' and the men wrestle over again.

In the newly-adopted Scotch style of wrestling a commencement is made by taking hold in the Cumberland and Westmorland fashion with the arms round the body and the hands grasped in the well-known back-hold style. The tussle which ensues frequently lands one of the wrestlers flat on his back, and ends the contest before the struggle on the ground begins. If, however, a fair back-fall, with both shoulders down, does not result, then the bout is continued under Græco-Roman rules. In Ireland the collar-and-elbow system still holds good in a limited degree, and some years ago frequent matches took place in the Phœnix Park, and at the Curragh at Kildare. The Irish style is simplicity itself. The competitors catch hold of the elbow with one hand and the collar with the other, and neither party is allowed to let go his hold till the fall has been gained. It is in some parts called heuching, but cannot be considered a satisfactory mode of deciding a contest; yet it is useful in the case of sudden and unexpected attack, as the hold is easily obtained. The Swiss again compete in a special wrestling-costume consisting of drawers, shirt, and a stout belt. A hold can be taken by the drawers alone, the shirt, or the belt, or by all at one and the same time according to the taste of the wrestler. There is no ground-wrestling, and first man down loses in Switzerland, a much to be commended system. The French and Germans have their own fashion, but they so closely resemble the Græco-Roman and Lancashire style that the difference amounts to nothing. Practically ground-wrestling is the practice in both countries, with two shoulders down to constitute a fall. The great continental event of recent years was the victory at Berlin on 25th July 1891, in the presence of 8000 spectators, of Carl Abs over Tom Cannon, who had previously defeated twenty-seven others.

Wrestling has recently become popular in Japan and India. The Japanese have adopted the Græco-Roman style, and receive handsome rewards at the conclusion of their contests. The Jap wrestlers, who are a most formidable class of men, before entering the arena adorn themselves with a certain kind of war-paint, with a huge belt round the waist and their enormous calves encased in stout leggings. The Indians, on the other hand, wrestle in bathing-costume, and in a match only contest one bout, and one shoulder on the ground is deemed a fall. Such is a summary of the different systems of wrestling now before the public. In order to make the foregoing a little more explicit, let us recapitulate the various styles touched upon, and the definitions of a fall appertaining to each. Græco-Roman, ground-wrestling, two shoulders down to constitute a fall. Cornish and Devon, no ground-wrestling, three points down, sometimes four points down as per arrangement. Lancashire, ground-wrestling, two shoulders down, any hold. Cumberland and Westmorland, no ground-wrestling, any point down. Scotch, ground-wrestling, two points, or shoulders down. Irish, first down to lose. Swiss, first down to lose. French, German, and Japanese, ground-wrestling, two shoulders down. Indian, one fall, one shoulder-blade down to constitute a fall. Ground-wrestling is unquestionably un-English, and as stated above has brought a useful and ancient pastime into disrepute. Promoters of the sport have for years endeavoured to introduce an amalgamated system on the catch-hold principle, not lower than the waist, in which the wrestler who first touches the ground shall be considered the loser, but success has not hitherto crowned their efforts.

See Litt's *Wrestliana* (Whitehaven, 1823); *Wrestling*, by the present writer, Walter Armstrong ('All England' series, 1889); Pollock and Grove, *Fencing, Boxing, and Wrestling* (Badminton Library, 1889); Blackmore's *Clara Vaughan*, for a fine description of a wrestling-match; and Léon Ville, *La Lutte Française* (1892).

Wrexham, a town of Denbighshire, called sometimes the 'metropolis of North Wales,' on an affluent of the Dee, 12 miles SSW. of Chester. Its church, destroyed by fire in 1457, and rebuilt in 1472–1520, was restored in 1866–68 at a cost of £4000, and is a fine Perpendicular structure, whose tower, 135 feet high, contains ten bells of singular sweetness, and is one of the 'Seven Wonders of Wales.' Judge Jeffreys was born close by, at Acton; and Bishop Heber wrote 'From Greenland's Icy Mountains' in the vicarage. Wrexham is situated in the heart of a mining district, and has far-famed breweries, tanneries, &c. It was incorporated in 1857, and with Denbigh (q.v.), &c. returns one member to parliament. Pop. (1851) 6717; (1891) 12,552.

Wright, Joseph, a painter, called commonly 'Wright of Derby,' was born there on 3d September 1734, the third son of 'Equity Wright,' an attorney and town-clerk. He was educated at Derby grammar-school, and at Derby he died on 29th August 1797, having passed his whole life in his native town, with the exception of three and a half years under Hudson in London (1751–54), two years in Italy (1773–75), and two at Bath (1775–77). He married in 1773 Hannah Swift (1749–90), who bore him three sons and three daughters; first exhibited in London in 1765; and was elected an A.R.A. in 1781, an R.A. in 1784—this latter honour he declined. His paintings—of which there was an exhibition at Derby in 1883—are largely portraits or portrait groups, representing not seldom effects of artificial light, as, e.g., in his well-known 'Orrery' (1766) and 'Air-pump' (1768). If inferior to Gainsborough and Reynolds, and to Romney at Romney's best, Wright of Derby stands very high among the English painters of the 18th century, being 'a master of strong effects of light and shade, gifted with fine perception of the powers of local colour, and something of a poet in landscape.' See the fine folio on him by Mr William Bemrose (1886).

Wright, Thomas, antiquary, was born near Ludlow, Shropshire, 21st August 1810, the son of a Quaker who had migrated from Bradford. From Ludlow grammar-school he proceeded to Trinity College, Cambridge, where he took his B.A. in 1834. He had already contributed to *Fraser's* and other magazines, when in 1836 he went to London, and at once commenced the career of a man of letters. In 1837 he was elected a fellow of the Society of Antiquaries, and in 1838 was one of the two founders of the Camden Society, as in 1843 of the British Archæological Association. He also took an active part in the formation of the Percy and Shakespeare

Societies, and for each of these, from time to time, edited volumes. In 1842 he was elected a corresponding member of the French Académie des Inscriptions, and he was also a member of other learned societies on the Continent and in America. He died at Chelsea, 23d December 1877.

From 1836 onwards he published eighty-four works, including, of course, translations and works edited for societies. The following may be mentioned: *Biographia Britannica Literaria* (2 vols. 1842–46); *Essays on the Literature, Popular Superstitions, and History of England in the Middle Ages* (2 vols. 1846); *England under the House of Hanover, Illustrated from the Caricatures of the Day* (2 vols. 1848); *Narratives of Sorcery and Magic* (2 vols. 1851); *History of Ludlow* (1852); *The Celt, the Roman, and the Saxon* (1852); *History of Ireland* (3 vols. 1854); *Wanderings of an Antiquary* (1854); *Dictionary of Obsolete and Provincial English* (2 vols. 1857); *History of France* (3 vols. 1856–62); *Political Poems and Songs, from the Accession of Edward III. to that of Richard III.* (2 vols. 1859–61); *Les Cent Nouvelles Nouvelles* (2 vols. 1858), being a collection of mediæval tales from the only known manuscript of the same, discovered by Wright in the library of the Hunterian Museum, Glasgow; *Essays on Archæological Subjects* (2 vols. 1861); *History of Domestic Manners and Sentiments in England during the Middle Ages* (1861); *A History of Caricature and Grotesque in Literature and Art* (1865); *Womankind in Western Europe* (1869); *Uriconium* (1872; see WROXETER); and *Anglo-Latin Satirical Poets of the Twelfth Century* (2 vols. 1877).

Wrightia. See INDIGO.

Wrist. See HAND; and for Wrist-drop, a form of lead-poisoning, see under LEAD.

Writ, in English law, means a written order addressed to a subject in the king's name. Since the Norman Conquest writs have been freely devised and altered for many different purposes. Some are of an administrative or political nature, as, for example, the writ addressed to a returning-officer, commanding him to hold an election, and return the name of the person elected; writs of mandamus and prohibition, by which inferior courts are kept within the bounds of their jurisdiction; and the famous writ of Habeas Corpus (q.v.), by which a person who has another in custody is commanded to bring up his prisoner and to show by what authority he detains him. An action at law was formerly begun by an 'original writ' issued under the great seal; it is now begun by a writ of summons, requiring the defendant to appear and answer the plaintiff's claim. The judgment of the court is enforced by a writ of execution, as, for example, the writ of Fieri Facias (q.v.), which directs the sheriff to levy the debt by seizing the defendant's goods. See CAPIAS, CERTIORARI, ELEGIT, ERROR, MANDAMUS, NE EXEAT, SUBPŒNA, &c. Formerly the king would issue writs of execution without trial, but this abuse was taken away by the Great Charter of 1215. *De Hæretico Comburendo* was abolished under Charles II. Many of the old forms of writ have been abolished (such as Latitat, which proceeded on the legal fiction that the defendant was in hiding out of Middlesex) or rendered obsolete by modern changes in procedure, such as Scire Facias and Quo Warranto (q.v.). In the United States the several states differ considerably; thus in New York writs of Error and writs Ne Exeat have been abolished. See also SUMMONS and WARRANT.

Writer's Cramp. See CRAMP.

Writers to the Signet, an ancient society of solicitors in Scotland who formerly had the exclusive right to prepare all summonses and other writs pertaining to the supreme court of justice (see SIGNET). Under the 31 and 32 Vict. chap. 101 they have still the exclusive privilege of preparing crown writs, which include all charters, precepts, and writs from the sovereign or prince of Scotland. The office of Keeper of the Signet was in 1817 conjoined with that of Lord Clerk Register. See LIBRARY, p. 607.—*Writer* is also a term vaguely applied in Scotland to a law practitioner or his clerk.

Writing. In the article ALPHABET an account has been given of the various systems of writing, ideographic, syllabic, or alphabetic, and all existing alphabets have been traced to their origin in the Egyptian hieroglyphic picture-writing. In the articles PALÆOGRAPHY and INSCRIPTIONS the standard records, documents, and manuscripts have been catalogued, and the various 'hands' or styles of penmanship have been described, so that it is now only necessary to give an account of the materials used for writing, and of the influence of these materials in modifying or transforming the character of the several scripts.

Copyright 1892 in U.S. by J. B. Lippincott Company.

The chief materials on which writings have come down to us are stone, clay, metal, potsherds, wood, papyrus, leather, parchment, wax-tablets, palm-leaves, and paper. The oldest documents which we possess come from the earliest seats of civilisation, Babylonia and Egypt, and the Babylonian and Egyptian scripts begin with inscriptions on stone. The style of the cuneiform inscriptions is due to their having been written on tablets of soft clay, which have then been dried in the sun or kiln-baked. But this cuneiform writing was itself developed out of an earlier lapidary script, the linear Babylonian, so called because it is formed of lines, not wedges, as shown in the undated lapidary inscriptions from Tel-lo (Telloh), or the inscription of Sargon of Agade, who reigned about 3800 B.C. (see BABYLONIA, Vol. I. p. 633). But when the linear Babylonian had been modified owing to the use of clay, the lapidary inscriptions follow the wedge-shaped forms which arose out of the clay script. The wedge-shaped forms are believed to have been impressed on the soft clay by means of a square-headed implement, a corner of which was dinted into the clay. The great library of Nineveh consisted of clay-tablets containing Assyrian copies of older Babylonian documents, and from Babylon we have on similar tablets the records of the Egibi

Fig. 1.—A Cuneiform Clay-tablet (reduced).

banking firm, consisting of innumerable deeds relating to financial transactions, such as loans, sales, and marriage settlements. The contract tablets go back to the 24th century B.C., and come down to the time of Domitian.

The oldest inscriptions of Egypt, which may be earlier by a thousand years than any from Babylonia, are also engraved on stone; but papyrus was also used at an extremely remote period. Hence two styles arose, the hieratic for papyrus and the hieroglyphic for inscriptions. The oldest book in existence is the *Papyrus Prisse*, now at Paris. It was found in 1847, in a Theban tomb of the 11th dynasty (2500–3000 B.C.), and purports to be a copy of a much earlier treatise, composed in the time of the 5th dynasty. It is written in a bold hieratic hand, bearing little resemblance to the hieroglyphic picture-writing from which it was derived. Such remains of the literature of ancient Egypt as we possess have chiefly come to us on papyrus rolls found in Egyptian tombs. From

Egypt the use of papyrus spread to Europe. The oldest Greek records are inscriptions on stone or metal, but we possess Greek papyri found in Egypt which date from the 2d century B.C. At Herculaneum a library consisting of some 2000 carbonised

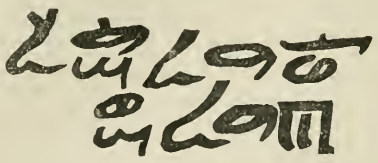

Fig. 2.—Specimen of the Writing of the *Papyrus Prisse*.

rolls of papyrus has been discovered. It consists mainly of Greek treatises on the Epicurean philosophy, but comprises a few Latin works, among them a poem on the battle of Actium. In the 5th century the rescripts of the Imperial Chancery at Constantinople were written on papyrus; we have papyrus deeds from Ravenna dating from the 5th to the 10th century; and in the 7th century papyrus was used for the charters of the Merovingian kings in Gaul. In the 8th century, owing to the Moslem conquest of Egypt, papyrus became more difficult to procure, but it continued to be used in the Papal Chancery till the middle of the 11th century. Concurrently with the use of papyrus for deeds and rescripts, parchment, a more costly material, was largely used for books. As to the date of its invention, Pliny records the legend that Ptolemy V. (205–185 B.C.) prohibited the exportation of papyrus from Egypt, and that in consequence the books in the great library at Pergamus were written on skins specially prepared, called from the place of their origin *pergamena*, from which the word parchment is derived. Leather had previously been used, and is still employed by the Jews for the sacred rolls of the law. Parchment is leather so prepared that both sides can be used to write on. From the 4th to the 16th centuries parchment, made from the skins of sheep, goats, and calves, was the usual material for books. Vellum is merely a finer kind of parchment made from the skins of younger animals.

Paper (q.v.), made of vegetable fibre or of rags, was probably invented by the Chinese, and introduced into Europe by the Arabs in the 9th century; in the 13th century it was used in France for deeds, and in the 15th century for books. But for the invention of paper, the printing-press would have been an invention of comparatively little importance, papyrus being too frail and parchment too costly for the multiplication of printed books.

For ordinary purposes, such as letters, accounts, and the first drafts of books, the Greeks and Romans made use of wooden slabs covered with a thin coating of wax, on which the writing was scratched with a hard point of metal, wood, or ivory, which was called the *graphium* or *stilus*. The other end of the stilus was flattened into a palette, which served to efface the writing or to smooth the wax. These tablets were called *deltoi* by the Greeks, and *tabulæ* by the Romans. They were connected by rings, serving as hinges, and two or more slabs thus connected were called a caudex or codex. A codex of two leaves or slabs was called a diptych, and one of three leaves a triptych. The peculiarities of the Roman cursive hand are largely due to the employment of these wax-tablets. They were used in France till the 13th century, and then superseded by paper.

Papyrus MSS. are, as a rule, written only on one side, and are usually found in the form of cylindrical rolls. Our word 'volume' is derived from the Latin name *volumen*, which was given to these rolls. When parchment came into use, we have also the word *rotulus*, whence the name of the Master of the Rolls, who was *custos rotulorum*, the keeper of the rolls or legal documents of the Chancery. The Greeks called these rolls *biblia*, whence the name of the Bible, and the word *bibliotheca* for a library. When the work was in several rolls the rolls were called *tomoi* (Gr., 'slices,' 'sections'), whence the word 'tome.' The Latin word *liber*, 'a book,' whence our 'library,' points to the use of the bark of trees as the material for writing, while 'book,' from the A.S. *bóc*, 'a beech tree,' points to the fact that the runes were cut on slabs of beech-wood. The book form

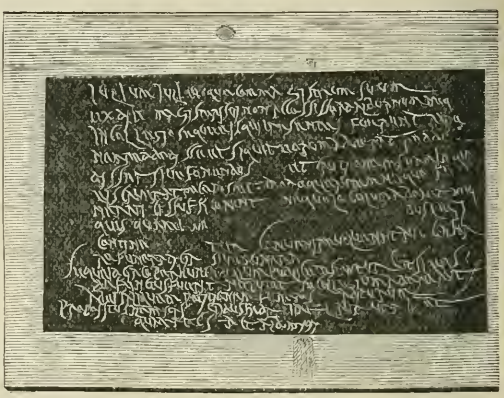

Fig. 3.—Latin Wax-tablet, 2d century (reduced).

was adopted for literary works written on parchment, and the name codex, originally given to the hinged sets of wax-tablets, was transferred to such MSS., distinguishing them from the *volumina* and *rotuli*. Codices written on papyrus are rare, the material being so fragile that it was liable to tear in turning over the leaves. There is, however, at Paris a papyrus codex of the 6th century, containing the sermons of St Avitus, Bishop of Vienne, and another of nearly the same date, containing some of the works of St Augustine. At Milan there is a papyrus codex of the 7th or 8th century, containing a Latin translation of Josephus by Rufinus. Before the 15th century MSS. are not paged, but only foliated—i.e. only the leaves or quires, and not the pages, are numbered. Till the 11th century the lines for the writing are scratched with a dry-point, in the 13th they are ruled with a plummet or lead point, or with red ink.

In Egypt great numbers of graffiti or inscribed

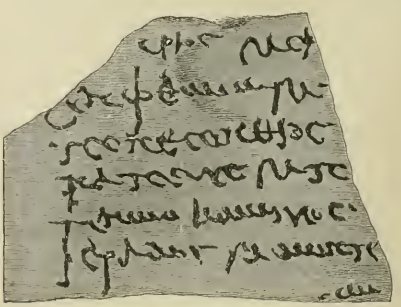

Fig. 4.—Fragment of an Egyptian Ostracon.

potsherds, called *ostraca* (lit. oyster shells), have been found. Sometimes the writing is scratched with a sharp point, but is more commonly written in ink with a reed. Some of these *ostraca* are

letters or orders to officials, but most usually they are receipts for taxes. The tax-collectors must have gone round with donkeys laden with potsherds in order to give these receipts. We have also Graffiti (q.v.) rudely scribbled on the plaster of Pompeian and Roman walls, which are valuable as disclosing the popular spelling and the cursive hand of the period.

Documents intended for preservation, if not inscribed on stone, were usually engraved on metal. The questions addressed to oracles were scratched on leaden plates, of which great numbers have been found, and leaden plates, containing the name of the deceased, were used as scrolls for *loculi* in tombs. Treaties between Greek states were frequently engraved on bronze plates and affixed to the walls of temples.

The oldest specimens of Indian writing are the rock inscriptions of Asoka (q.v.), which date from the 3d century B.C. These are succeeded by numerous inscriptions from Buddhist caves. The grants of land to temples were commonly engraved on copper plates. But the characteristic Indian material was the palm-leaf, the use of which has profoundly modified the scripts of Southern India, Orissa, Ceylon, and Burma. The palm-leaves were strung together something in the manner of a rosary, by a cord passing through holes bored in the leaves. The Devanagari, or Sanskrit Book-hand (fig. 5), was written on palm-leaves with a reed and ink, but exhibits characteristic forms due to the earlier employment of a dry point, the connecting line from which the letters depend being in this case necessarily absent.

ईश्वर इत्थं जगदद्यत यत् स्वमद्वितीयं
तनयं प्राददात यतो यः कश्चित् तस्मिन्
विश्वसिष्यति सोऽविनाश्यः सन् अनन्तायुः
प्राप्स्यति।

Fig. 5.—St John, iii. 16, in Sanskrit (the Devanagari character), as printed by the British and Foreign Bible Society.

The reed, called *calamus*, *fistula*, *arundo*, or *canna*, and cut like our quill-pens, was used for writing with ink on papyrus or parchment. It is still employed in the East, and in the West continued to be used till the 12th century. Isidore of Seville, who wrote in the 7th century, is the first to mention the quill—*penna*, 'a feather,' whence our word 'pen.' In the 13th century the quill had replaced the reed, and the result of the change is seen in the adoption of finer up-strokes. The general use of steel pens has had considerable effect on modern scripts, but metal pens, or calami made of bronze, were not unknown to the ancients. The last innovation is the stylographic pen, the use of which is modifying modern hands.

Ink was usually black. The oldest inks were thick and glutinous, necessitating the use of a brush, as in the earlier hieratic writing, and in Chinese or square Pali. A thinner ink, suited for the reed, was made from gall-nuts and sulphate of iron (see INK). Red and blue ink were used for titles or initials. From the 6th to the 11th century coloured inks are rare, but in the 12th they become more common. For an account of gold and silver writing on purple parchment, see ILLUMINATION.

Among Aryan nations the writing is horizontal, and the normal direction from left to right. The Semitic scripts, on the other hand, are written from right to left, this being the direction of the early hieratic, from which the Phœnician alphabet was derived. Hebrew, Syriac, and Arabic, and the scripts derived from the Arabic, such as Turkish, Afghan, and Hindustani, retain this direction. The oldest of the Greek inscriptions follow the Phœnician direction, but at an early period they are occasionally written in a snake-like form, following the margin of the stone. In the 6th century, or even earlier, we find them written *boustrophedon* or 'plough-wise,' the lines running alternately from right to left, and from left to right, just as oxen, when ploughing, draw the alternate furrows in opposite directions. Finally all the lines were written from left to right. The same happened in Italy. The older inscriptions are retrograde, a direction long retained by the Etruscans, while from Cumæ we have boustrophedon inscriptions, until finally the direction from left to right was adopted. The same was the case with the runic writing, which was obtained from the Greeks before the direction of the writing had been changed. The earliest runic inscriptions are retrograde, then they become serpentine or boustrophedon, and finally they are written from left to right. The Himyaritic inscriptions from Arabia Felix are retrograde, boustrophedon, or from left to right, a direction which was adopted when the Himyaritic writing penetrated to India. Hence the Devanagari, the Pali, and all the derived Indian scripts are written from left to right. Chinese is written in vertical columns, beginning with a column on the right-hand side of the paper. The Manchu and Mongolian scripts are also written in vertical columns, but, unlike the Chinese, they begin on the left-hand side of the paper. The Mongolian, from which the Manchu was derived, was obtained from the Syriac script of the Nestorian missionaries, who at first wrote from right to left, and then for convenience wrote vertically, the paper being turned round through 90° to enable it to be read. Finally it was both written and read vertically.

The character and general appearance of scripts has been greatly influenced by the nature of the materials employed, whether stone, clay, metal, wood, papyrus, wax, palm-leaves, parchment, or paper, and also by the implement, whether chisel, brush, reed, stile, or quill, as well as by the quality of the ink. Scripts of wholly different origin, if written with the same materials, acquire a general external resemblance. If a brush, with thick glutinous ink be employed, the writing tends to become upright, thick, and bold, as in Chinese, Siamese, Square Pali, and the hieratic of the old Egyptian empire. If a reed be used the writing often slopes to the left, the up-strokes and down-strokes being of the same thickness, as with a stylographic pen. On the other hand, with a quill or a steel pen the writing slopes to the right, and the up-strokes are fine. Thus it is manifest that our printed capitals, such as W, M, N, or V, are imitations of quill-written letters, the down-strokes being thicker than the up-strokes. With a lapidary script the strokes are all of the same thickness, the letters are square, angular, upright, and regularly formed, eschewing oval loops or sweeping tails. Thus lapidary Greek and lapidary Himyaritic have a superficial resemblance, though their pedigrees are different. A xylographic script, such as the runic writing, is rectilinear and regular, like a lapidary script, but triangles are preferred to squares, complicated forms disappear, curves and horizontal lines are avoided, diagonals running obliquely across the grain of the wood being preferred. Hence in the runic writing H becomes N, the bars of F slope upwards, and those of E

slope downwards (see RUNES). A palm-leaf script, if scratched with a point, and not written with a reed, prefers arcs of circles and vertical lines, lending itself readily to intricate convolutions, but like a xylographic script it rigorously eschews horizontal lines, which would cause the leaf to split. Palm-leaf scripts, such as those of Orissa, Ceylon, and Burma, have a superficial resemblance, though their pedigrees may differ. On metal, if the writing be punched, it partakes of lapidary forms; if written with a point it becomes scratchy, and we get intersecting lines, the angles are not joined with precision, and circles become irregular ovals. On clay the loops are opened, all the forms are rectilinear, and the strokes become parallel and detached. Books written on parchment, a costly material, exhibit an elaborate caligraphic style, the letters being upright, separately formed, regular in size, with symmetrical curves, elliptical rather than circular curves being preferred. The up-strokes are

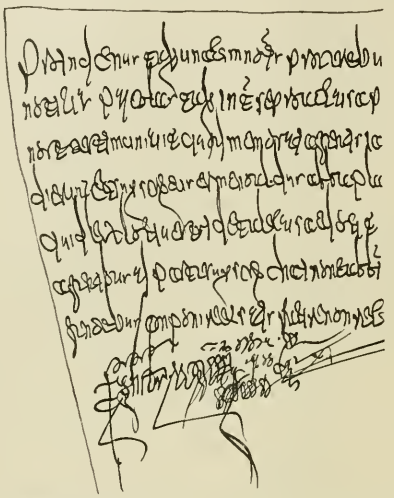

Fig. 6.—Merovingian Script, 7th century. Portion of a Charter of Clovis III. (reduced).

fine, and the down-strokes of uniform thickness. But if a rough and cheap material, such as papyrus or paper, be employed, the writing tends to become careless and cursive, easily degenerating into an almost illegible scrawl, as in the Merovingian charters, exhibiting blotted loops and elongated tails, the letters being joined by ligatures which have a tendency to modify the forms of the letters. Thus A is a lapidary form, a is a parchment form, while *a* is a paper form. The same characteristics are exhibited by M, m, and *m*; G, g, and *g*; B, b, and *b*; and by most of the other *f* letters.

Assimilation also produces superficial resemblances, especially between contiguous letters, such as E and F, M and N, m and n, p and q. The effects of dissimilation have also to be reckoned with. Thus when r took the form *r* the resemblance to the written *z* became a source of confusion, and the latter letter acquired a tail and became *ȝ*. So the oldest forms of the letters b, d, and *f* r, which consisted of a triangle with a tail, were almost undistinguishable, and, the triangle having become a loop, from a common form resembling P three differentiated forms arose, the letter B acquiring a lower loop, the letter D losing its tail, and the letter R acquiring a second tail, so that B, D, and R are now perfectly distinct.

The history of writing exhibits a constant process of decay and regeneration. Careful book-hands degenerate into illegible cursive scripts, and then new book-hands are gradually developed, which again degenerate. There is a constant struggle between two principles—the principle of least effort, which tends to render writing illegible, and the need of being legible, which tends to regeneration. Thus the beautiful uncial book-hands gave place to the illegible Greek and Roman cursives, and out of these cursives the new minuscules were evolved, which again degenerated into almost illegible cursives. Fashions in writing vary with time and place. Some distinctive national hands are described at PALÆOGRAPHY.

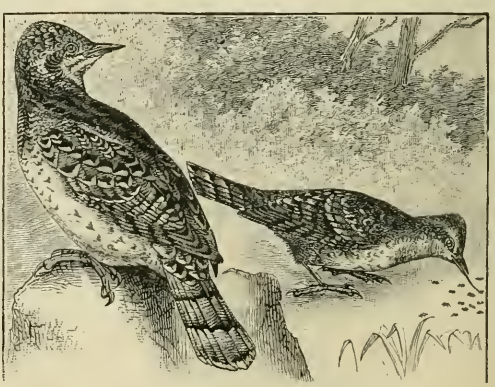
See books cited at ALPHABET, INSCRIPTIONS, and PALÆOGRAPHY; the articles CUNEIFORM, HIEROGLYPHICS, QUIPU, RUNES, SHORTHAND; the articles on A, B, C, and the other letters; and specimens at ARABIA, ARMENIA, BURMA, CHINA, ETHIOPIC, HEBREW, IRELAND (p. 208), MOABITE STONE, &c.

Writing-machines. See TYPE-WRITER.

Wrongous Imprisonment. See IMPRISONMENT, HABEAS CORPUS.

Wroxeter, a village of Shropshire (pop. 500), on the Severn, 6 miles SE. of Shrewsbury. It occupies the site of the Roman *Uriconium*, an important station on Watling Street (q.v.). At Uriconium part of the wall (once 3 miles in circumference) with ditch and rampart still exists, and the place has yielded many and various Roman remains, excavations having been carried on during 1859–67. See T. Wright, *Uriconium* (1872).

Wryneck (*Yunx*), a genus of birds of the Woodpecker family (Picidæ), having a short, straight, conical beak; a long extensile tongue, with a horny point; wings of moderate size; a rather short and rounded tail; the feet with two toes in front, and two behind. One species, the Common Wryneck (*Y. torquilla*), is a regular spring visitor to England and the north of Europe.



Wryneck (*Yunx torquilla*).

From its appearing at the same time with the cuckoo, it has acquired the name of *Cuckoo's Mate*, or *Cuckoo's Leader*. It has been found as far north as Caithness, the Orkneys and Shetlands, and the Faroes. It has also been found in Ireland. It is about 7 inches long, of a rusty ash colour, irregularly spotted with brown and black. It feeds on caterpillars and insects, and is often seen on the ground near ant-hills, feeding on the ants and their 'eggs.' The construction of its tongue resembles that of woodpeckers, and enables it to seize its insect prey with wonderful celerity; the tongue, which is covered with a glutinous secretion, is darted out and retracted so that the eye can scarcely follow it, the two posterior branches of the bones of the tongue being much elongated, and muscles for its extension attached to them.

The wryneck generally makes almost no nest, but deposits its eggs on fragments of decayed wood in a hole of a tree. The young birds are easily tamed, and are great favourites with boys. In France boys tie a string to one of the legs of the bird, and allow it to climb trees in search of insects. The name wryneck is derived from the bird's habit of writhing its head and neck quickly in various directions, with an undulating snake-like motion, which it does particularly if found in its hole in a tree, making at the same time a hissing noise, to alarm the intruder; but on his drawing back it suddenly darts out and escapes.

Wu-chang. See HANKOW.

Wudwan (*Wadhwán*), a native state in the Indian division of Kathiawar. Area, 237 sq. m.; pop. nearly 50,000, mostly Mohammedans. The capital, Wudwan, 110 miles NW. of Baroda by rail, has some trade and a pop. of 17,000.

Wu-hu, a Chinese treaty port in An-hui, near the Yang-tsze, 50 miles above Nanking; pop. 72,000.

Wullenwever. See LÜBECK.

Wulstan, or WULFSTAN, (1) a monk of Winchester in the 10th century, author of a Latin prose life of Bishop Ethelwold, and a poem in Latin hexameters on the Miracles of St Swithin.—(2) An Archbishop of York, in 1003, author of two pastoral letters and several homilies in Anglo-Saxon, the most remarkable of which is printed in Hickes's *Thesaurus*, vol. iii. See *Ueber die Werke des altengl. Erzbischofs Wulfstan* (Weimar, 1882), by Prof. A. Napier, who has also edited the Homilies (Berlin, 1883).—(3) The well-known Bishop of Worcester, and a saint of the English calendar. He was born at Icentun in Warwickshire about 1007, and educated at Evesham and Peterborough. He became a priest, afterwards a monk and prior of the monastery of Worcester, and ultimately in 1062 bishop of that see. He lived through the troubles of the Norman Conquest, enjoyed the favour not only of the Conqueror, but of William Rufus, and died in 1095, at the age of eighty-seven. He is by some reputed the author of the portion of the Anglo-Saxon Chronicle which extends from 1034 to the death of the Conqueror. His Life was written by William of Malmesbury (Wharton's *Anglia Sacra*, vol. ii.).

Wundt, WILHELM MAX, physiologist and philosopher, was born 16th August 1832 at Neckarau in Baden, and, after lecturing at Heidelberg and Zurich, went to Leipzig in 1875 as professor of Physiology. He is distinguished in the field of experimental psychology, and has written a long series of works on the nerves and the senses, the relations of physiology and psychology, logic, &c.

Wupper, or WIPPER, a tributary of the Rhine, which enters on the right bank between Cologne and Düsseldorf. The river, about 40 miles in length, has a strong current, and is used as motive power by hundreds of mills, so that the Wupperthal, especially that part of it which contains the towns of Barmen (q.v.) and Elberfeld (q.v.), is one of the most populous and industrial in Germany. The religious zeal of the inhabitants, and their interest in missions, are conspicuous.

Würtemberg, a kingdom of Germany, lying between Baden on the west and Bavaria on the east, and touching Switzerland (Lake of Constance) on the south. It entirely surrounds Hohenzollern, in which state, as well as in Baden, it owns several detached portions of territory. Area, 7529 sq. m. (a little larger than Wales); pop., which is nearly stationary, 2,080,898 in 1895. Chief town, Stuttgart (q.v.); Ulm, Heilbronn, Esslingen, and Cannstatt have each more than 20,000 inhabitants. The Black Forest, rising to 3776 feet, lies along its western boundary; whilst the Swabian Alb (3327 feet) stretches right across the country from west to east, forming the watershed between the Neckar and the Danube, the principal rivers of the kingdom; the northern portions belong to the Bavarian plateau. Mineral springs are plentiful. The numerous fertile valleys, favoured by a genial and temperate climate, produce wine and fruit in abundance. The breeding of live-stock is of more than average importance, 18½ per cent. of the area being grass and meadows. Forests occupy some 31 per cent. of the area. Iron, salt, and turf are extracted. The industries, varied and extensive, employ 41 per cent. of the population, the more notable branches being gold and silver work, hardware, iron-casting, machinery, philosophical and musical instruments, watches, bricks, chemicals, toys, printing and publishing, paper, tanning, brewing, silk and wool spinning, embroidery, &c. The country has for many ages been noted for its high educational standard. The national university is at Tübingen; Stuttgart is the seat of an excellent polytechnic, Hohenheim of an agricultural academy. Of the total population 68 per cent. are Protestants.

The hereditary sovereign is assisted by two houses of parliament, one an assembly of princes and the heads of certain noble families; the other consisting of twenty-three privileged members and seventy elected directly by the people for a period of six years. The national income and expenditure balance at about £3,600,000 per annum; the national debt amounts to £23,000,000, nearly all incurred for building railways. Famous Würtembergers were Schiller, Uhland, Wieland, Hauff, Kerner, Œcolampadius, Schelling, Hegel, Baur, Strauss, Kepler, Dannecker, &c.

Würtemberg, then occupied by the Suevi, was conquered in the 1st century by the Romans. In the 3d century it was overrun by the Alemanni, who in their turn were subdued by the Franks. The Frankish emperors included part of their territories in the Duchy of Swabia, and eventually, in or before the 13th century, conferred upon a local family the dignity of Counts of Würtemberg. Count Eberhard the Illustrious (1279–1325) greatly extended the possessions and power of the family, and made Stuttgart his principal residence. Eberhard II. (1344–92) waged a long and finally successful feud against the towns of the Swabian league. From 1442 to 1482 the county was divided between two branches of the family; but in 1495 Count Eberhard V. (1480–96) was created a duke of the empire. Ulrich (1498–1552), who began to rule when only sixteen, is perhaps the best known of the dukes: his extravagance and love of display occasioned the 'Poor Conrad' peasant revolt (1514); he caused Ulrich von Hutten's cousin to be slain, whereby he roused a host of enemies —the knightly orders of the empire, the Bavarian dukes, the towns of the Swabian league, and the emperor. The ban of the empire being proclaimed against him, he was driven into exile. On his return he introduced the Reformation into his duchy; and the policy thus begun was energetically furthered by Ulrich's son Christopher (1550–68), who was likewise the author of important legislative reforms. During 1547–99 Würtemberg was constrained to rank as a fief of the Austrian royal house. Though it took no direct part in the Thirty Years' War until 1634, the country suffered very greatly from the various hostile armies, especially the Imperialists, and it took all the energy and statecraft of Duke Eberhard III. (1628–74) to repair the damages and recuperate the resources of his country. Under Eberhard Ludwig (1677–1733) the French, in repeated invasions, helped the mistresses of the extravagant duke to impoverish the land anew; nor did his

cousin and successor do anything to improve its condition. Karl Eugen (1737–93), the next duke, aped Louis XIV., built castles, waged war against Frederick the Great, violated the constitution by arbitrary acts, but did much in his later years to foster education and science. Frederick II. (1797–1816) brought upon himself the vengeance of Moreau in 1800, but on going over to the French was rewarded with 850 sq. m. of new territory and an addition of 125,000 subjects, as well as the dignity of Elector. In the war that Napoleon began against Austria in 1805 the Elector of Würtemberg threw in his lot with the French, and his troops fought on that side down to 1813; in return for which he acquired the kingly title and an increase of territory that more than doubled the number of his subjects. The reign of the next sovereign, King William I. (1816–64), was chiefly occupied with the reorganisation of the new state and in the political conflicts that grew out of the democratic movements of 1848–49. Throwing in her lot with Austria in 1866, Würtemberg was beaten at Königgrätz and Tauberbischofsheim, and her king (Charles, 1864–91) compelled to purchase peace from Prussia at the cost of an indemnity of £800,000. The successes of 1870–71 against the French called forth a more friendly feeling towards Prussia, and led to Würtemberg's incorporation in the new German empire.

See the official *Das Königreich Württemberg* (3 vols. 1882–86); and P. Stälin, *Geschichte Württembergs* (1882 *et seq.*).

Wurtz, Charles Adolphe (1817–84), a great French chemist, a native of Strasburg, from 1844 a resident in Paris. He is author of numerous works on chemistry, of which *The Atomic Theory* (1880) and *Modern Chemistry* (by Greene, Philadelphia, 1879; 4th ed. 1885) have been translated into English. See his Life by Gautier (Paris, 1884).

Würzburg, capital of the Bavarian province of Lower Franconia, in a beautiful valley on both sides of the Main, 70 miles SE. of Frankfort by rail. Among the public buildings the most distinguished are the Episcopal Palace (1720–44), one of the most magnificent royal residences in Germany, and the spacious and excellently fitted-up Julius Hospital (1576), the university buildings, the town-hall, &c. The fortress of Marienberg, built on the site where Drusus founded a castle, is situated on a hill 400 feet high, on the left bank of the Main, and was till 1720 the episcopal residence. Of the numerous churches the most worthy of notice are the richly decorated cathedral, which was rebuilt in the 11th and following centuries, with beautiful chapels and monuments of the bishops; the Marien-kapelle, one of the most beautiful monuments of old German art, with fourteen statues of the 15th century; the university church; and the Neumünster Church, containing the bones of the Irish patron saint of Würzburg, St Kilian, and of Walther von der Vogelweide. In front of the Julius Hospital there is a bronze statue of the founder, Bishop Julius, who also in 1582 founded the university (an older one dating from 1403 having had but a short existence). The hospital was put in connection with the university, which has all along kept the medical faculty in high reputation, and promoted the prosperity of the university as a whole. There are 75 professors and teachers and 1500 students—more than half of them medical students. The library has above 100,000 vols. There are also a notable musical school, Catholic seminaries, &c. There are manufactures of tobacco, furniture, machinery, surgical and scientific instruments, railway carriages, lamps, vinegar, wine, beer, and iron. Pop. (1880) 51,014; (1890) 60,844.

Würzburg (Lat. *Wirceburgum*) was long the capital of a sovereign bishopric of the German empire, founded in 741 by St Boniface, whose bishops held the title of Dukes of Franconia, though in spiritual matters they were under the Archbishop of Mainz. The area of the bishopric was upwards of 1800 sq. m., with a pop. of 250,000. At the peace of Lunéville (1801) the bishopric, like the other spiritual principalities of Germany, was secularised; and in 1803 the greater part of it was conferred on the Elector of Bavaria. In 1805 Bavaria gave up Würzburg to the Grand-duke Ferdinand of Tuscany, and the principality was raised to the dignity of an electorate. But at the Vienna Congress it reverted to Bavaria. The campaign of the Prussian army of the Main ended with an action here in 1866, the fortress being bombarded; and since then Würzburg no longer ranks as a fortified place.

There are guidebooks by Heffner (1871) and Hubert (1882), and contributions to the history of the town and university by Scharold (1819), Oegg (1881), Urlichs (1878), Wegele (1882), and Cronthal (1888).

Würzen, a town of Saxony, on the Mulde, 18 miles E. of Leipzig by rail, with a 12th-century cathedral, an old castle, and manufactures of biscuits, carpets, felt, cigars, wire, &c. Pop. 12,006.

Wuttke, Heinrich, historian, born at Brieg in Silesia, February 12, 1818, became professor at Leipzig in 1848. He also took an active interest in politics, and had to the last a bitter enmity to Prussia. He died at Leipzig, 14th June 1876. Besides books devoted to the history of Silesia (1842–43, and 1847), the three years of war, 1756–58 (1856), Poland and Germany (1847), the battle of Leipzig (1863), William of Orange (1864), he began a great work on the history of writing, of which unhappily he only lived to publish the first volume, *Entstehung der Schrift* (1872). In 1879 appeared *Zur Vorgeschichte der Bartholomäusnacht.*

Wuttke, Karl Friedrich Adolf (1819–70), theologian, was born at Breslau, became professor at Berlin (1854) and at Halle (1861). His chief work is his *Christian Ethics* (1860–62; trans. New York, 1873). He was orthodox and high conservative, and wrote also a history of heathenism (1853) and a book on modern superstitions (1865).

Wyandots, a tribe of American Indians, related to the Iroquois, by whom they were nearly exterminated, the remnant emigrating to the country around Lake Superior. They furnished 400 warriors to the English in 1812, afterwards settled in Ohio, and in 1832 removed to Kansas.

Wyandotte, a city of Michigan, 12 miles SW. of Detroit; pop. 4000.

Wyandotte Cave, a vast cavern in Indiana, near the southern border, is next in size to the Mammoth Cave, which it excels in the multitude and magnificence of its stalactites and stalagmites. One apartment is 356 feet long by 250 high; one branch is 20 miles in length.

Wyatt, James, architect, was born at Burton Constable, Staffordshire, in 1746, studied in Rome, and succeeded Sir W. Chambers in 1796 as surveyor to the Board of Works. He built the fantastic pile of Fonthill Abbey for Beckford, and was killed near Marlborough by a carriage accident, 4th Sept. 1813.

Wyatt, Sir Mathew Digby, architect, was born in 1820 at Rowde near Devizes. After studying at the Royal Academy, he made a diligent study of the architecture of Italy, France, and Germany, returning to England in 1846 to publish his *Geometrical Mosaics of the Middle Ages* (1848). As secretary to the Royal Commissioners he took an important part in the arrangements of the 1851

Exhibition. In 1856 he was appointed architect to the East India Company, in 1866 awarded the royal gold medal of the Royal Institute of British Architects, and in 1869 knighted and chosen Slade professor of Fine Arts at Cambridge. He died 21st May 1877.

His chief books are *Metal Work and its Artistic Design* (1852), *Industrial Arts of the Nineteenth Century* (1853), *Art Treasures of the United Kingdom* (1857), *Fine Art* (1870), *Architect's Handbook in Spain* (1872).

Wyatt, Richard, sculptor, born in London 3d May 1795, became pupil of Charles Rossi, was afterwards a student of the Royal Academy, next studied at Paris under Bosio, and in 1821 went to Rome to the studio of Canova, where Gibson was a fellow-student, and where he died, 29th May 1850. His favourite subjects were classical and poetical. His figures always show excellent modelling, especially his female figures, whose grace and beauty are beyond all praise.

Wyatt, Sir Thomas, courtier and poet, was born in 1503 at Allington Castle in Kent, son of Sir Henry Wyatt, who stood high in favour with Henry VII., and later with his son. In 1515 he was entered at St John's College, Cambridge, where in due time he took his degrees of Bachelor and Master of Arts. He was warmly received at court, for he was one of the most accomplished men of his day, of a noble presence and fine manners, dexterous and subtle in the management of affairs, yet of spotless honour and integrity. In 1536 he was knighted, and the next year he was made high sheriff of Kent. He contrived to retain the hazardous favour of the king, and was frequently employed by him in positions of trust, as in missions to Spain, to the imperial court. In 1541 he was rewarded with a grant of lands at Lambeth, and the year after he was named high steward of the king's manor at Maidstone. He had now very much withdrawn himself from public life, and lived for the most part retired at Allington. On the 11th October 1542 he died of fever at Sherborne. Among the other accomplishments of Wyatt was that of verse, which he seems to have begun to cultivate early, and continued through life to practise. During his life he had acquired considerable reputation as a poet; and in 1557 his poems, along with those of Surrey, were published in *Tottel's Miscellany* (ed. by Arber, 1870). As marking a stage in the progress of our early literature they hold a permanent place. His love poetry is somewhat overrun with conceits derived from the study of Italian models; but some of the shorter pieces are models of grace and elegance. His satires also possess considerable merit.

His poems, together with those of Surrey, were edited by Dr G. F. Nott (2 vols. 4to, 1815–16), and there is an American edition (Bourbon, 1889), whose editor seeks to show that Anne Boleyn was the object of Wyatt's love. See also a monograph by Rudolf Alscher (Vienna, 1886).

Wyatt, Sir Thomas, surnamed the Younger, to distinguish him from the preceding, of whom he was the only son, was born about 1520. After a wild and riotous youth, he raised a body of men at his own expense, and did good service at the siege of Landrecies (1544), displaying considerable military talent; and he continued in honourable service on the Continent till 1550. In 1554, when the Spanish match was in agitation, Wyatt, in co-operation with Lady Jane Grey's father, led the Kentish men to Southwark, after gaining considerable successes over the royalists; but failing to capture Ludgate, he became separated from the main body of his followers, and was taken prisoner, and soon after executed, 11th April 1554.

Wyborg. See Viborg.

Wych Elm. See Elm; also Witch-hazel.

Wycherley, William, was the eldest son of Daniel Wycherley, a Shropshire gentleman of good family and some property, and was born in the village of Clive, near Shrewsbury, about the year 1640. In early youth he was sent to France, where he was admitted to the circle of the Précieuses of which the celebrated Duchess de Montansier, the beautiful daughter of Madame de Rambouillet, was queen. The duchess is said to have gained over young Wycherley to the Roman Catholic faith, but on returning to England and becoming a fellow-commoner of Queen's College, Oxford, he was reconverted to Protestantism by Dr (afterwards Bishop) Barlow. He left college without taking a degree and entered at the Middle Temple, where he acquired as much legal knowledge as sufficed for the happy portrayal of a litigious widow in his comedy of *The Plain Dealer*. For some years he lived gaily as a man about town and a courtier, and he began early to work as a dramatic author, but the dates at which his comedies were written are uncertain. 'The chronology of Wycherley's plays,' says Pope, 'I am well acquainted with, for he told it me over and over. *Love in a Wood* he wrote when he was but nineteen; *The Gentleman Dancing-master* at twenty-one; *The Plain Dealer* at twenty-five; and *The Country Wife* at one- or two-and-thirty.' If this statement be correct, the plays must have been written about the years 1659, 1661, 1665, and 1671. They abound, however, in allusions which could not possibly have been made in these years, and they must either have been in a great measure rewritten after the dates given by Pope, or more probably Pope was in error regarding them. The question, however, is one of no great moment. *Love in a Wood, or St James's Park*, a brisk comedy of hide-and-seek, founded on Sir Charles Sedley's *Mulberry Garden*, was acted with much applause in 1672, and its handsome witty author became for a time one of the most popular men in town. He rose into special favour with 'her graceless grace,' the Duchess of Cleveland, with the Duke of Buckingham, and with the king. The duchess, according to Voltaire, used to visit him in his chambers at the Temple, 'dressed like a country-maid, in a straw hat, with pattens on, and a box or basket in her hand;' Buckingham gave him a commission in a regiment; and Charles went to see him while he lay fever-stricken in Bow Street, made him a present of £500, and at one time wished to appoint him tutor to his son, the Duke of Richmond. Wycherley served for a short time in the fleet, like Dorset and many other young men of rank and fashion of that day, and was present at a sea-fight which may have been the battle gained by the Duke of York over Opdam in 1665, but was more probably one of the drawn battles fought between Rupert and De Ruyter in 1673. *The Gentleman Dancing-master*, a cleverly constructed farcical comedy of intrigue, was produced in 1673. *The Country Wife*, Wycherley's coarsest but strongest play, partly founded on Molière's *École des Femmes*, was brought out in 1675, and was followed in 1677 by *The Plain Dealer*, founded partly on Molière's *Misanthrope*. A little after 1679—the date is uncertain—Wycherley married the Countess of Drogheda, a young and handsome widow, with whom he lived unhappily, though his wife appears to have been sincerely attached to him. At her death she left him all her fortune, a bequest which involved him in a law-suit whereby he was reduced to poverty and then cast into the Fleet prison. There the ex-favourite of Charles remained for some years, while his comedies were being repeatedly performed to delighted audiences. At last James II. happened to witness a representation of *The Plain Dealer*, and was so impressed

by the character of the hero, the surly sea-captain, Manly, that he set free the author by paying his debts, and awarded him a pension of £200 a year. At the age of sixty-four Wycherley made the acquaintance of Pope, then a youth of sixteen, who for a time paid court to him assiduously, and to whom he entrusted the revision of a number of his verses. Pope set about the task in a manner better calculated to improve the lines than gratify their author, the natural result being a quarrel, followed by expressions of esteem on both sides, but by no renewal of intimacy. Wycherley's money troubles continued to the end of his days, even his succession to his estate failing to set him completely free. At the age of seventy-five he married a young woman, in the hope that he could thereby make certain legal arrangements which would balk the hopes of his heir, a nephew whom he disliked. He died eleven days after his marriage, in December 1715, and was buried in the vault of Covent Garden church. According to Pope, he died in the Roman Catholic faith. Leigh Hunt was very probably right in saying that Wycherley was a better man than he seems in his printed works. In his lifetime he was highly spoken of for his sincerity and goodness of heart, and was known among his associates as 'Manly Wycherley'—a title of which he certainly showed himself worthy by his courageous adherence to the Duke of Buckingham when that noble had fallen into disgrace with the king.

Few writers have been at once so unsparingly condemned and so highly praised as Wycherley. Macaulay pronounced him worthless alike as a man and as a dramatist—Wycherley it must be remembered was a pensioner of James II.—while Sir Walter Scott praised his 'strong and forcible painting,' set his *Plain Dealer* in some respects above Molière's *Misanthrope*, and declared that he stood aloof from the other dramatists of the Restoration in that he upheld the standard of the Jonsonian school. *The Way of the World*, says Mr Swinburne, is one of the glories, *The Country Wife*, one of the disgraces of English literature. *The Country Wife*, says Hazlitt, will do its author never-ceasing honour. The play, in truth, excites alternate admiration and disgust. The hero is an outrage at once on decency and probability, but the heroine is a triumph. In literary brilliance Congreve of course infinitely outshines Wycherley, but Wycherley is a far more dexterous playwright. He does not sacrifice action to epigram, he never confounds the closet with the stage. There are scenes in *The Country Wife* where it would be hard to overpraise the ingenious, startling turns of the plot, the natural evolution of the situations, the irresistible bustle and rattle of the action. Purged of the imbecile nastiness with which it is defiled, it has proved one of the best acting plays ever set on the stage. Wycherley's style is vigorous and pointed, though it lacks the raciness of Vanbrugh's and the ease and dash of Farquhar's, no less than the exquisite modish grace of Congreve's. There is a curious strain of inconsistency in his work which marks it off from the work of the other Restoration dramatists. If he sins more grossly alike against morality and art than Congreve or Vanbrugh or Farquhar, his work nevertheless betrays an earnestness of purpose, a sincere and even morose indignation against certain forms of vice, of which there is no sign in all their graceless, sparkling revel of raillery and intrigue. No one, said Hazlitt, could read his *Plain Dealer* without being the better for it through life. He is a writer whom it is very difficult to judge fairly; but to brush him aside as a mere worn-out example of the depraved dramatic taste of a day is to show either that one has no first-hand knowledge of his work, or that one is blind to admirable stage-craft and skilful characterisation, to the sparkle of genuine wit and the play of genuine humour, though the wit is often hard and deliberate and the humour often coarse and cold.

See *The Works of Wycherley, Congreve, Vanbrugh, and Farquhar* (edited by Leigh Hunt, 1 vol.); Hazlitt's *English Comic Writers;* and Ward's *History of English Dramatic Literature* (Lond. 1875).

Wycliffe, JOHN (whose family name is also spelt *Wyclif, Wiclif, Wickliffe*, and in some thirty other ways), is believed to have sprung from a family which held the manor of Wycliffe on Tees, and to have been born at Hipswell, near Richmond, Yorkshire, about 1325. Of his early life we know nothing, except that he distinguished himself at Oxford, where he was a popular teacher. The first authentic mention of his name is in 1360, when he was master of Balliol College. He resigned the mastership soon afterwards on taking the college living of Fillingham. This he exchanged in 1368 for Ludgershall, Buckinghamshire, probably to be nearer Oxford, where his chief interests centred. Meanwhile he had for a short time held the wardenship of Canterbury Hall, having been appointed by Archbishop Islip, and deprived by Islip's successor, Simon Langham. These changes involved the question whether the hall should belong to monks or to secular priests, and Wycliffe attempted to defend his position, but after three years' litigation the papal court decided against him.

Wycliffe was already known beyond the university, and held some office, probably that of royal chaplain, at court, where he was consulted by the government, and occasionally employed as a pamphleteer. Thus on one occasion we find him defending the refusal of tribute demanded by the pope, and on another writing an apology for John of Gaunt as to infringement of the right of sanctuary in Westminster Abbey. In 1374 he was presented by the crown to the rectory of Lutterworth (q.v.), and later in the same year was sent as a commissioner to Bruges to treat with ambassadors from the pope concerning provisions and reservations of ecclesiastical benefices, abuses that caused much indignation in England. Wycliffe was no doubt chosen as a recognised opponent of papal intrusion, but less zealous colleagues were associated with him, and nothing of importance was accomplished. On his return he was appointed to a prebend at Westbury, which he at once resigned, probably because he could not consistently hold such preferment.

The next years were full of strenuous activity, which gained him support among the nobles and the London citizens. As yet the chief error charged against him was his maintenance of a right in the secular power to control the clergy and even to withdraw endowments. Such teaching was specially offensive at a time when a party among the nobility, headed by the Duke of Lancaster, was endeavouring to exclude churchmen from the great offices of state which they had been accustomed to hold. The resentment of the bishops showed itself in a summons to Wycliffe to appear before the archbishop in St Paul's, on February 19, 1377. He obeyed, but before the council could get to business it was broken up by an unseemly quarrel between the Bishop of London and the Duke of Lancaster. The pope now took the matter in hand, and in May addressed a series of bulls to the king, the bishops, and the university of Oxford, bidding them to imprison Wycliffe and make him answer before the archbishop and the pope. It was several months before any attempt was made to obey the pope's commands, and when at last some half-hearted proceedings were undertaken, they were interrupted by a mob and put an end to by an order from the young king's mother. The

prosecution had little effect upon Wycliffe's position, for while it was going on he was consulted by the Great Council as to the right of forbidding the papal agents to take money out of the realm.

The whole fabric of the church was now (1378) shaken by the election of a second pope; the spiritual allegiance of Europe was divided, and the shock was increased by the scandalous methods to which the rivals resorted in their strife. The schism affected Wycliffe deeply. Hitherto he had attacked the manifest abuses in the church, but he now began to strike at its constitution, and declared that it would be better without pope or prelates. He denied the priestly power of absolution, and the whole system of enforced confession, of penances, and indulgence, that was bound up with it. Up to this time his controversial works had been written in Latin, and couched in the scholastic forms of which he was a master; he now appealed to the people in their own language, and began to issue the series of popular tracts which gained him the distinction of being the first writer of English prose. He organised a body of itinerant preachers, his 'poor priests,' who spread his doctrines widely through the country, and, most important of all, he began his translation of the Bible, of which as yet there was no complete English version. The work seems to have been carried through rapidly with the aid of his disciples, and was extensively circulated. See BIBLE, p. 127.

Thus far his novel views had met with much acceptance both among the gentry and the people, but he entered upon more dangerous ground when in 1380 he assailed the central dogma of transubstantiation. A convocation of doctors, called together by the chancellor of Oxford, condemned his theses and forbade him to maintain them in the university. He refused to obey, and appealed to the king, but the court was not prepared to defend formal heresy. In 1382 Archbishop Courtenay convoked a council at the Blackfriars' Convent and condemned Wycliffite opinions as represented in twenty-four theses. Wycliffe's followers were arrested, and after some time were all compelled to recant. For some unknown reason Wycliffe was not judged. He withdrew from Oxford to Lutterworth, where, in spite of a stroke of paralysis, he continued his incessant literary activity. His work in the next two years, uncompromising in tone, is astonishing in quantity, and shows no falling off in power, but on the 28th December 1384 he was again struck with paralysis, and died on the 31st. He had received a summons to appear before the pope, but had excused himself mainly on the ground of ill-health.

The characteristic of Wycliffe's teaching was its insistance on inward religion in opposition to the formalism of the time. As a rule he attacked the established practices of the church only so far as he thought they had degenerated into mere formal or mechanical uses. Thus he admits that confession may commonly be useful, and that in such cases it is a duty to resort to it, but maintains that it is a matter that rests with a man's conscience. The law which enforced confession once a year made it, he thought, a matter of form, and gave an opportunity of mischief to bad or incompetent priests. He allowed the use of images as an incentive to devotion, but denounced as idolatrous any regard for the image itself. In like manner he maintained the duty of receiving all the ordinances prescribed by the church, while saying that under special conditions they may be dispensed with, as 'God is not bound by sensible sacraments.' There has been much misapprehension of his celebrated doctrine of 'dominion as founded in grace.' According to this no one has true dominion over anything unless he is in a state of grace. This has been supposed to mean that the truly religious have a right to seize all possessions, and has been naturally scouted as subversive of society. But with Wycliffe the doctrine was purely ideal. Lordship, he says, has nothing to do with civil possession, but in the truest sense everything belongs to him for whom all things work together for good, while the wicked has no real lordship over possessions that only help him to final condemnation. The practical value of the doctrine lay in its appeal to the conscience; by an analogy with the feudal law he tried to bring home to every one his responsibility to God as his chief lord. Of the personal appearance and demeanour of Wycliffe we know little, and his portraits cannot be relied on as authentic. We are told that he was thin and worn, and that he added to wide accomplishments a charm of manner which won the regard of all with whom he had to do. His bitterest opponents had no charge to bring against his character, and his courage is shown by the frankness with which in his latest writings he maintained his opinions, although they had been publicly condemned. The influence of his teaching was wide-spread in England, and, though persecution prevented its appearance, it continued to work up to the time of the Reformation. It was manifested more strikingly in Bohemia, where Huss (q.v.) avowed himself an admirer and pupil of Wycliffe, large parts of whose works he adapted and published as his own. Thirty years after Wycliffe's death forty-five articles extracted from his writings were condemned as heretical by the Council of Constance, which ordered the bones of the heretic to be dug up and burned, a sentence executed thirteen years later.

Poole's *Wycliffe and Movements for Reform* (1889), Loserth's *Wyclif and Hus* (1884), L. Sergeant's study (1892), G. M. Trevelyan's *Age of Wycliffe* (1899), and works cited at LOLLARDS.

Wycombe, a market-town of Buckinghamshire, stands, surrounded by beech-clad hills, on the Wye, a small feeder of the Thames, 25 miles ESE. of Oxford and 29 (by rail 34½) WNW. of London. Called variously Chipping (or Chepping) Wycombe and High Wycombe, it was the seat of a Saxon fortress, Desborough Castle, some remains of which may be seen, and has a fine cruciform parish church (1273–1522; restored 1874–88) with a tower 96 feet high, a guildhall (1757–1859), a literary institute (1854), a free library, a hospital (1875, endowed and enlarged with the balance of the Beaconsfield Memorial Fund), a grammar-school (1555; new buildings, 1883), and an auction-mart (1887). Lace is made, but the staple manufacture is that of beech-wood and other chairs—between one and two millions annually—with latterly whole furniture suites of a very high character. There are also some large paper-mills in the town and district. Hughenden and Chalfont, both noticed separately, are near. Wycombe, which returned two members till 1867, and then one till 1885, was governed by a mayor in Henry III.'s time, but first incorporated by Henry VI.; the municipal boundary was extended in 1880. Pop. (1881) 10,618; (1891) 13,435.

See works by Thomas Langley (1797), H. Kingston (1848), and John Parker (1878).

Wye, a river of Wales and England, of great picturesque beauty, an affluent of the Severn, has its origin in two copious springs which issue from the south-east side of Plinlimmon, not 2 miles from the head-water of the Severn (q.v.). It thence flows 150

miles in a generally south-east direction through or along the borders of the counties of Montgomery, Radnor, Brecknock, Hereford, Monmouth, and Gloucester, till it enters the Severn's estuary below Chepstow. At Chepstow the tide has been known to rise 47 feet above low-water mark. The chief affluents are the Lug and Ithon on the left, and the Monnow, the Caerwen, and Irfron on the right. Fly-fishing for salmon has suffered much from netting at the mouth; and the Wye is not much of a boating river, though a pair-oar has been rowed down it from Boughrood, above Hereford. The part of the river separating Monmouth from Gloucester is that chiefly visited for its singular beauty.

See CHEPSTOW, TINTERN, ROSS, &c., and works by W. Gilpin (1782), C. Heath (1800), L. Ritchie (1841), W. and M. Howitt (1863), and G. P. Bevan (1887).

Wykeham, WILLIAM DE, was one of those ecclesiastics who from small beginnings rose to almost princely power. Froissart says that in his day 'everything was done by him and nothing without him.' So obscure was his origin that there has been a controversy as to what was his surname. His mother, Sibilla, was the granddaughter of the 'Lord of Stratton,' but his father was a yeoman called John Longe, perhaps on account of his stature. He was known as 'William,' born in 1324 at Wickham—a small Hampshire village, 3 miles from Fareham. The place was sometimes called Wickham-Scures from the family to whom it belonged; and Sir John Scures, who was almost the viceroy of the southern counties, took a liking to William and sent him to the Prior's school at Winchester. There he learned French, some Latin, arithmetic, and geometry. On his leaving school Sir John appointed him his secretary, and introduced him to Bishop Edington, who presented him to Edward III. In 1351 Sir J. de Broeas was in a commission for repairing Windsor Castle, and Wykeham's first important work was that of assisting in the construction of the Round Tower. He was appointed surveyor of Windsor and other royal castles in 1359, built Queensborough Castle in 1361, was Keeper of the Privy-seal and secretary to the king in 1364, and in 1367 was consecrated Bishop of Winchester and Chancellor of England. Towards the end of Edward III.'s reign he, and many others, had some differences with the Duke of Lancaster and Alice Perrers, but he found means to conciliate her and proceed with the founding of his colleges. In 1380 New College, Oxford, was commenced, and in 1387 Winchester School was begun, which was finished in 1393. Next year, when seventy years of age, he undertook the transformation of the nave of Winchester Cathedral, personally supervised the work until the last two years of his life, and probably drew his own plans. The money he laid out on building would altogether represent half a million at the present time. In 1404 he finished his magnificent chantry at Winchester, and, dying in that year, was buried in it, on the spot where as a boy he used to kneel before the figure of the Virgin. He regarded Mary as his especial patroness, and dedicated both his colleges to her. Wykeham held large church preferment, but had he lived later would probably have been merely a great architect. He was not an ardent theologian, and Wycliffe spoke lightly of him as 'a builder of castles.' But he was generous and religious—he founded his colleges 'first for the glory of God and the promotion of divine service, and secondarily for scholarship.' His famous motto was 'Manners'—i.e. morals—'maketh man,' and he carried out useful reforms at St Cross and in St Swithun's. In politics he was national as opposed to papal. At the close of his life he was present in the parliament when Richard II. was deposed, and in the first one held by Henry IV. He has been called the 'Father of the public-school system;' and although he did not invent the Perpendicular architecture, he established it, and saved the Gothic in England from the degeneracy it underwent abroad. His style of building can best be studied at Winchester. These relics of Wykeham remain at New College: an autograph letter, parts of his mitre, his silver Pastoral Staff (q.v.), silk gloves, and jewelled morse. In the British Museum are some charters in his handwriting.

See WINCHESTER and works there cited; and Lives by Lowth (1759; new ed. 1777), Chandler (1842), Moberly (1887), and Basil Champneys (*Art Journal*, 1888).

Wynaad, or WAINÁD (better Vayanád), a highland district, mainly a tableland, in the Western Ghâts, about 3000 feet above sea-level, and belonging partly to the Nilgiri district, partly to Malabar. The name is well known in England through the auriferous quartz almost universally distributed throughout the region, which began to be worked as a gold-field about 1865, and, after absorbing in 1876–86 millions of British capital, failed to fulfil the extravagant expectations formed.

Wynberg, a town on the SE. slopes of Table Mountain, 8 miles SE. of Capetown by rail, the centre of a rich wine-growing country; pop. 4000.

Wynkyn de Worde. See WORDE.

Wyntoun, ANDREW OF, an old rhyming Scottish chronicler, about whom we know only that he was a canon regular of St Andrews, who about 1395 became prior of the monastery of St Serf on Lochleven, and that he wrote *The Oryginale Cronykil of Scotland.* Though with the usual proportion of extravagant fable, his work is not without considerable historical importance; while philologically it has very distinct value, as a specimen of the old Scotch, then as nearly as might be identical with the contemporary dialect of England. The *Cronykil* is brought down to 1406, and consists of nine books or cantos, of which only the last four are devoted to Scottish history; the first five giving a fragmentary outline of the history and geography of the ancient world. From his quotations Wyntoun seems to have been a well-read scholar for his time. His style is not essentially different from Barbour's, and his versification is the same—the pleasant octosyllabic. David Macpherson edited the Scottish portion (2 vols. 1795); and a complete edition was published by David Laing in the 'Historians of Scotland' series (3 vols. 1872–79).

Wyo'ming, a north-western state of the American Union, ranking eighth in area and third lowest in population of all the states and territories, lies mainly on the eastern slope of the Rocky Mountains. It is bounded on the N. by Montana, E. by South Dakota and Nebraska, S. by Colorado and Utah, and W. by Utah, Idaho, and Montana. From east to west the length is 360 miles, and the width from north to south is 275 miles. Area, 97,890 sq. m. The state is traversed by the main axis of the Rocky Mountains, which constitutes the continental divide, and the greater part of it is a mountainous region. The northern group of the Rocky Mountain system finds here its greatest development, and is noted for its wild and rugged character and for its picturesque scenery. In the west central part are the Wind River Mountains (see UNITED STATES), in the north central part the Big Horn Mountains, in the extreme north-east the Black Hills extending into South Dakota, in the south-east the Laramie Range, in the south the Medicine Bow Mountains, north of which are the Sweetwater and Rattlesnake ranges, and in the west the Teton, Shoshone, and Gros Ventre ranges. Among the principal peaks are Frémont's Peak (13,790 feet), Mount Hayden (13,691 feet),

Snow's Peak (13,570 feet), Wind River Peak (13,499 feet), Mount Chauvenet (13,000 feet), Mount Hooker (12,900 feet), Mount Moran (12,800 feet), and Washakie Needle (12,253 feet). The Yellowstone (q.v.) National Park, 3600 sq. m. in area, occupies the north-western corner, and is mainly within the limits of this state. The mountains are covered with forests of considerable extent, occupying one-eighth of the total area. Interspersed between the ranges are broad plateaus with arable soils, which with proper irrigation yield prolific crops; but less than one-sixth of the state altogether is estimated to be capable of cultivation. Wyoming is essentially a grazing country, and at present supports over 1,500,000 cattle, and 1,000,000 sheep. The mean elevation of the plateau regions is from 7000 to 8000 feet. Yellowstone Lake has an altitude of 7778, Lewis Lake 7750, and Shoshone Lake 7670 feet above the level of the sea. The south-western portion of the state slopes towards the Pacific Ocean and forms a part of the Green River valley. The eastern part of the state is drained by tributaries of the Missouri, the western by the Snake or Shoshone River, which ultimately joins the Columbia, and in the south-west is the Green River, which eventually discharges its waters into the Colorado. In the mountain regions are deposits of gold and silver and ores of copper and iron. Near Evanston, Carbon, and Rock Springs, and in some other localities, there is found a superior quality of soft coal in great abundance. These deposits are extensively worked, and furnish fuel for nearly all the railroads and for the towns and settlements of the state. The state also possesses valuable deposits of soda, some tin, abundance of limestone, and oil-wells. There are hundreds of thousands of acres of fine pasture-land in Wyoming where cattle may feed throughout the year. Nearly three-quarters of the area of the state is yet open for settlement under the Homestead (q.v.) laws. The climate is dry, although the country is well watered by streams. The summers are mild and delightful. In exposed regions the winters are severe, but in general the climate is conducive to health and comfort. Besides grazing, mining and agriculture are the leading industries. The state is divided into thirteen counties, and has one representative in congress. The chief towns are Cheyenne, the capital, Laramie, Rock Springs, Rawlins, and Evanston. Wyoming comprises portions of the territory acquired by the Louisiana Purchase of 1803, and of that obtained by the treaty with Mexico in 1848. A territory from 1868, it was admitted as a state in 1890. Pop. (1870) 9118; (1880) 20,789; (1890) 60,705; (1900) 92,531.

Wyoming Valley, a beautiful, fertile valley on the Susquehanna River, in north-eastern Pennsylvania, about 30 miles long by 5 wide, its name supposed to be a corruption of the Indian *Maughwauwama*—'large plains.' It was purchased (1754) by a Connecticut company from the Six Nations, but the settlers were soon dispersed by hostile savages. In 1769 forty pioneers came from Connecticut, but found a party of Pennsylvanians in possession, and for several years there were continual contests between the rival settlers, the Connecticut colony finally proving successful, and their town of Westmoreland growing to 2000 inhabitants. On June 30, 1778, when most of their men were serving or had fallen under Washington, a force of 400 British provincials, or 'Tories,' and 700 Seneca Indians, led by Colonel John Butler, entered the valley, and were opposed by 300 men, under Colonel Zebulon Butler. On July 3 the settlers were driven to the shelter of Fort Forty (named after the pioneers), with the loss of two-thirds of their number, many soldiers and inhabitants being murdered; a half-breed Indian woman, called Queen Esther, having, in revenge for her son's death, tomahawked fourteen prisoners with her own hand. On the 5th the remnant of the troops surrendered, and they and the inhabitants were either massacred or driven from the valley, which was left a smoking solitude. Campbell's *Gertrude of Wyoming*, founded upon this disaster, contains exaggerations and misstatements, notably that of attributing the leadership to Brant (q.v.), who was not in the expedition. The disputes between the Connecticut and Pennsylvanian settlers were not finally settled for several years after. The valley is now one of the most flourishing districts in the state, and very rich in anthracite coal.

Wyre Forest, in the north-west of Worcestershire, near Bewdley, forms the southern part of the Severn coalfield.

Wyss, Johann Rudolf, author of *The Swiss Family Robinson*, was born at Bern, 13th March 1781, became professor of Philosophy there in 1806, later chief-librarian also, and died 31st March 1830. His *Vorlesungen uber das höchste Gut* (2 vols. 1811), *Idyllen und Erzählungen aus der Schweiz* (3 vols. 1815–22), and the great collection of his editing, *Alpenrose* (20 vols. 1811–30), would hardly have preserved his name but for the idyllic simplicity, the vigour, and interest of *Der Schweizerische Robinson* (2 vols. 1812–13), which has been frequently translated—the 1st series into English in 1820, the 2d in 1849.

Wyttenbach, Daniel, a great Dutch scholar, born at Bern, 7th August 1746, studied at Marburg, Göttingen, and Leyden, became professor of Greek at the Remonstrant gymnasium at Amsterdam in 1771, of Philosophy at the Athenæum in 1779, and succeeded in 1799 to Ruhnken's chair of Rhetoric at the university. He retired in 1816, and died after some years of blindness at Ösgeest, 17th January 1820. His greatest work is the edition of Plutarch's *Moralia*, with rich annotations and an admirable *Index Græcitatis in Plutarchi opera* (Oxf. 8 vols. 1795–1830).

Other works are his *Præcepta philosophiæ logicæ* (1782), *Eclogæ seu selecta principum historicorum capita* (1793), *Vita Ruhnkenii* (1800), and an admirable edition of Plato's *Phædo* (1810). See Mahne's *Vita* (1823).

His wife, Johanna Gallien, a niece of Hanau, whom he married at seventy-two, was a remarkably accomplished woman. She lived after her husband's death at Paris, was given the degree of doctor in philosophy by Marburg in 1827, and died at Leyden in 1830. Among her writings were *Théagène* (Paris, 1815), *Das Gastmahl des Leontis* (Ulm, 1821), and the romance, *Alexis* (Paris, 1823).

Wyvern (from Lat. *vipera*), a fictitious monster allied to the dragon and the griffin, and frequently occurring in heraldry. It resembles a dragon, but has only two legs and feet, which are like those of the eagle.

X

the last letter in the pre-Ciceronian Roman alphabet, and the twenty-fourth in our own, is descended through the Greek *Xi* from *Samekh*, the fifteenth Semitic letter, whose Egyptian parentage is explained in the article ALPHABET (Vol. I. p. 187). The oldest form of *xi* was ⋿, which is almost identical in form with the Phœnician letter. In the eastern Greek alphabet the vertical stroke disappeared and the form became Ξ, which has the value of *x* in Greek. In the Chalcidian and Western alphabets the upper and lower crossbars disappeared, leaving the sign +, which afterwards became ×, to represent the sound of *x*. In the eastern Greek alphabet the unrelated sign ×, derived from another source, represented the sound *ch*. In the original Italic alphabet the letter must have existed, as is proved by its occupying, like *xi*, the fifteenth place, after *n*, in three ancient abecedaria recently discovered in Italy; but its position at the end of the Latin alphabet, *ultima nostrarum*, as Quintilian calls it, proves that it must have been disused and then afterwards re-adopted. It is found in an inscription written in 186 B.C., and in an undated inscription which may be some thirty years earlier. In modern English *x* has the value of *ks*, which it had in Anglo-Saxon; except at the beginning of a word, where it is pronounced like *z*. In Italian *x* has been replaced by *ss*, as in *massimo* for *maximus*. In French *ss* sometimes replaces *x*, as in *cuisse* and *laisser*, from *coxa* and *laxare*, while *us* may become *ux*, as in *yeux*, *eux*, *deux*, and *époux*. In Spanish *x* had the power of the German *ch*, but the Spanish Academy has decreed its replacement by *j*; Mexico, Xalapa, and Don Quixote being now spelt *Mejico*, *Jalapa*, and *Don Quijote*. As a numeral, X stands for ten (see NUMERALS); X as an abbreviation represents the word Christ (see CROSS)—hence Xian, Xmas; *x* in Algebra is the first of the unknown quantities; and the use of X, XX, and XXX on barrels of stout is a well-known way of indicating the quality.

Xanthin (Gr. *xanthos*, 'yellow'), a name given to the yellow colouring matter of various flowers, to a principle in madder, and to a deposit of urine.

Xanthippe. See SOCRATES.

Xanthoxylum, a genus of the Rutaceæ, comprising over one hundred species, of which many are found in Brazil and the West Indies. Of five found in the United States the best known is the Prickly Ash or Toothache Tree (*X. fraxineum*), the bark and its extracts being used for toothache and rheumatism, and also as a tonic. Some species are called Fustic, Pepper, Yellow-wood, &c.

Xanthus, the capital of ancient Lycia (q.v.), on the river Xanthus, 8 miles from its mouth. It offered a desperate but vain resistance to Cyrus' army under Harpagus, in 546 B.C., and again in 42 B.C. to Brutus. In ancient times it was rich in temples and sepulchral monuments, and extensive remains were discovered by Sir C. Fellows (q.v.).

Xavier, FRANCISCO, the 'Apostle of the Indies,' was born of a noble family at his mother's castle of Xavero or Xavier, near Sanguesa, in the Basque country, April 7, 1506, youngest son of Juan de Jasso, privy-councillor to Jean d'Albret, king of Navarre, and his wife Maria Azpilcueta Xavier. He was sent in his eighteenth year to the college of St Barbara at Paris, and was already a lecturer on the Aristotelian philosophy when he made the acquaintance of Ignatius Loyola (q.v.), with whom ere long he became associated in the foundation of the Jesuit Society (1534). Ordained priest at Venice in 1537, he lived some years at Rome in the service of the society. John III. of Portugal having resolved to send out members of the new order as missionaries to the Portuguese colonies in the east, Xavier was chosen in the place of Bobadilla, who was prevented from going by sickness. He sailed from Lisbon, April 7, 1541, wintered at Mozambique, and arrived at Goa, May 6, 1542. His first task was to rouse a spirit of penitence and religious fervour among the corrupt Europeans, and thus remove the great obstacle to the conversion of the native population. His efforts were eminently successful, and he was equally blessed in his labours among the pearl-fishing population of the coast. After a stay of more than a year in this region he returned to Goa, and with fresh assistants visited the kingdom of Travancore, where in a single month he baptised 10,000 natives. Passing thence to Malacca, he next proceeded in 1546 to the Banda Islands, to Amboyna, and the Moluccas, and then retraced his steps by Malacca (1547) and Manassar to the island of Ceylon, where he converted the king of Kandy with many of his people. His next ambition was the conversion of the Japanese empire, which had been suggested to him at Malacca by Han Siro, a Japanese exile. His preaching at Miako and Fucheo was attended with extraordinary fruits, and the splendour he had put on here from motives of policy so much impressed the Japanese that the mission he founded was allowed to flourish for above a hundred years. Xavier's mission to Japan occupied about two and a half years; he returned to Goa in 1552 to organise a mission to China. But the intrigues of the Portuguese merchants and the envious hatred of the governor of Malacca to Pereira, the envoy to China he had chosen, raised so many difficulties that his spirit gave way, and he sank under the combined weight of mental depression and physical sickness, on the very threshold of what he had looked to as the great enterprise of his life, in the island of Sancian, December 22, 1552. His body was conveyed to Malacca, and thence with great solemnity to Goa, March 15, 1554. Many miracles, attested by numerous witnesses, were reported of Xavier in almost all the stages of his career. Among these is reckoned the miraculous gift of tongues, and this was fortunate, for it appears that by nature he had no gift for languages. The evidence of these miracles was submitted to the usual process of inquiry at Rome, and, many miracles having been established, Xavier was beatified by Paul V. in

1619, and canonised by Gregory XV. in 1622, his festival being fixed upon 3d December.

His only literary remains are a collection of Letters, in 5 books (Paris, 1631), and a Catechism, with some short ascetic treatises. His Life, by Père Bouhours (1684), was translated by James Dryden, brother of the poet. There are also Lives in Latin by Torsellino (1596), in Italian, by Bartoli and Maffei (1653), in German, by De Vos (1877), and in English, by Venn (1862). H. J. Coleridge (1873), and Mary H. McClean (1896). See also Sir J. Stephen's *Essays in Ecclesiastical Biography* (1849).

Xebec. See SAIL.

Xenia, capital of Greene county, Ohio, on the Little Miami River, 65 miles by rail NNE. of Cincinnati, the centre of a rich agricultural district. It has a Methodist college, a normal school, a U.P. seminary, hospital, and the state Soldiers' and Sailors' Orphan Home. Pop. (1890) 7301.

Xenocrates, an ancient philosopher, was born at Chalcedon 396 B.C., and governed the Academy as successor to Speusippus, himself the successor of Plato, from 339 till his death in 314. He wrote numerous treatises upon dialectics, physics, and ethics, of which the titles only have been preserved; and what is known of his doctrines is gathered only from notices in various authors. He introduced into the Academy the mystic Pythagorean doctrine of numbers in connection with the *ideas* of Plato.

Xenophanes (fl. 540–500 B.C.), founder of the Eleatic School (q.v.).

Xenophon, Greek historian, miscellaneous essayist, and military commander (*c.* 435–354 B.C.), was son of Gryllus, an Athenian knight. The biography by Diogenes Laertius, and the scattered notices of him found in other ancient writings, together with the data supplied by his own *Anabasis*, are the only materials for his life. Little or nothing is known of the first thirty-five years which he spent at Athens, except that he came under the influence of Socrates from an early period. The tradition of his having been rescued by that philosopher at the battle of Delium, 424 B.C., which would carry back the date of his birth to 444–443, is probably apocryphal; at any rate it is inconsistent with his own statement about himself in the *Anabasis* (III. i. 25). In 401, the political situation of Athens offering no scope for his activity, he accepted the invitation of Proxenus of Bœotia—an old guest-friend and adventurer in command of a regiment of Hellenic mercenaries under Cyrus—to join him at Sardis and take service under the Persian prince in his military enterprise, directed ostensibly against the Pisidians, a refractory vassal tribe, but really against his own brother, King Artaxerxes Mnemon; but he went in a civil rather than a military capacity. It was only after the failure of this bold scheme of usurpation, and the death of the rebel prince in the affray between the two brothers in the plain of Cunaxa (Babylon), September 3, 401, that Xenophon became one of the regular officers, and finally the successor of Proxenus in the supreme command of the Ten Thousand Greeks left alone in the centre of the Persian empire, when five of their generals and twenty subordinate officers had been treacherously massacred in the enemy's camp, and there was a general break-up of the Cyreian Asiatic insurgents. Xenophon thereupon became the life and soul of the army in its march of 1500 miles, as they fought their way against the ferocious mountain tribes through the rugged highlands of Armenia and the ice and snow of an inclement winter, and conducted them with such skill, foresight, and prowess that in five months they were able to reach Trapezus (*Trebizond*), a Greek colony on the Black Sea, and ultimately Chrysopolis (*Scutari*), opposite Byzantium, on the Bosporus, in October 399. After further adventures and difficulties, they accepted service for a short time under Seuthes, a Thracian chief, who wanted their aid in recovering the kingly power, and finally recrossed to Pergamus, where Xenophon provided them with permanent service in the Lacedæmonian army under Thibron, who had been engaged to continue the war against the satraps Pharnabazus and Tissaphernes, for the deliverance of the Æolian Greeks from the Persian yoke. It is not certain what became of Xenophon after Thibron's recall—whether he went back to Athens, as it appears from vii. 7, 57, he intended; but the evidence seems to show that he continued with his successor Dercyllidas, and that the sentence of banishment for 'laconism'—in other words, attachment to the cause of a traitor in alliance with Sparta—was passed against him in 399, the year of the execution of his old friend and master, Socrates. If he did go back to Athens, he must have returned to Asia in 396, when a new epoch in his life began with the arrival of Agesilaus in command of a new Spartan army. With this great king Xenophon, who saw in him the ideal of a Greek hero, formed the closest friendship. He accompanied him in his eastern campaign, and was in his suite when he returned to Greece to conduct the war against the newly-formed anti-Spartan league of Athens, Corinth, and Thebes (394), and witnessed the battle of Coronea, of which he gives a graphic description (*Hell.* IV. iii. 16 ff.). Such disloyal and unpatriotic conduct may be explained, if not excused, by his political sentiments. Xenophon saw no hope for Athens, except in league with Sparta. If Athens and Sparta combined, then might Greece be mistress of the world. Hence his aversion for the democratic party at Athens, which was the chief hindrance to such an union. Xenophon accompanied the king to Sparta, where he resided on and off, until, in compensation for the loss of his country and in recognition of his services, the Spartans presented him with an estate at Scillus, one of the Triphylian towns taken from Elis (400), lying on the road from Lacedæmon to Olympia. Here in 387 he went with his wife Philesia and his two sons, Gryllus and Diodorus; here he spent some twenty years of his life, careless of war and politics, indulging his taste for literary work and the pursuits of a country gentleman. Here, too, were penned most of his important books. But the break-up of Spartan ascendency after the battle of Leuctra (371) drove him from his tranquil retreat to seek a home elsewhere. The Athenians, who had now joined the Spartans against Thebes, repealed the sentence of banishment against him, but he did not avail himself of this act of grace to return to his native place; he travelled towards it, but no farther than Corinth, where he took up his abode and lived to *c.* 355.

The writings which Xenophon has left behind him are not a bad index of his character; they give us the idea of having been written with great singleness of purpose, modesty, and love of truth. The leading feature of his character seems to have been an active susceptibility and admiration for all that is noble and beautiful. This trait will account for his faithful attachment to great personalities like Socrates, Agesilaus, and the younger Cyrus, and explain why in his narrative of particular actions or description of individuals he makes a point of presenting the bright side of things and concealing the dark, while in his philosophical works he brings on the scene almost exclusively noble and pleasant portraits. With this lovable trait he unites on the one hand a natural kindness and mildness of disposition, and on the other good sense, firmness, and courage. While his intercourse with Socrates and his studious habits

stimulated and elevated his higher nature, his lower nature was invigorated by gymnastic and warlike exercises, so that he realised in a high degree the Greek ideal of perfect manhood in the symmetrical development of his bodily and mental powers. Nor did age obliterate his youthful impressions. He retained the strong religious sentiments and profound conviction of a divine mediation in the government of the world throughout life, and turned to account in his own practical way the splendid teaching of Socrates, although he had no capacity for pure philosophical speculations. They have a direct or indirect relation to some particular period of his life, in their outward circumstances, their political and civil bearings, and their spiritual tendency. They may be conveniently distributed into four groups: (1) Historical—the *Hellenics*, *Anabasis*, and *Encomium of Agesilaus*. (2) Technical and didactic—on *Horsemanship*, the *Hipparchicus* or 'Guide for a cavalry commander,' and the *Cynegeticus* or 'Guide to Hunting.' (3) Politico-philosophical—*The Lacedaemonian Polity*, *The Cyropaedeia*, *Athenian Finance*. (4) Ethico-philosophical—*Memorials of Socrates*, *Symposion*, *Oeconomicus*, *Hieron*, *Apology of Socrates*. The *Polity of Athens* is now commonly regarded as an anonymous work written about 415 B.C., which was incorporated in the collection of Xenophon's works only because of its analogy to the *Polity of Lacedaemon*. The style and language of Xenophon is unaffected, simple, and clear, without any attempt at ornamentation; it is well described by Dionysius, the greatest of ancient Greek critics, in his *Letter to Pompeius*, as 'sufficiently pure and clear; in the choice of expressions he prefers those which were ordinary and suitable to the actions, and he arranges them in a pleasant and agreeable manner'—and this judgment is confirmed by Quintilian, the greatest of Latin critics. The dialect he uses is the Attic, but not the purest; his long absence from Athens and intercourse with Ionians and Lacedaemonians familiarised him with many foreign words which he does not hesitate to employ if they serve his purpose.

The *Hellenica* comprise the history of Greece during a period of forty-nine years, in three parts, of which Book i. and part of Book ii., in continuation of the work of Thucydides, centred on the affairs of Athens from 411 B.C. to the reconciliation of parties after the expulsion of the Thirty (403). It presents distinguishing features, which go to prove that it was compiled at an earlier period than the ensuing five books, contemporaneously with the events, and under different impressions, before the author's undue Laconism prevailed over his Attic patriotism. The second part, comprising Books iii.–v., is almost exclusively taken up with the history of Sparta from her war with the satraps of Asia Minor (399) to the peace of Antalcidas (387). The third part comprises the general history of Greece to the battle of Mantinea (362). The historian is silent on domestic topics between 403 and 399—the years in which the events recorded in the *Anabasis* took place. We learn from an allusion in the text (VI. iv. 37) to the death of Alexander of Pherae that the work was not embodied in its present form before 357. The unaffected ease and simplicity of Xenophon's language, his vivid sketches of tragic and striking scenes, and the lively and appropriate speeches which he has introduced in his narrative will always secure him admirers, but they do not entitle him to a place among great historians. He has no such reflections on the causes and consequences of events as are found in Thucydides, nor any of those profound views which tell of the power of generalisation in the author. There is, moreover, a disproportion between the importance of events and the space they occupy in his narrative. Thus the peace of Antalcidas—an event which changed the essential relations of the Hellenic confederacy—is recorded with excessive brevity. Decisive battles, as those of Leuctra, Arginusae, and Aegospotami, are dismissed with a brief notice, while the greatest men of the age, Epaminondas, Pelopidas, and Conon, are thrown in the background. To a certain extent this may be accounted for by the circumstances of the age in which Xenophon lived, when the individual was entirely merged in the state, and it was not yet the fashion, as it became in a later period, to connect great events and achievements with the names of the actors in them. When, therefore, Xenophon speaks of the Thebans generally, it does not follow, as a matter of course, that he wishes to belittle Epaminondas. His credit as a historian has been impugned for allowing his judgment to be warped by his political likes and dislikes; but the charge of garbling or suppressing, distorting, or colouring details according to his sympathies and of a general want of veracity cannot be sustained, as has been recently shown by A. Holm in his *Griechische Geschichte* (1891).

The *Anabasis*, from a strictly historical point of view, is inferior in real value to the *Hellenica*, the event from which it takes its title, 'a going up country,' being merely an incident in the history of Persia, and of no political importance. But it is, upon the whole, the best composed, as it is the most popular, of Xenophon's writings. It is essentially an autobiography of the most eventful part of his life, and combines much of the charm of a historical romance and many elements of ethic interest with its character of authentic history. The first of the two integral parts into which the work resolves itself contains the expedition and death of Cyrus, which occupy but six months of time and less than a sixth part of the text; the second, the *Katabasis* or adventures of the Greek mercenaries on their return after the battle of Cunaxa, which extend over eighteen months and form the principal source of attraction. In the former part Cyrus is the principal actor, in the latter Xenophon himself. The whole may be regarded as filling up the gap between the second and third books of the *Hellenica*, the latter of which begins with a statement which has supplied matter for much speculation among commentators—that 'the story how Cyrus collected an army, with which he marched up the country against his brother, and how the battle was fought and how he was killed, and how after this the Greeks effected their retreat to the sea, has been related by Themistogenes of Syracuse.' It is impossible to say what motive Xenophon had for passing off his own work as the production of another. It can hardly be that, not having yet composed his own *Anabasis* at the time when he published this portion of his *Hellenica*, he could only quote an entirely different work, for it is not likely that there was already published and in circulation a second narrative besides that of Sophaenetus, known to us by quotations in the geographical lexicon of Stephanus of Byzantium (472 A.D.). Plutarch, the only extant ancient writer who refers to this mention of Themistogenes, says that Xenophon's object was to secure greater credit to the record of his own exploits than might have attached to it were it known to have been composed by himself. It is remarkable that neither Diodorus Siculus, whose account of the *Anabasis* is the longest next after Xenophon's, nor Plutarch, in his occasional quotations of Xenophon—both of them honest though uncritical writers—awards him even a moderate amount of the credit which he claims for himself as its foremost hero. The *Anabasis* was not published until after the battle of Leuctra (371), as appears from the references in the fifth book to the author's past life at Scillus.

The *Agesilaus* is a separate memoir in praise of the Spartan king, the author's idol, reproducing the notices of him from the *Hellenica*, with added observations on his expedition to Egypt and death (360). The three technical treatises on *The Art of Horsemanship*, *Cavalry Service*, and *The Chase* are on subjects with which the author had a thorough practical acquaintance. The first is written in a graceful and lively strain, and, so far as it goes, with great accuracy and completeness. The *Hipparchicus* is a less valuable manual of the duties of a cavalry general. The third tract enters with the zest of an enthusiastic sportsman into minute details of harriers and hounds, their breed, points, and method of training, their collars, couples, slips, of the snarer and his apparatus, of the natural history of the hare.

In the *Lacedaemonian Polity* Xenophon has illustrated what he regarded as the best form of a mixed government. M. H. Bazin, in his study on the work (Paris, 1885), thinks that it is an *écrit de circonstance*, written 394 B.C., with a political object, at a time when Sparta

was divided between two parties, the innovators, at whose head had been Lysander and whose views were set forth in a pamphlet by Cleon of Halicarnassus, and the conservative party, led by Agesilaus, who were bent on restoring the real or fancied political virtue of bygone days. This latter tendency Xenophon set himself to help by writing a reply to Cleon. It dwells on those points which the known or supposed plans of Lysander threatened most, as the powers of the kings. It recommends the old-fashioned Spartan virtues by discreetly supposing that every one already practises them. It appeals indirectly to the military spirit of the Spartiate by ignoring the Perioeci and the Helot soldiers, and by mentioning mercenaries with contempt—an attitude which on any other theory is incomprehensible.

The *Cyropædeia*, or 'The education of Cyrus,' which is not properly a history, but a didactic romance with a historical groundwork, is of great interest, as being the first work of the kind in Greek literature. It was highly prized by ancient critics, and, in the opinion of some modern scholars, ranks highest among Xenophon's works in point of literary merit. Xenophon adopted this form of composition as a vehicle for setting forth his own theory of government and his views of law and society in accordance with the writers of the Socratic school—to exhibit the model of a good and wise governor, and to show how citizens can be formed by such an one to be virtuous and brave. He chose for his exemplar the Persians and Cyrus the Great, the founder of their empire, whose life he divides into three sections, two of which, concerning his education as a boy and his training as a youth at the court of his maternal uncle, Astyages, king of Media, together fill but one book, which has given its name to the whole eight, the influence of the national system of education on his hero's character being the mainspring of his own subsequent greatness as founder and organiser of the empire, and of the ascendency which the Persians under his auspices acquired over other Asiatic races. In its details the biography is pervaded by the Socratic spirit. Though the East supplies the background and colouring of the picture, only a few vestiges of Oriental usages and methods of thought are to be met with, for the writer had very little knowledge of them, and made that little go a long way. His materials were borrowed from Sparta. There is no dramatic plot in the work, but a string of successive situations, each calling forth and displaying the hero's aptitude for the art of command, without which hearty obedience is impossible. The episode of Abradatas and Panthea—our earliest sentimental romance—shows much simple pathos, and the striking address of Cyrus to his sons on the immortality of the soul was made large use of by Cicero. The epilogue, on the decadence of the Persians, being the eighth chapter of the last book, could not have been written before 362 B.C., because mention is made in it of two events which, as we know from other sources, took place in that year.

In the tract entitled *Poroi*, or 'Means,' *c.* 356, Xenophon suggests certain reforms in the financial system of Athens, and development of her internal resources, so as to secure a regular state support for all citizens, rich and poor, without being dependent on the tribute of the allies. He recommends that more foreign settlers should be attracted to the city, and a capitation tax imposed on them, and that more should be made of the silver-mines of Laurium; and lastly, that Athens should exert her influence in the settlement of disputes by diplomacy rather than by war.

The *Memorials of Socrates* have brought the author the reputation of being a philosopher; but they are really nothing more than sketches and dialogues without unity or coherence, illustrative of the life and character of his great master—a vindication of him by narrative rather than by argument, originally suggested by the publication of a declamation of the sophist Polycrates (392) in the form of an impeachment before his judges. Xenophon confines himself in this writing to the moral and practical side of his master's teaching, without venturing to enter into his metaphysical speculations, and so, as has been remarked, 'gives us less than the real Socrates, while Plato gives more.' The short allegory known as 'The Choice of Hercules at the Cross-road'—an abridgment of the famous apologue or *epideixis* of Prodicus—and the discourse on the evidence of a deity as displayed in the phenomena of the universe, are specially worthy of admiration. A less elaborate picture of Socrates is drawn in the *Symposion*, which belongs to the same group of works. The scene is laid at an entertainment given by the wealthy Callias in honour of a victory at Athens won by a youthful pancratiast. The table-talk of Socrates and the other guests, which turns on a variety of topics, and winds up with a philosophical disquisition by the former on the superiority of spiritual love over its sensual counterfeit, is diversified by the trifling of a professional jester, and the acrobatic and other feats of a boy and dancing girl brought by a strolling player from Syracuse. Xenophon's inferiority, as a thinker, to Plato is obvious in this dialogue, the vapid prose and the trivial commonplace of which are in marked contrast with the genial and high-flown speculations of Plato in his *Symposion*.

The *Oeconomicus* is the only Socratic dialogue that can bear comparison with those of Plato. It was intended to embody Socrates' ideas on the branch of economy which considers the relations of a family as distinct from those of a state. It begins with a conversation between Socrates and his favourite pupil, Critobulus, at which Xenophon was present, and slides off into a secondary dialogue, which is in fact only a recapitulation of another conversation once held between Socrates and Ischomachus, a wealthy Athenian proprietor, on the subject of family management, the former as the learner, the latter as instructor. The book presents an interesting picture of a Greek household, deals with the education of women, and the respective duties of husband and wife, and includes a graphic and characteristic account of the ordinary occupations of a country gentleman. In the management of labourers leniency is enjoined as preferable to harshness, and the need of active personal supervision is strongly insisted on.

The *Hieron*—one of the most pleasing of Xenophon's didactic compositions—is in the form of a dialogue between Simonides the famous lyric poet and Hieron, despot of Syracuse. Simonides advocates the popular view that a tyrant is, or ought to be, the happiest of men, and in spite of Hieron's arguments on the other side of the question that his lot is the most unenviable, maintains that it is quite possible for an enlightened tyrant, by a judicious and philanthropic exercise of his power, to be both a powerful and a popular ruler.

The *Apology of Socrates* is a short tract vindicating the attitude of Socrates during his trial and after the verdict, by showing that he really preferred death to life, and that it was his consciousness of his own innocence that prevented him from naming any punishment as due to the offence of which he was convicted.

The earliest printed edition of any of Xenophon's works is the Latin version of the *Cyropaedeia* by F. Philelfus (Rome, 1473). The *editio princeps* of the Greek text was that of Boninus, printed by P. Giunta (Florence, 1516), reprinted in 1527, followed by the Aldine in 1525. In the long list of subsequent editions of the whole or part of his works the most important names are those of Zeune, T. Hutchinson, Weiske, J. F. Fischer, J. G. Schneider, F. A. Bornemann, L. Breitenbach, K. W. Krüger, R. Kühner, G. A. Sauppe, L. Dindorf, K. Schenkl, F. K. Hertlein, Cobet, O. Keller (*Hellenica*), Zurborg, Arnold Hug (*Anabasis* and *Cyropaedeia*). There are editions with notes in English of the *Cyropaedeia*, *Hieron*, and *Oeconomicus* by the present writer, of the *Anabasis* by A. Pretor, and of the *Memorabilia* by J. Marshall. There are several lexicons, to the whole works by F. G. Sturz, to portions by G. A. Koch, K. W. Krüger, H. L. Strack, C. Thiemann, and F. Volbrecht. The work of Ad. Roquette, *De Xenophontis vita* (1884), and that of A. Croiset, *Xénophon, son Caractère et son Talent* (1873), are valuable. There is a translation by H. G. Dakyns (4 vols. 1890–99).

Xeres, or (1) JEREZ DE LA FRONTERA, an important town of Spain, 14 (by rail 30) miles NE. of Cadiz, with a Moorish castle (*Alcazar*), a collegiate church, a handsome municipal building, and many large *bodegas* or wine-stores. It is the centre of the trade in Sherry (q.v.). The *Asta Regia* of the Romans, it owes its modern name to the Moors, who near by fought a seven days' battle and defeated Roderic, the last of the Goths, in 711. Pop. (1887) 61,708.—(2) XEREZ DE LOS CABALLEROS, 40 miles S. of Badajoz, is a picturesque old town, once a seat of the Templars (hence the name); parts of the castle remain, and much of the old Moorish wall. Pop. 8953.

Xerxes I., king of Persia in 485–465 B.C., was the son of Darius and Atossa, and succeeded when Darius died in the midst of his preparations for a third expedition against Greece. He first subdued the rebellious Egyptians, then started with an army consisting of immense hordes of men from all parts of the vast Persian empire, and an enormous fleet furnished by the Phœnicians. He crossed the Hellespont by a bridge of boats, an English mile in length, and when the bridge was destroyed by a storm is said to have ordered 300 lashes to be given to the rebellious sea. Another bridge, consisting of a double line of boats, was built, and a canal cut through Mount Athos. The preparations were completed in 481 B.C., and in the autumn of that year Xerxes arrived at Sardis, where he wintered. Next year the vast assemblage began to march towards the Hellespont; it took, says Herodotus, seven days and nights to pass the bridge. After crossing the Hellespont the march was continued along the Thracian coast towards the plain of Doriscus on the Hebrus, where the army was numbered. Herodotus puts the whole number of fighting-men at 2,641,610; the ships of war at 1207, besides 3000 smaller vessels. This immense force moved on without resistance till it reached Thermopylæ (q.v.), where it was brought to a stand by Leonidas and his 300 Spartans. After these were all slain Xerxes marched onwards through Phocis and Bœotia, and on arriving at Athens in the summer of 480, three months after crossing the Hellespont, he found it deserted, and destroyed alike temples and houses. Meantime the two fleets had sailed round from Eubœa in the narrow strait between Salamis and the Attic coast, where took place the famous naval battle of Salamis (q.v.). Xerxes witnessed the fight from a lofty throne which he had erected. Confounded at the result of all his mighty preparations, he fled with all haste towards the Hellespont. Mardonius was left with 300,000 men to carry on operations in Greece, and his hopes of conquest died with him on the fatal field of Platæa (479 B.C.). Xerxes was murdered by Artabanus in 465, and was succeeded by his son Artaxerxes.

Xesibeland, between Griqualand East and Pondoland, was annexed to Cape Colony in 1886.

Xime'nes de Cisneros, Francisco, cardinal-statesman, was born of an ancient but impoverished family at Torrelaguna, in Castile, in 1436. He was educated at Alcalá de Henares, Salamanca, and finally Rome, where he obtained from the pope a provisional or prospective nomination to the archpriestship of Uzeda in Toledo. The archbishop refused to admit him, and flung him into prison, where he lay for six years. On his release he was named Vicar-general of Cardinal Mendoza at Siguenza; but he suddenly threw up this preferment and the most brilliant worldly prospects to enter the Franciscan monastery of San Juan de los Reyes at Toledo (1482). His reputation for piety and learning led Queen Isabella to choose him for her confessor in 1492, and three years later to name him Archbishop of Toledo—a dignity which he refused to accept until he received an express command from the pope. Compelled to yield, he continued as archbishop the life of mortification and austerity of the monk, applying to purposes of religion and charity the whole of the princely revenues of his see; and even when admonished by the pope to maintain the dignity of his position, he hid the hair shirt of the ascetic under the gorgeous robe. As confessor and confidential adviser of the queen, Ximenes during the lifetime of Isabella was the guiding spirit of Spanish affairs; and on her death in 1504 he held the balance between the parties of Ferdinand and Philip of Burgundy, husband of Joanna, the heiress to the crown. On the death of Philip in 1506 Ximenes was appointed regent in consequence of the insanity of Joanna and the absence of Ferdinand, and he conducted the affairs of the kingdom through a critical time with consummate skill. In 1507 he was created cardinal, and next year he organised at his own expense, and himself accompanied as commander, the celebrated expedition for the conquest of Oran and extirpation of piracy, consisting of 10,000 foot and 4000 horse. Ferdinand died in January 1516, and on his deathbed named Ximenes regent of Spain till the arrival of his grandson Charles; and although the grandees had organised an opposition as well to himself as to the royal authority, the aged cardinal quickly overawed them into submission, and with the same vigour quelled the incipient revolt of Navarre. In September 1517 Charles at length landed on the soil of Spain, and Ximenes at once set out to meet him, but was seized with a mortal illness on the way, and died at Roa, November 8, 1517, probably before receiving the cold letter of Charles, which was equivalent to dismissal.

As a statesman and administrator Cardinal Ximenes showed inflexible determination and courage, but it is scarcely doubtful that his measures did a fatal injury to Spain, by building up to an excessive height the power of the crown, and by mercilessly crushing the conquered Moors. He was fanatical in his hatred of heresy, and as Grand-inquisitor is supposed to have caused the death of as many as 2500 persons. The social and political revolution he effected in breaking down the feudal power of the nobles has often been compared with the analogous change wrought in France by Richelieu. His munificence as a patron of religion, of letters, and of art has been the theme of praise in every history of his time. He founded and endowed the university of Alcalá de Henares, and published the famous Complutensian Polyglot—a magnificent undertaking, on which he expended half a million ducats (see Vol. VIII. p. 298). His expenditure on churches, hospitals, schools, convents, and other works of religion and benevolence, was on a scale of corresponding munificence.

The chief authority for his Life is the work by Alvaro Gomez de Castro, *De rebus gestis Francisci Ximenii* (1659). Other Lives are by Hefele (Tüb. 1844; 2d ed. 1851; Eng. trans. 1860) and Ulrich (1883).

Xylography, See Wood-engraving.

Xyloidine, an explosive like gun-cotton, prepared by the action of strong nitric acid on starch or woody fibre.

X. Y. Z. Correspondence, in U.S. history, is the name given to the despatches of the three commissioners to France, Marshall, Pinckney, and Gerry (see Vol. VII. p. 63), containing the insulting demands made by Talleyrand and the other Directors as the price of respect and courtesy to the American republic. In the otherwise complete copies published by congress President Adams substituted X. Y. and Z. for the names of Talleyrand's emissaries.

Y

the twenty-fifth letter of our alphabet, is derived from the Greek letter *upsilon* (see U), which had two forms, V and Y; the first was taken over to Italy with the original value (our *u* in 'rude'), which it still retains in Italian. In the classical age the Greek *upsilon* had acquired a thinner sound, nearly that of the French *u*, or the German *ü* in *über*, the digraph *ou* being employed by the Greeks to represent the older sound, which had been preserved in Latin. In the time of Cicero the symbol Y was borrowed by the Romans from Greece in order to transliterate the *upsilon* in Greek loan-words, the Greek *ou* and *ŏ* being transliterated by U, as in the word *Lycurgus*. That Y was introduced into Italy before Z is shown by the relative position of the two letters in the alphabet. Our English use of *y* is unique. Save in a few exceptional cases where it is used, as in Latin, to transliterate Greek words, such as 'hyperbola,' 'hydrostatics,' 'tyrant,' or 'hypocrite,' it is not descended from *upsilon*, but from the Greek *gamma; g* in Middle English assuming a form which became so nearly identical with that of *y* that ultimately it replaced it, just as the resemblance of *y* to the rune *thorn* has led to our writing *ye* instead of *the* (see ALPHABET). The history of this change is curious. With the other Latin letters *y* was introduced into the Anglo-Saxon alphabet, retaining its Latin value, an *i* pronounced with the lips somewhat rounded; a sound which has passed into *i* or the neutral vowel, as in the words 'birth,' 'wright,' 'hill,' 'king,' 'evil,' 'her,' or 'worm,' which were originally spelt with *y*. Hence as a matter of fact the Anglo-Saxon *y* has left no lineal descendant in any modern English word. Meanwhile another letter resembling the form of *y*, but representing a different sound, was being evolved out of the Anglo-Saxon *g*, which weakened before or after front vowels; and having thus acquired two values, its Anglo-Saxon form ȝ was conveniently used to denote the weak sound, the Caroline form, g, being reserved for the stopped *g*. In Middle English this decayed sound was represented by ȝ, and in the 15th century the written forms of ȝ and *y* approximated so closely as to be almost indistinguishable. Hence, early in the 16th century, after the introduction of printing, the form *y* came to be generally used instead of ȝ, the Anglo-Saxon vocalic *y* being ultimately replaced by *i*, or some other vowel. Thus we obtain the double value of *y* in modern English. In such words as 'ye,' 'yes,' 'yea,' 'yet,' 'year,' which represent the Anglo-Saxon *ge*, *gese*, *gea*, *git*, *gear*, the sign *y* is not really a *y*, but stands for the Middle English ȝ, which is the Anglo-Saxon form of *g*. A *y* appears before back vowels in 'young' and 'yard' owing to the loss of the front vowel in the Anglo-Saxon *geong* and *geard*. It has also been introduced by analogy into the words 'you' and 'yew,' from the Anglo-Saxon *eów* and *eow*, but not into the homophone 'ewe,' from the Anglo-Saxon *eówu*. In some modern loan-words, such as 'yacht,' 'yawl,' and 'Yakut,' it has been introduced to transliterate the continental *j*. The final *y*, so common in English, also represents an Anglo-Saxon *g*, as in the words 'lady,' 'army,' 'many,' 'busy,' 'empty,' 'body,' 'day,' 'key,' 'may,' 'say,' 'gray,' 'eye.' By analogy it has crept into words of a different origin, such as 'jolly' (Old Fr. *jolif*), 'tardy' (Fr. *tardif*), 'crockery,' 'jetty,' 'nunnery,' and 'mummy.' In 'by' and 'my,' and perhaps in 'sky,' it has been introduced from analogy with such words as 'dry,' 'fly,' and 'shy,' where the *y* is really the Middle English ȝ. In the 14th century a fashion set in of substituting the vocalic *y* for *i*. This fashion disappeared in the 16th century, leaving a trace in the *y* of *rhyme*, a misspelling for rime, which has been retained owing to the erroneous notion that it was a loan-word from the Greek *rythmos*, and not the Anglo-Saxon *rím*. Also by analogy *y* represents the final vowel in such Greek loan-words as 'academy' or 'irony.' Our peculiar consonantal sound of *y*, due as we have seen to the weakening of the Anglo-Saxon *g*, is unknown on the Continent, where its place has been taken by the evolution of a consonantal *j*, as in *jule* and *jahr*, our 'yule' and 'year.' Our own consonantal *j* is due to French influence, as in the words 'journey,' 'jest,' 'jewel,' 'Jane.' Italian has discarded *y*, replacing it by *i*. In other continental languages, with a few exceptions (such as the French pronominal *y*, derived from Latin *ibi*), it is normally used, as in Latin, for transliterating *upsilon* in Greek loan-words.

Y, THE. See AMSTERDAM.

Yablonovoi, or YABLONOI, a ridge of mountains in the north-east of Asia, dividing the basin of the Amur from that of the Lena. Some peaks are 7000 feet high, but parts of the ridge are a kind of plateau. See SIBERIA, ASIA (p. 486).

Yacht, a small sailing or steam vessel, decked (as distinguished from an open boat), and permanently fitted out and exclusively used for pleasure. Vessels answering the character of yachts were in use by royal personages in England from a very early period, but the name was first applied in 1660 when the Dutch presented a 'jacht,' named the *Mary*, to Charles II. Queen Elizabeth in 1588 had a royal yacht built at Cowes, Isle of Wight, and every succeeding English sovereign has had one or more yachts. In 1662 Charles II., who had a number of yachts designed and built for him by Sir Phineas Pett, is recorded to have matched for £100 a yacht of his own design against another, of Dutch build, under his brother the Duke of York.

Copyright 1892 in U.S. by J. B. Lippincott Company.

The first authentic record of a sailing club is in 1720, when the 'Cork Harbour Water Club'—now known as the 'Royal Cork Yacht Club'—was established. The vessels owned were small, and from that period till early in the 19th century yachting developed but slowly. In 1812, when there were probably about fifty yachts afloat, an association similar to the Cork club was established at Cowes by some fifty-five yachtsmen. Known first as 'The Yacht Club,' it continued steadily to

increase in membership and importance until 1820, when, having attracted the attention of William IV., then Duke of Clarence, its name was altered to 'The Royal Yacht Club,' and subsequently to 'The Royal Yacht Squadron,' the title by which it has since been known. Since 1820, and more particularly during the last half of the century, yachting associations have rapidly grown in numbers, strength, and popularity. There are now over forty 'royal' or 'recognised' yacht clubs distributed around the coasts of the British Isles, four-fifths of which have been founded since 1840. Most of the clubs are English, and are located chiefly on the Thames and the channel between Southampton and Isle of Wight. Some eight are Irish and ten Scottish; the most important of the latter being the Royal Northern, founded in 1824, having its headquarters at Rothesay, and the Royal Clyde (1856), at Hunter's Quay. The clubs which stand first as to number of members and yachts is the Royal Thames (1823), and the Royal London (1838). In foreign countries and in British possessions during recent years yachting has been growing in popularity. France, Germany, Austria, Holland, Belgium, Russia, Australia, and Canada have each yachting associations. In America yachting dates from only about 1844, in which year the New York Yacht Club was founded. In the first five years of its existence this was the only yacht club in the United States, and so late as 1870 only some fifteen clubs altogether were in existence. The history of this club in fact is practically the history of American yachting, for down to the year 1885 no other club—although the number had greatly increased—ever attempted anything more than mere local efforts. In the matter of organised squadron-cruising, ocean-racing, or private matches the New York Club has all along taken the lead, but during recent years Boston has in this connection shared the honours with New York.

From the year 1850, when there were only about 500 British yachts afloat, the increase in numbers has been immense, and the increase in size of individual vessels no less remarkable. The total number and tonnage of yachts owned in the United Kingdom in 1891, as recorded in Lloyd's Yacht Register, were sailing-yachts, 2428 of 59,795 tons; steam-yachts, 788 of 78,090 tons; or a grand total of 3216 vessels of 137,885 tons. The British colonies own 253 yachts, principally sailing, having a tonnage of 7193 tons. France owns a total of 476 yachts of 16,378 tons, of which 180 of 10,020 tons are steam-vessels. Germany and Austria own together 327 vessels of 5895 tons, of which 24, of 2825 tons, are steam-vessels. The grand total of the number of yachts belonging to all nations as recorded in the register is 6179 vessels, 1164 of which belong to America.

The materials used in the build of yachts are wood, iron, and steel; wood alone, wood and iron together (composite), iron alone, and steel alone being the several ways in which the materials are employed. Wooden yachts have their bottoms coppered to protect the planking and secure the smoothness of surface essential to speed. Lead, the use of which for ballast began in 1846, has since 1874 been adopted entirely for the purpose, in the form of lead keels forming an integral part of the hull. While speed, generally speaking, has always been the regulating condition of design, the other considerations determining the proportions, scantling, and build of yachts have fluctuated greatly throughout the course of their evolution, from the unpretentious rig and clumsy build of the small craft of the 18th century to the immense spread of sail and the rakish narrow model of the lengthier yachts of the present time. Prior to the advent in British waters in 1851 of the famous *America* (170 tons) of the New York Yacht Club the Cutter (q.v.), or 'national rig,' was much the most favoured by the British yachtsmen, especially for racing purposes. After the brilliant performances of that vessel, however, in winning, against fourteen rivals, the cup presented by the Royal Yacht Squadron for a race round the Isle of Wight, the attention of designers was forcibly drawn to the merits of the Schooner (q.v.) rig. The flat set of her sails was especially novel (in England it had been the practice till then to have them 'baggy'), and it is not too much to say that the lesson she taught the yacht sailors in the art of setting canvas has never been forgotten. The *America*, in fact, was a revelation, not only as regards rig, but in matters connected with the form and proportions of hull. Up to 1848 development had proceeded on conventional lines, but in that year a yacht of an entirely different type was built on the Thames. This was the iron cutter *Mosquito*, of 50 tons, the features chiefly distinguishing her being a long hollow bow and a short after-body of considerable fullness—a reversal, in fact, of 'the cod's head and mackerel tail' order of design then being disparaged by Mr Scott Russell, who advocated in its place his 'wave-line theory.' This marked deviation from orthodox lines, however, did not meet with ready acceptance, and prejudice was still strong when the success of the *America* forcibly shook English yachtsmen out of their complacency. Her model partook of the very features then being advocated, and copies of her and of the schooner style of rig became quite the rage in new yachts, both for racing and cruising purposes; even existing cutters being lengthened in the bows to give them the hollow contour in vogue. This movement notwithstanding, the cutter style of rig has held its own, the number of such craft being always on the increase. Since 1864, when the yawl (see SAIL) rig assumed importance, and especially during the past few years, the cutter has again decidedly become the favourite rig, not only for racing purposes, but—above 40 tons—for cruising as well. The labour and expense connected with racing a schooner are so very much greater than with a cutter or yawl, that there is but small likelihood of the former again coming into favour.

American yacht designers have in turn benefited from British example. In 1881 the 10-ton cutter *Madge*, designed by G. L. Watson of Glasgow, was sent across the Atlantic, and it is not too much to say that her performances in American waters established the cutter model in that country on a firm foundation, modifying the American centre-board model, and resulting in a yacht with the depth, the outside ballast, and in part the rig of the cutter, retaining still the advantage of beam and centre-board. Centre-board yachts are of restricted depth, displacement, and draught, and have the effective area for lateral resistance to avoid leeway made up by a 'shifting keel' or 'centre-board,' fitted to drop below and in line with the keel proper. When made of heavy material, centre-boards also serve to impart stability to a vessel while under press of canvas. They are, as a rule, pivoted at the fore-end, and drop, like a fin, towards the aft extremity, and are either rigid and housed in a well inside the vessel, or made collapsible, like a fan, and carried alongside the keel. The idea of their use is traced to the old Dutch lee-boards—boards attached one to either side of flat-bottomed boats, one or other being let down as may be needed to check drifting. The exigencies of American yachting waters, if they did not suggest, have at least favoured the development of this class of yacht from the beginning of yachting there. It is, however, only since the interest in American yachts which the visit of the *America* and

subsequent international contests engendered, that British designers have studied the centre-board and one or two notable centre-board yachts have been tried.

The necessity for time allowances in races where yachts of different sizes and spread of sail are matched together, and the efforts at classifying and differentiating them according to a given rule for measurement of Tonnage (q.v.), largely account for fluctuation in design. System and uniformity in these matters have been, on the whole, well attained since 1875, when the Yacht Racing Association was established with the object mainly of providing one code of sailing rules in all matches, and of deciding such disputes as might be referred to the council. This association in fact bears much the same relation to yachting that the Jockey Club does to horseracing. It adopted the rule for ascertaining the size or tonnage of yachts which had been in use for a very considerable period, known as the 'Thames Rule,' because first employed there. It was based upon and a modification of the well-known 'Builder's Old Measurement' rule, in which the length and breadth only were factors. In operation this rule was found to favour length and depth at the expense of breadth. The absence of restriction on depth and the penalty put upon beam engendered a deep narrow type of vessel, which, although admirable for sea-going qualities, caused difficulties in competitive sailing. Thus vessels of extreme length, depth, and narrowness, which were kept up by enormous masses of lead on the outside of the keel, were enabled to compete on equal terms with vessels of greater proportionate width, less depth, and less spread of sail. Such anomalies led to minor modifications on the rule, and finally in 1885 to its entire relinquishment in favour of a rule of measurement or 'rating' which takes account only of length on water-line and area of sail carried. This has left naval architects a freer hand in the matter of adopting either a long and narrow or a short and 'beamy' boat, with appropriate ballasting. In this way a set of yachts have been created which besides being splendid as racing craft are also admirable sea-boats, and well adapted for cruising when their butterfly life as racing clippers is ended. Notwithstanding this, the rating rule which has been in use since 1885 has been subject to criticism from owners and designers of the smaller classes of yachts, on which the rule has operated hardly. It has been pointed out, for instance, that the tax on sail area should be abolished, because in heavy weather a lengthy boat with diminished canvas can run away from a rival—a 'poor man's boat' probably—who has sacrificed length to a spread of canvas only possible in light breezes.

International yacht-racing—or contests between yachts built and owned in different countries—is the highest and most generally interesting form which the sport can assume. It may be said to date from 1851, the year of the Great Exhibition, when, as before related, the famous schooner *America* bore away the trophy presented by the Royal Yacht Squadron at Cowes. Commodore Stevens, the owner of the *America*, died in 1856, and by a deed of gift set the cup apart as 'a perpetual challenge for friendly rivalry between foreign countries.' This trophy has come to be regarded as the emblem of the supremacy of the seas—in a yachting sense—its possession having been frequently contested. In 1870 the *Cambria*, owned by Mr James Ashbury, made an unsuccessful attempt to bring back the cup to England, as did the same owner's *Livonia* in the following year; the latter vessel being built expressly for the task, and the whole effort involving an outlay of £22,000. The Canadian schooner *Countess of Dufferin* in 1876, the *Atalanta* in 1881, the *Genesta* in 1885, and the *Galatea* in 1886 each made futile efforts to defeat the American representatives, as also in 1887 did the *Thistle*, a steel cutter built on the Clyde expressly for the purpose from the designs of G. L. Watson, for a syndicate of Scottish yachtsmen, headed by Mr James Bell of Glasgow. Prior to this vessel's departure for America she proved her superiority over all English yachts. Meanwhile the Americans had, from the designs of Edward Burgess, built the centre-board sloop *Volunteer*, which in September twice defeated the Scotch cutter. In 1893–94–95 Lord Dunraven thrice attempted to secure the America Cup with his (built specially for the purpose) *Valkyrie I.*, *II.*, and *III.*, the last contest leading to long and acrimonious debates. Of three trials the *Defender* won the first (the sailings being very much impeded by steamers crowded by sightseers), the second ended in a foul, and before the third Lord Dunraven withdrew his yacht. Sir T. Lipton's challenge in 1891 was accepted by the New York Club, and in October 1899 the *Shamrock* (built in Ireland) raced the American *Columbia* outside Sandy Hook—the latter winning three consecutive races. The *Ircx* (80 tons) during the 1887 season won seventeen first prizes and six second (thirty-four starts), winning £1789. The *Genesta* (80 tons), which won the £1000 prize in the Jubilee race round the British Isles, secured twelve other prizes and £1355. In 1898 the Duke of Abruzzi's yacht *Bona* won in the regattas on the French Riviera thirteen prizes, the gross value of which was £2800; in British waters this famous cutter started thirty-six times, and won £1655 in twenty-seven different prizes. Against such figures, however, must be set the expenses of racing, which are very great, amounting in the case of an 80 or 100 ton cutter to fully £2000 or £3000 a year. The expenses of cruising yachts are, of course, not so heavy; the crew is neither so numerous nor so highly paid, the breakage of spars and tearing of sails is not so frequent, and there are no entrance fees nor 'winning money' to pay over.

While the growth, since 1850, of the world's pleasure-fleet of sailing-yachts has been remarkable, the increase of steam-yachts has been still more wonderful, in spite of the antipathy with which they were long regarded by racing yachtsmen. In 1850 there were not more than four or five steam-yachts—properly so called—afloat. Lloyd's Register of late years shows a total afloat of about 150 steam-yachts above 300 tons—55 being over 500 tons and a dozen over 1000 tons. The rapidity with which they have grown into favour for cruising is easy of explanation. Yachts mechanically propelled are independent of wind, and can traverse the sea to any desired point when the sailing craft is lying helplessly becalmed. Large steam-yachts can keep the sea practically all the year round and go enormous distances. The largest of the modern steam-yachts are 'auxiliary' in character—i.e. fitted with steam-engine and screw-propeller in addition to the ordinary spread of sails. Their prime cost and the cost of upkeep and management are, however, enormous, and their possession is beyond all but the wealthiest owners.

Yachting has been encouraged by government, as affording an excellent training for seamen who in time of war become available for the royal navy. The first Royal Cup was presented in 1834 by William IV. to the Royal Yacht Squadron, a gift which has been continued ever since, and in recent years supplemented by similar gifts to other clubs. Warrants are granted by the Admiralty to members of clubs to fly the white, blue, or red ensign, with device upon it, when the yachts are registered according to the provisions of the Merchant

Shipping Acts. These warrants carry with them certain privileges, such as exemption from excise duties and harbour and anchorage dues. The master or mate need not have Board of Trade certificates, and the yacht's name need not appear on her stern—although in both these cases the privilege is of doubtful utility.

See Dixon Kemp, *Yacht Architecture* (2d ed. 1891); *Manual of Yacht and Boat Sailing* (7th ed. 1891); E. Burgess, *English and American Yachts* (1888); C. P. Kunhardt, *Small Yachts* (1885), and *Steam Yachts and Launches* (1888); and the annual *Lloyd's Yacht Register* and *Yacht Racing Calendar;* also the articles BOAT, SHIPBUILDING.

Yak (*Bos grunniens*), a species of ox found in Tibet, and domesticated there. The wild yak of central Asia is the largest native animal of Tibet, and is found only near the limits of perpetual snow, descending into the higher wooded valleys in winter, and ascending in summer to the pastures of short grass, some of which are at an elevation of 17,000 feet above the sea. It is very fierce, falling upon an adversary not only with its horns but with its chest, and crushing him by its weight. The domesticated yak, which forms great part of the wealth of the inhabitants of the highest and coldest regions of central Asia, is about the height of an English ox, which it much resembles also in body, head, and legs; but it is covered all over with a thick coat of long silky hair, that of the

Yak (*Bos grunniens*).
(From a Photograph by Gambier Bolton, F.Z.S.)

lower parts of the body being very long and hanging down almost to the ground. The neck is short; the rump is low; the legs are short. Over the shoulders there is a bunch of long hair; and the tail is covered with a prodigious quantity of long flowing hair. Black and white are the most prevalent colours. The great quantity of hair gives the yak an apparent size far beyond the reality. Its characters seem to bridge over the gulf—not a very wide one—between the sheep and oxen. The yak does not low like an ox, but utters a short grunting sound. Its milk is very rich, and yields excellent butter and curd. The yak is never used for tillage or draught, but as a beast of burden travels twenty miles a day. The hair is spun into ropes, and made into coverings for tents; the soft fur on the hump and shoulders is made into a fine and strong cloth.

Yakub Beg, YAKUB KHAN. See KASHGAR, TURKESTAN (EASTERN), AFGHANISTAN.

Yakutsk, chief town of a government in Eastern Siberia, on a branch of the Lena, and about 4 miles from the main stream. It has a cathedral and several churches, and there are a few merchants trading in hides, furs, and mammoth tusks. Pop. 5300. The dreary government of Yakutsk consists of the basin of the Lena River, and has an area equal to four-fifths of European Russia (see RUSSIA). The Yakuts (see SIBERIA) are of Turkish stock.

Yale University, one of the leading institutions of learning in America, situated at New Haven, Connecticut, was founded at Saybrook in 1701 as the collegiate school of the colony, under the trusteeship of the ten principal ministers, and in 1718, when it was removed to New Haven, named after Elihu Yale (1649–1721), a Boston (Mass.) man, who had been governor of Fort St George, Madras, acquired great wealth, and sent the young institution gifts of money and books to the extent of £800. The name Yale College, applied at first only to the new building, was given formally to the institution in its charter of 1745. A chair of Divinity was added in 1755, and another of Mathematics, Physics, and Astronomy in 1771, though this was not permanently filled till 1794. Occasional grants were made by the legislature before the Revolution, and $30,000 was voted by the state in 1792. Schools of medicine (1812), theology (1822), and law (1824) were established; and, as reorganised in 1871, the university possesses also departments of philosophy and arts, the latter including, besides the classical course of 'Yale College' proper, the Sheffield Scientific School (begun 1847, endowed 1869), post-graduate courses, and a school of fine arts (1864). A great part of the studies in the third and fourth years is elective. The students number over 1200, half of them in the college proper; there are over seventy professors and fifty tutors and lecturers. Among the presidents have been Timothy Dwight and his grandson, T. D. Woolsey, and Noah Porter; and the two Sillimans were professors of Chemistry from 1802 to 1885. The library contains some 200,000 volumes; in 1891, 8700 vols. and some 22,000 pamphlets were added. The numerous buildings cover some 9 acres in the heart of the city, the oldest dating from 1752, and others including the School of Fine Arts, where the Trumbull (q.v.) paintings are housed, the Peabody Museum (1866), the observatory, the Sloane Memorial physical laboratory (1884), Lawrence and Dwight halls (1886), and the Kent chemical laboratory.

See books by Clap (1766), Kingsley (1879), Dexter, and Eaton (1883); and *Four American Colleges* (1895).

Yalta, a town (pop. 6000) and health resort on the south coast of the Crimea.

Yalu, another name for the Am-nok river bounding Corea (q.v.). For the battle in 1894 and its results, see CHINA (p. 194).

Yam (*Dioscorea*), a genus of plants, mostly tropical, natives of the West Indies, Polynesia, China, &c. The great fleshy roots of some of them are very much used as food; they contain much starch, and generally become somewhat mealy and pleasant to the taste when boiled. This, however, is not the case with all: the roots of *D. triphylla*, *D. dæmonum*, *D. virosa*, and several other species with ternate leaves are very nauseous, even when boiled, and are poisonous. The tubers of all the yams contain an acrid substance, which, however, is dissipated by boiling, except in the species with compound leaves. The roots of the Winged Yam (*D. alata*) of Polynesia are 1½ to 3 feet long, and often 30 lb. in weight, with a brownish or black skin, juicy and reddish within; they vary exceedingly in form. The stem, which is winged, twines up tall poles. Two or three small tubers are generally found in the axils of the leaves. It is supposed that this species may be the original of most, or perhaps all, of the yams cultivated in the tropical parts of Asia, Africa, and America—as the common yam of the West Indies (*D. sativa*),

which has a round stem and heart-shaped leaves; *D. bulbifera*, in which the tubers in the axils of the leaves attain the size of apples; the Prickly Yam (*D. aculeata*); *D. globosa*, the most esteemed yam of India, which has very fragrant flowers, and roots white internally; *D. rubella*, another Indian kind. Yams are propagated by means of their tubers; the small axillary tubers, or the small tubers produced at the base of the stem around the neck of the large tuber, being used for this purpose. A species of yam (*D. batatas*) brought from the temperate parts of China is found to succeed well in France. It is hardy enough to endure the climate even of Scotland without injury; but the heat of the summer is not sufficiently great, so that, in general, the plant merely lives, without producing a large tuber. The stem requires the support of a pole, round which it twines; the leaves are more elongated and acuminated than those of the West Indian yams; the root strikes perpendicularly down into the ground, and forms its tuber often at a very considerable depth; this may be prevented by putting a slate under it. The true yam is little cultivated in the United States, where the name is often given to the Sweet Potato (q.v.). See also COCCO.

Yam (*Dioscorea sativa*): *a*, a flower; *b*, root.

Yanáon (Yánám), a small patch of Indian soil belonging to France, and under the governor of Pondicherry, forming a small enclave surrounded by British territory (province of Madras), with 3½ sq. m. of area and 4470 inhabitants. It lies near the mouth of the Godavari, between the main stream and its branching mouth, the Coringa.

Yanbu', or YEMBO. See MEDINA.

Yang-tsze-kiang (better simply *Kiang* or *Chiang*), the longest and most important of Chinese rivers, affording a waterway, not unbroken by rocks and rapids, across the breadth of China from Tibet to the sea, rises in the mountains of Tibet, where its sources were explored by Prejevalsky in 1884–85, and after a course of 3200 miles (south-east, north-east, and east) through Yunnan, Sze-chwan, Hu-pei, An-hui, and Chiang-su, reaches the sea by a wide estuary which begins 50 miles below Nanking, and may be held to terminate near Shanghai. On its banks are, besides Nanking, the important towns of Chin-kiang, Ngan-king, Hankow, Wu-chang, Ichang, and Chung-king (opened to European commerce by treaty in 1890). Some of its many tributaries are over 1000 miles long; its basin is estimated at 689,000 sq. m. Its importance for commerce is enormous, though the navigation is in places difficult even for native boats. Steamers are now running. The treaties of 1898–99 recognised the basin of this river as open to English commerce, and (Russia assenting) a special sphere for English enterprise. See CHINA (p. 184); A. J. Little, *Through the Yang-tse Gorges* (1888; 3d ed. 1898).

Yanina. See JANINA.

Yankee, the popular name for a New Englander in America, and in Great Britain often applied indiscriminately to the whole population of the United States, has often been explained as in its origin a corruption of the word English as pronounced by the Indians (Yenghies, Yanghies, Yankees). It was in use in Boston about 1765, but is claimed to have circulated in Cambridge slang as early as 1713, with the sense of 'excellent.' If so, it is the same word we meet in Scotch *yankin*, 'active,' *yank*, 'a sharp stroke.' The Southern population apply the name to Northerners generally. For 'Yankee Doodle,' see NATIONAL HYMNS.

Yankton, capital of a county of that name in South Dakota, and prior to 1883 capital of the territory of Dakota, stands on the north bank of the Missouri, nearly 200 miles above Omaha, and 569 miles by rail W. by N. of Chicago. It contains mills and breweries, railway-shops, and grain-elevators, and has a busy river trade. Pop. 3670.

Yapock (*Chironectes palmatus*), an aquatic marsupial quadruped of the Opossum family, Didelphyidæ, the only known species of its genus. It occurs from Guatemala to southern Brazil. Its food consists of small fishes, crustaceans, and the like. The feet are webbed for adaptation to the aquatic habits. In size the yapock is rather larger than a rat; the general colour is light gray crossed by transverse bars of brown.

Yard (A.S. *gyrd*, *gierd*, 'rod'), the British standard measure of linear dimension (see WEIGHTS AND MEASURES). The yard contains 3 feet, and each foot 12 inches. Yard and Ell (q.v.) are often, but erroneously, treated as identical. The military pace is 2½ feet.

Yarkand, the commercial capital of Eastern Turkestan, on the Yarkand or Zerafshan River, about 100 miles SE. of Kashgar; pop. 60,000. It was visited by Marco Polo, but was hardly known till R. Shaw in 1871 published an account of his residence there three years before. The oasis in which it stands is very fertile, and there is great wealth of minerals in the mountains within view of it. See TURKESTAN and books quoted there.

Yarmouth, a municipal, parliamentary, and county borough, seaport, watering-place, and fishing-town of Norfolk, 20½ miles E. of Norwich and 122 NNE. of London. It stands 2½ miles above the mouth of the river Yare, on a slip of land 1½ mile broad, which is washed on the west by the Yare, expanding here into Breydon Water, and on the east by the German Ocean. A bridge connects the town with its Suffolk suburbs of Southtown, or Little Yarmouth, and Gorleston. The main streets of Yarmouth run parallel to the river, and are intersected by 145 narrow 'rows,' resembling the 'wynds' of Edinburgh. The sea frontage has a fine marine parade, with the Wellington and Britannia Piers (1854–58) and the Old Jetty (1808). St Nicholas' Church, founded by Bishop Herbert de Losinga, and restored between 1847 and 1884, is one of the largest parish churches in the kingdom, measuring 230 feet in length, 110 in breadth, and 148 across the transept, with a modern spire 168 feet high; a feature of its churchyard is the number of gravestones to drowned mariners. The Nelson Monument (1818) is a Doric column 144 feet high; and one may also notice the new municipal buildings, Queen Anne in style (1882), the covered fish-market (1867), the sailors' home (1860), the aquarium (1876), the royal military hospital (1809), militia barracks, spacious market-place, some remains of the old walls, &c. Yarmouth is the principal seat of the English herring-fishery; and its 'bloaters' are widely esteemed. Deep-sea fishing is also carried on, and there is considerable shipping, the present harbour-channel

of the Yare having been formed in 1559–67, whilst in Yarmouth Roads, inside a line of sandbanks, there is safe anchorage. The exports include fish and agricultural produce; shipbuilding is carried on, and iron, ropes, sails, silk, &c. are manufactured. The town, too, owes much of its well-being to its attractions as a lively watering-place. None of its worthies is more famous than 'Peggotty;' in its history may be noticed its feuds with the Cinque Ports, the plague of 1338–39, which cost 7000 lives, and the fall of a suspension bridge (1845), when seventy-nine persons were drowned. Chartered by King John, it returned two members to parliament from Edward II.'s time till 1867, and regained one of them in 1885; in 1888 it was created a county borough. Pop. (1881) 46,767; (1891) 49,318.

See works by C. J. Palmer (1856), J. G. Nall (1860–66), W. F. Crisp (1871), and others cited at NORFOLK.

Yarmouth, a small seaport in the north-west of the Isle of Wight, 10 miles W. of Newport. It was once an important fortified place, and till 1832 sent two members to parliament. Pop. 800.

Yarn. See COTTON, WOOL, THREAD, &c.

Yaroslav. See JAROSLAV.

Yarrell, WILLIAM, naturalist, born at Westminster in June 1784, was originally a newspaper agent, but, a keen sportsman, soon devoted himself to zoological work, contributing largely to the Transactions of the Linnean and other societies. He died 1st September 1856. His chief works are *The History of British Fishes* (2 vols. 1835–36; 3d ed. 1859) and *The History of British Birds* (3 vols. 1839–43; 4th ed. 1881–85).

Yarrow, a Scottish stream famous in song and ballad, that rises at the meeting-point of Peebles, Dumfries, and Selkirk shires, and flows 25 miles north-eastward till it joins the Ettrick, 2 miles above Selkirk town. About 5 miles from its source it expands into first the Loch of the Lowes (1 by ¼ mile) and then St Mary's Loch (3 by ½ mile; 814 feet above sea-level), the two being separated only by a neck of land on which stands Tibbie Shiels's hostelry. Under SELKIRKSHIRE have been noticed a few of the many memories of that hill-girt lake and the deep swirling stream; and reference may be also made to BALLAD and to Borland's *Yarrow, its Poets and Poetry* (1890), the poets including Hamilton of Bangour, Logan, Hogg, Scott, and Wordsworth.

Yassy. See JASSY.

Yates, EDMUND, journalist and novelist, was born at Edinburgh, 3d July 1831, the son of the actor Frederick Henry Yates (1797–1842), who from 1825 was manager of the Adelphi Theatre. He was educated at Highgate and Düsseldorf, was from 1847 till 1872 in the Post-office, latterly as chief of the missing-letter department, and died 19th May 1894. He published upwards of a score of novels and other works (*Broken to Harness, Running the Gauntlet, Black Sheep,* &c.), was editor of *Temple Bar, Tinsley's,* and other periodicals, and in 1874 founded, with Grenville Murray (q.v.), a very successful 'society' weekly, *The World,* of which next year he became sole proprietor, and which, for a libel on Lord Lonsdale, involved him in 1884 in two months' imprisonment. See his lively *Recollections* (2 vols. 1884), with anecdotes of Dickens, Thackeray, Albert Smith, &c.

Yawl. See SAIL, YACHT.

Yawning either may be the simple result of deficient aeration, or may be brought on by the mere sight of the act in another person, and is a modification of the ordinary movements of respiration, in which the inspiration is deeper than usual, and is accompanied by a kind of spasmodic contraction of the muscles which depress the lower jaw, and by a great elevation of the ribs and to some degree of the shoulder-blades. 'The purely involuntary character of the movement,' says Dr Carpenter, 'is sometimes seen in a remarkable manner in cases of palsy, in which the patient cannot raise his shoulder by an effort of the will, but does so in the act of yawning. Nevertheless, this act may be performed by the will, though not completely; and it is one that is particularly excited by an involuntary tendency to imitation, as every one must have experienced who has ever been in company with a set of yawners.'

Yaws is a disease also called Frambœsia; Button Scurvy; Verruga Peruviana; Peruvian Wart; Buba or Boba, and Patta (West Indies); Framosi (Calabar); Tetia (Congo); Tonga or Coco (Fiji); Lupani and Tono (Samoa); Fr. and Ger. Pian. It is an epidemic and contagious disease, consisting of an eruption of yellowish or reddish-yellow tubercles, which gradually develop into a moist exuding fungus without marked constitutional symptoms, or with such only as result from ulceration and prolonged discharge—i.e. debility and prostration. Incubation varies from three to ten weeks, and yaws usually only occurs once in the same individual. Yaws is distinctly a tropical disease, depending for its origin on extreme heat and moisture, although there must be other causes necessary for its production, as in India, for example, where the same temperature and moisture exist as in countries where it is endemic, it is unknown. Negroes chiefly suffer from it, but no race is exempt. In Africa yaws is found on the west coast from Senegambia in the north to Angola in the south. It obtains all over the western Soudan, and is more rarely seen in the Nile valley and on the northern and north-eastern African coast-line. It is found in Madagascar, Mozambique, in the Moluccas, Java, and Sumatra. It is also endemic in Ceylon, New Caledonia, Fiji, and Samoa; and in the West Indies in San Domingo, Jamaica, Barbadoes, Martinique, Guadaloupe, Sta Lucia, and Dominica. It exists all over Brazil and in Guiana; also at Punta Arenas in Costa Rica. The duration of the disease is from two to six months, but if neglected it may last for several years. If the course of the disease is protracted, the joints are apt to swell, and ulcers form around them, from which an excessive discharge rapidly undermines the patient's strength. The treatment consists of tonics, iodide of potassium, and a generous diet. The patient must be kept very clean, and local applications made either of dilute nitrate of mercury ointment, carbolic acid, sulphate of copper, or sulphate of iron lotions. It should be remembered that the discharge from the sores is capable of producing a fresh crop of yaws in adjacent parts.

Ya'zoo City, capital of Yazoo county, Mississippi, on the Yazoo River (a tributary of the Mississippi), 45 miles by rail N. by W. of Jackson; pop. 5247. For Yazoo Bottoms, see MISSISSIPPI.

Yeadon, a town of the West Riding of Yorkshire, England, on the Aire, 6 miles NW. of Leeds by rail, with woollen manufactures. Pop. (1881) 6534; (1891) 7396.

Year. The origin of this division of time, its duration, and the history of its changes are discussed under CALENDAR. For the ecclesiastical year, which in Europe generally commenced on 25th March, see CHRONOLOGY. In Astronomy there are several kinds of years depending upon the various configurations of the earth in its orbit, and consequently varying in length. First there is the *tropical* or (as it is sometimes incorrectly called) *solar* year, which, from its being recognised in legislation and history, and commonly applied in the measure of time, has also received the name

of *civil* year. This year is defined as the time which elapses from the sun's appearance on one of the tropics to its return to the same, and has a mean length of 365·2422414 mean solar days, or 365 days 5 hours 48 minutes 49·7 seconds. Next is the *sidereal* year, which is the period required by the sun to move from a given star to the same star again, and this year, affected as it is by Nutation (q.v.) only, is one of the most invariable quantities which nature presents us with, and has a mean value of 365·2563612 mean solar days, or 365 days 6 hours 9 minutes 9·6 seconds. The time which elapses between the earth's arrival at its Perihelion (q.v.) and its return to the same position is known as the *anomalistic* year, and is equivalent to 365·2595981 mean solar days, or 365 days 6 hours 13 minutes 49·3 seconds. The *canicular* year—the ancient Egyptian—was counted from one heliacal rising of Sirius to the next. The canicular cycle was the cycle of 1461 years of 365 days each, or 1460 Julian years, also called the *Sothiac* period.

Yeast, the vegetable growth to which Fermentation (q.v.) is due, of value in brewing, baking, &c. Yeast drained and pressed till nearly dry—German barm—may be kept for months. See BEER, BREAD, SUGAR, WINE.

Yedo. See TOKYO.

Yeisk, or EISK, a seaport of the Russian province of Kuban, near the mouth of a small feeder of the Sea of Azov. Pop. 23,500.

Yekaterinburg. See EKATERINBURG.

Yelisavetgrad. See ELIZABETGRAD.

Yell, one of the Shetland Islands (q.v.).

Yellala Falls, the lowest of a series of falls or rapids which interrupt the navigation of the Congo (q.v.) near Vivi, 110 miles from the mouth.

Yellow Bird, a name in the United States of a familiar Warbler (q.v.), and of a goldfinch.

Yellow Fever is also known as Yellow Jack, Bronze John, El Vomito (Span.), Fièvre Jaune (Fr.), Gelbes Fieber (Ger.), Vomito Prieto or Vomito Amarilli (Central America). It is a pestilential, contagious fever of a continuous and special type, presenting at least two well-defined stages, the first occupying 36 to 150 hours, marked by a rapid circulation and high temperature, the second being characterised by general depression and black vomit; as a rule it occurs but once in the same individual. Negroes and Mongolians are little susceptible to yellow fever, and it is noteworthy that strangers are the more liable to be attacked the farther north or south from its area they have been born. New arrivals in an endemic area are most liable to contract the disease; should they escape it at first, they are less liable to suffer from it the longer they reside in one place; should they, however, travel about, they lose what protection they may have gained. The area of distribution of yellow fever is limited. Its endemic areas are on the seacoasts and along the banks of the great rivers in the West Indies, on the Mexican part of the Gulf coast, and on the Guinea coast of Sierra Leone. Epidemics, however, may extend from these foci, but their distribution is limited in Africa to the west coast, from 19° N. to a point on the mainland opposite Fernando Po; in the western hemisphere, from 38° N. to 32° S. lat.—though on the western shores of South America epidemics have occurred from 5° S. to 42° S. They also occur throughout the whole of the West Indies. For the production of yellow fever a dense population is necessary, as also a temperature of above 70° F., a moderate amount of moisture in the atmosphere, and a low altitude. An epidemic of yellow fever will be cut short if the temperature falls to freezing-point, and abundant rains frequently bring an epidemic to an end. As a rule yellow fever does not ascend higher than 3000 feet above sea-level. Domingo Freire of Rio Janeiro believes that a micro-organism (which he calls the cryptococcus xanthogenicus, or micrococcus amarilli) is the cause of yellow fever, but further observations are necessary to substantiate this. The yellow fever poison can be transported farther by sea than on land, and may be carried by clothing, bedding, &c., which may retain the poison for a considerable time. The symptoms of the disease may be briefly described as follows: The patient usually suffers for two or three days from loss of appetite, lassitude, and discomfort. Then suddenly he will be attacked by severe rigors, alternating with flushes of heat. There is violent headache, the pulse is regular but throbbing, thirst is usually severe; the tongue, coated in the centre, presents a red edge, and deep-seated pain at the back of the eyeball is almost invariably complained of. Constipation, which obtains throughout the disease, should be noticed, and the patient vomits at short intervals. The skin assumes a yellowish or livid colour, and is covered by cold perspiration. The urine is acid and contains a large amount of albumen. The respirations are frequent, and the temperature is about 105° or 106° in the axilla. On the third or fourth day the vomiting becomes more distressing, the urine is scanty or may be suppressed, the temperature rises still higher, and the skin grows harsh and dry. The skin becomes exceedingly yellow, and may be even the colour of mahogany. The face is flushed, the conjunctivæ injected, and the eyes are protruded. The vomited matter at this time is limpid, slightly opalescent, and acrid; it is called the white vomit. The patient is very distressed and often delirious.

At this point the condition of the patient will improve somewhat, and in rare cases convalescence may set in, but as a rule the improvement only lasts from eight to twenty hours, during which period all untoward symptoms subside, with the exception of a certain amount of gastric irritation. If these favourable symptoms do not continue, the patient sinks into a state of extreme prostration; pains in the head, the orbits of the eyes, the loins, and joints return, the pain in the stomach being so severe that the patient can hardly endure the weight of the bedclothes. The tongue becomes parched and grey, the gums and teeth black with sordes, the lips dry, brown, and bleeding, and then the terrible 'black vomit' (*vomito negro*) sets in. At first it may be of a bright red colour, but it soon becomes a deep, brownish black. The patient may vomit thirty or more times in the twenty-four hours. This characteristic vomit is produced by severe irritation. The disease may terminate in various ways, the mortality varying from 10 to 70 per cent. Death may result from the direct action of the poison upon the blood and nervous system, or from suppression of the functions of the liver or kidneys, from syncope due to fatty degeneration of the heart, or from hæmorrhage. In rarer cases pyæmia may ensue and the patient succumb to blood-poisoning.

The treatment of yellow fever may be considered under two heads: (1) prophylactic; (2) curative. Hitherto no prophylactic treatment has been proved certainly effective. Freire claimed that inoculation with an attenuated virus will in most cases render patients insusceptible to yellow fever; but hostile critics doubted his successes, and held that the risks were too great. Meyrignac claimed to have inoculated Panama Canal labourers with success by a quite different preparation of virus. Finlay of Havana used the mosquito for inoculating healthy individuals with yellow fever, and such apparently

escaped the scourge. Sanarelli discovered the *Bacillus icteroides*, and in 1898 used successfully a serum method. The curative treatment presents innumerable difficulties, and it must be remembered that drugs which are successful in one epidemic are apparently useless in another; therefore the general lines of treatment alone can be indicated. The patient should be kept in bed in the recumbent position; each patient requires 2000 cubic feet of space; draughts should be avoided, and the temperature should be carefully regulated; the patient should be warmly but lightly clad, heavy bedclothes being avoided. We know of no drug which will arrest yellow fever, and quinine is useless unless malaria should complicate the fever. It follows, therefore, that symptoms must be combated as they arise. Calomel and jalap and sweet nitre are useful, as are stimulating frictions over the spine and lower extremities. Hot-air baths are also useful, especially if there is any tendency to suppression of urine. The patient's thirst may be relieved by iced water or ice, and the irritability of his stomach may often be allayed by the administration of dilute hydrocyanic acid. The black vomit will be best controlled by the administration of turpentine and sulphuric ether. Opium may be used to alleviate pain if the kidneys are acting freely. Hyperpyrexia must be combated by the administration of aconite, or by sponging the body with cold water. The diet must be light and nutritious, and should be given in small quantities at regular intervals throughout the disease. It should consist of chicken-broth, beef-tea, corn-flour, barley-water, or iced milk and lime-water, all solid food, even bread, being best avoided. For the suppression of the urine perhaps the best treatment is the administration of an enema of iced cold water. During convalescence the bowels must be kept open, light and nourishing diet with small doses of brandy should be given, or if preferred, the patient may take port wine. If during the course of yellow fever the prostration is very great, alcohol will be necessary, but in moderation; champagne is the best form in which to administer it.

Yellow-hammer, or YELLOW-BUNTING (*Emberiza citrinella*), a species of Bunting (q.v.), common in the British Isles, most parts of Europe,

Yellow-hammer (*Emberiza citrinella*), with Nest and Eggs.

and Asia Minor and Persia. It is of a somewhat short, thick form, about 6½ inches in entire length. The male's summer plumage is brilliant, bright lemon yellow (especially on head, cheeks, chest, &c.), contrasting with chestnut and dusky black. The tail is slightly forked, and is shorter than that of the common bunting. The female has much less yellow about the head than the male, and her plumage is altogether much less vivid. The bird's food consists of insects, blackberries and other wild fruits in summer, and seeds and grain in winter. It generally makes its nest on or near the ground, under shelter of a bush or a bank, forming it of moss, dry grass, and hair. The song of the male is very sweet, and consists of few notes, which have been jocularly set to the words, '*Little-bit-of-bread-and nō chē-cse.*' He is remarkably attentive to his mate, and takes his turn in incubation. In many parts of Britain boys who would think it wrong to rob any other bird's nest esteem it a permissible kind of duty to rob that of the yellow-hammer. In Italy great numbers of yellow-hammers are caught, and fattened like ortolans for the table. It is a noteworthy circumstance that this bird is more rare in insular situations, in the islands of the Mediterranean, as well as the Orkneys. The name is a corruption of yellow-ammer; the Anglo-Saxon *amore* (cf. Ger. *ammer*). In Scotland the yellow-hammer is known as the Yoldrin or Yite.

Yellow Pigments. For artistic work in oil yellow ochre (see OCHRES), raw sienna (a native earth), cadmium yellow (cadmium sulphide), aureolin (a compound of cobalt and potassium nitrites), lemon yellow (barium chromate), and Naples yellow (basic lead antimoniate) are all permanent; but cadmium yellow and aureolin, which require to be carefully prepared, have a tendency to injure a few other colours when mixed with them. Gamboge (q.v.) and Indian yellow (prepared in India from cows' or camels' urine) are beautiful pigments, transparent or translucent, and much used in water-colour painting, but also to some extent as oil-colours. They have both, however, a decided tendency to fade. The other pigments named above are likewise used as water-colours, and are permanent, except Naples yellow, which is unsuited for water-colour painting. Cadmium and lemon yellows are opaque colours, or at least are so to a considerable extent. House-painters use yellow ochre and chrome yellow (chromate of lead) largely. The latter is of a more lively hue than the former, but it is not nearly so durable. Raw sienna is much used for graining painted wood to imitate oak. Yellow lakes, which include brown pink and Italian pink, are beautiful but fugitive colours. They are generally prepared from quercitron bark, but sometimes from Persian berries.

Yellow River. See HOANG-HO.

Yellow Sea, or WHANG-HAI, an important inlet of the Pacific Ocean, washes the north part of the east coast of China, and lies between the Chinese provinces of Shan-tung and Chiang-su on the one hand and Corea on the other; it terminates on the north-west in the Gulf of Pe-chi-li, and opens out in the south-east into the Tung-hai, or Eastern Sea. By degrees it is becoming shallower owing to the quantity of alluvium borne down into it by the rivers Hoang-ho (q.v.) and Yang-tsze (q.v.).

Yellowstone, the largest affluent of the Missouri River, rises high up in the Rocky Mountains in Wyoming, about 44° N. lat. and 109° 35′ W. long., flows 25 miles north-west to the mountain-girt Yellowstone Lake (22 miles long, 7788 feet above sea-level), thence northward through the National Park into Montana, partly through stupendous cañons, and then east-north-east and north-east to the Missouri, on the western border of North Dakota. It is some 1300 miles long, and is navigable for steamboats 300 miles, to the mouth of the Big Horn, its largest affluent.

The *Yellowstone National Park* occupies the extreme north-western corner of Wyoming, and forms a square about 75 miles in diameter. Its area was originally 3575 sq. m., to which congress in 1891 added a tract of nearly 2000 sq. m. to the south and east—nearly all more than 6000 feet

above sea-level, and rising in the snow-covered mountains to 10,000 to 14,000 feet. Situated on the 'Great Divide,' 'its pine-clad mountains form the gathering-ground for the head-waters of large rivers flowing away to the Atlantic and Pacific oceans;' and for the sake of the rainfall and the rivers its forests are carefully preserved. The region is remarkable as well for its scenery as for its famous hot springs and geysers. The river has two falls about 15 miles below the lake, the lower one a magnificent cataract 330 feet in height; then it passes through the Grand Cañon (20 miles), and receives Tower Creek, which itself has leapt out of a deep and gloomy cañon known as Devil's Den over a beautiful fall of 156 feet. Near the river are many of the hot springs, those of White Mountain, near the northern boundary of the Park, extending for 1000 feet up the sloping side, and their snow-white calcareous deposits standing like a series of great frozen cascades. The semicircular basins, in which the water gathers in pools, and from one to another of which it flows over with gradually lessening temperature, are bright with bead-like tracery of scarlet, yellow, orange, and green on the white groundwork—the colours being nearly always due to the presence of certain coloured algæ that live in waters of high temperature, and by whose instrumentality the great siliceous and calcareous sinter deposits have been built up. A few miles from Sulphur Mountain, with its vapours rising from fissures and craters, is the active Mud Volcano, with a crater 25 feet in diameter. All the hot springs of the Park number nearly 10,000. But the most singular feature of the region is its geysers (see GEYSER, and illustration there), the most magnificent in the world. These are found principally on the Firehole River, a fork of the Madison, at the western end of Shoshone Lake, and in the Norris basin, to the north of that on the Firehole. The region was visited and described by surveyors in 1869, and explored and mapped in 1871. In 1872 congress dedicated and set it apart 'as a public park or pleasuring ground for the benefit and enjoyment of the people.' At the same time it provided against the wanton destruction of fish and game, or their capture or destruction for merchandise or profit; and, as a happy result of this enactment, several hundred bisons and some thousands of elk, antelopes, Rocky Mountain sheep, &c. have found a refuge within the Park. A branch of the Northern Pacific Railway extends to the northern boundary of the Park. According to the report of 1898, everything was going admirably; though the bisons do not increase, the wapiti and many other species have greatly increased. The cavalry police is very efficient.

See the *Official Guide*, and books by Hayden (1877), Synge (1892), Wiley (1893), and Chittenden (1896).

Yellow Wood. See FUSTIC, SATIN-WOOD.

Yemen. See ARABIA, SABÆANS.

Yenikale. See KERTCH.

Yenisei', one of the largest rivers of Siberia, formed by the junction of the Shishkit and Beikhem, which rise in the mountains on the southern border of Siberia. It flows north through the centre of Siberia into the Arctic Ocean, forming at its mouth a long estuary, and has a total course of about 3200 miles. It is navigable 1850 miles to Minusinsk. Its chief tributaries are the Angara or Upper Tunguska from Lake Baikal and the Lower Tunguska. For the navigation, &c. of the Yenisei, see SIBERIA, p. 427, and KARA SEA. See too Henry Seebohm's *Siberia in Asia: a Visit to the Valley of the Yenesay* (1882).

Yeniseisk, a town of Eastern Siberia, in the province of Yeniseisk, whose capital, however, is Krasnoiarsk. Yeniseisk stands on the Yenisei River, has a pop. of 8000, and a good deal of trade, depending largely on the gold and other mines of the district. The great Siberian railway route passes through Krasnoiarsk. For the (undeciphered) inscriptions found in this region, see *Les Inscriptions de l'Ienissei* (Helsingfors, 1889).

Yeoman (apparently from an assumed A.S. *gaman* or *geáman*, 'a villager;' from same root as Ger. *gau*, and *man*), a term which seems, in early English history, to have been applied to a common attendant menial servant, but after the 15th century came to denote a class of small freeholders, forming the next grade below gentlemen (see FRANKLIN). The term yeoman was also given to the forty shillings freeholder (see PARLIAMENT) or, more loosely, to any small farmer or countryman above the grade of labourer. The term is also familiar in the titles of functionaries in royal households, such as Yeoman Usher of the Black Rod, Yeoman of the Robes, &c.

YEOMEN OF THE GUARD, a veteran company, consisting of old soldiers of stately presence, employed on grand occasions in conjunction with the gentlemen-at-arms as the bodyguard of the sovereign. These yeomen were constituted a corps in 1485 by King Henry VII., and they still wear the costume of that period. Armed with partisans, and in their quaint uniform, the men present a singularly picturesque aspect. The officers of the corps are a captain (ordinarily a peer), a lieutenant, and an ensign—all old army officers. The whole charge is borne by the sovereign's civil list. The Beef-eaters (q.v.) or warders of the Tower are an entirely different corps, but since the reign of Edward VI. wear the yeoman's uniform, without the shoulder-belt. See Preston's *Yeomen of the Guard* (2d ed. 1887).

Yeomanry, a British force of cavalry for home defence, a large proportion of which, however, volunteered for service in South Africa in 1899-1901, and did admirable work in the field. The 'Imperial Yeomanry' there (mounted infantry rather than cavalry, in strictness) included a large number of new recruits not already in the yeomanry, and amounted in all to 79 companies. The normal number of the yeomanry at home has been about 12,000. The force, now forming 38 regiments and 18 brigades, was originally formed during the wars of the French Revolution, and then comprised infantry as well as cavalry; but all the infantry corps, and many of the cavalry, were disbanded after the peace of 1814. The organisation of the corps is by counties, under the lords-lieutenant. Troops are raised and drilled locally, and then assembled by regiments for training (eight days). The men provide their own horses and uniform, receive annually a clothing and contingent allowance of £2 a man, and draw during the annual training 2s. a day for forage, besides a subsistence allowance of 7s. a day. If called out for permanent duty, they receive cavalry pay, with forage allowance. Unlike the volunteers, yeomanry can be called out in aid of the civil power; and in time of invasion, or apprehended invasion, the sovereign may embody them for service in any part of Great Britain. When serving they are subject to military law under the provisions of the Army Act of 1881, and are then on the same footing as regular soldiers.

Yeovil, a town of Somerset, 40 miles S. of Bristol and 123 WSW. of London, is a busy, handsome place, built of red brick and yellow stone, and situated on a hillside sloping to the Yeo. St John's Church, 'the Lantern of the West,' is a fine Perpendicular structure of the 15th century, restored in 1864, with a tower 90 feet high. A Grecian town-hall was built in 1849. The woollen

industry belongs to the past; but the manufacture of kid and other gloves is largely carried on. Yeovil, which lost 117 houses by fire in 1449, is a borough by prescription, since 1853 under the Municipal Act. Pop. (1861) 7957; (1891) 9648.

Yesso. See YEZO.

Yetholm, a Border village of Roxburghshire, at the foot of the Cheviots, 7½ miles SE. of Kelso. Bowmont Water divides it into Town-Yetholm and Kirk-Yetholm, the latter long the headquarters of the Scottish Gypsies, who seem to have settled here as early at least as the 17th century, and whose last 'queen,' Esther Faa Blythe (1797–1883), was visited here by Borrow and C. G. Leland. Pop. (1841) 944; (1891) 590. See works by Dr W. Baird (1862), Lucas (1882), and Brockie (1884).

Yew (*Taxus*), a genus of the natural order Taxaceæ (generally regarded as a sub-order of Coniferæ), characterised by solitary and terminal fertile flowers, with a solitary ovule sessile in the centre of a fleshy disc, forming a sort of drupe when in fruit. The genus Taxus is distinguished by a solitary terminal seed, surrounded by a succulent cup. The species are diffused over the whole northern parts of the world, and are large and beautiful evergreen trees, with narrow lanceolate or linear leaves. The Common Yew (*T. baccata*),

Branch of Yew (*Taxus baccata*).

a tree of 30 to 40 feet, and a trunk sometimes of great thickness, branching a few feet above the ground, and forming a large and dense head, is a native of the middle and south of Europe and of Siberia. Noble specimens of it are to be seen in many parts of Britain. It attains a great age, at least 300 or 400 years: for one in Darley Dale churchyard, Derbyshire, an age is claimed of 'as much as three thousand years,' this tree being 33 feet in girth; and an equal longevity is ascribed to the Fortingal Yew, near Aberfeldy, in Perthshire, which is now a mere wreck, but in Pennant's day (1772) girthed 56 feet. The wood has been much used from very early times for making bows, for which it is preferred to every other kind of wood. It is very hard, and reckoned almost equal to boxwood for fine work. Like the box, it occupies an important place in the old 'topiary' style of landscape gardening, being clipped into dragons, peacocks, and the like, and forming close, trim hedges. The heart-wood is of an orange-red or deep-brown colour. The fruit is red, and was long reputed poisonous, but the pulpy part is not so; the seed, however, is a dangerous poison. The leaves are a powerful narcotic, and are sometimes given as a vermifuge. The Irish Yew (*T. fastigiata* of Lindley; *T. hibernica* of Hooker) is by many supposed to be a mere variety of the common species, with upright fastigiate habit, but it differs also in having the leaves scattered, whilst those of the common yew are in two rows. The North American Yew (*T. canadensis*) is of a humbler growth. The name Japan Yew is sometimes given to the nearly allied *Podocarpus macrophyllus*. Other species of Podocarpus are natives of the warmer parts of Asia, of Chili, Australia, &c. *P. nucifer* is a lofty tree of the northern provinces of Japan and mountains of Nepal, from the seed of which a culinary oil is extracted. To the order or sub-order Taxaceæ belong also the genus Salisburia (see GINGKO), the genus Dacrydium (q.v.), and Phyllocladis, a genus in which the foliage, as in Salisburia, has a remarkable resemblance to the fronds of ferns.

Yezd, or YAZD, a city near the centre of Persia, on a comparatively small oasis, beyond which is salt and sandy desert bounded by mountains. It is on the route between Ispahan and Kerman, has miscellaneous manufactures and a considerable trade in sugar, silks, opium, felt, copper, and arms. Pop. 40,000, of whom some 2000 or 3000 are Guebres or Parsees (q.v.) in faith, and are now said to be well treated both by the authorities and inhabitants.

Yezîdis, a Kurdish people. See KURDISTAN.

Yezo, or EZO, less correctly YESSO, the most northerly of the four great islands of Japan, is in size about equal to Ireland, and is still only partially settled. Its official name is *Hokkaido*, or 'Circuit of the Northern Sea,' received in 1870, when it was brought under a special colonisation department. An agricultural mission from the United States assisted in founding model-farms, laying out roads, and building bridges. The capital was changed from Matsumae to Sapporo, which was provided with a railroad to Otam, its port, and to Poronai, the great coal district inland. An agricultural college, breweries, canning factories, beet-root sugar factories, &c. were established, but with inconsiderable results. The coal-mines are worked by convict labour. A system of military settlements has of late years been put into force, partly with the view of furnishing a militia against possible invasion from Russia, which is supposed to covet the fine harbours of Yezo. The exposed port of Otam will probably be soon abandoned for the more sheltered harbour of Mororan, on Volcano Bay, now a naval harbour, to which a railway from Poronai mines has been built. The principal products of Yezo are coal, seaweed, sulphur, fish, the catches of salmon on the river Ishikari being sometimes enormous. The fauna and flora of Yezo differ materially from those of the main island, the bear being a different species resembling the grizzly. There are no monkeys; a species of grouse is found. The deer, once very plentiful, are now comparatively scarce. The Yezo pony, originally from Nambu on the main island, is hardy, and foreign blood has been introduced, promising good results. The original inhabitants of Yezo were probably pit-dwellers, of whom distinct traces have been found at Sapporo, Nemuro, and elsewhere. After these came Ainos (q.v.) or Ainus, whose principal settlement is at Piratori, 50 miles east of Mororan. The bear-festival, in September, is the great event of their year. The Ainos number 15,000, a population either stationary or decreasing; they are harmless, lazy, and drunken. The southern corner of the island was wrested from them in the 16th century, and the castle of Matsumae, in the extreme south-west, became in the next century the headquarters of Japanese rule. At the restoration in 1868 the

supporters of the Tokugawa government made a last stand here, and were finally defeated at Hakodate. Yezo has a rigorous climate, being for six months of the year under snow and ice (2 feet in the south to 8 feet in the north). The centre of the island is but little known, although it has been crossed twice or thrice by Japanese and European explorers; the Ainos live mostly near the mouths of the rivers. The interior is mountainous and inhospitable; there are several active volcanoes.

See books quoted at AINOS; also Blackiston's *Japan in Yesso* (1882); Chamberlain's *Memoirs on the Ainos* (1888); Batchelor's *The Ainu* (1892).

Yggdrasil. See SCANDINAVIAN MYTHOLOGY. According to Vigfusson and Powell (*Corpus Poeticum Boreale*, 1883), Yggdrasil is not a primitive Scandinavian idea, but originating after the contact with Christianity, and so a corruption of the cross.

Yiddish. See HEBREW, SLANG (p. 496).

Yilgarn. See WESTERN AUSTRALIA.

Yoga, a system of Hindu philosophy (see SANSKRIT, Vol. IX. p. 153). *Yogin* is a follower of that system, but in popular acceptation a term generally denoting a Hindu ascetic or devotee.

Yokohama (pop. 180,000) is the chief port of entry in Japan, and the headquarters of foreign shipping companies, banks, consulates, and commerce generally. Until the opening of the country in 1854 it was an insignificant fishing-village, contiguous to the important town of Kanagawa, originally granted as a treaty settlement. The obstructions offered by the Japanese and the impatience of foreign merchants led to the practical abandonment of Kanagawa, which, however, still remained nominally the seat of the various consulates. Yokohama is a poorly laid-out town with narrow winding streets. The Bluff, however, conceded for residence in 1867, is a beautiful spot, commanding fine views of Fuji-san and of Yokohama Bay. The bay is very beautiful, and, though only an open roadstead, affords a good and commodious anchorage, not only to extensive mercantile shipping, but also to the naval squadrons of Great Britain, France, Germany, Russia, and other powers. Work on a large harbour was carried out in 1889–96, the main object of which was to prevent the gradual silting up of the anchorage; it is enclosed by two breakwaters 1¼ mile long, and an iron pier, 1900 feet long, connected with the railway to the capital, 17 miles off. Yokohama is a centre for tourists visiting Japan. The foreign community here is the largest in the country; after the Chinese, British residents, chiefly merchants and brokers, bulk most largely. There is an imperial health laboratory here, admirably conducted. The entire foreign trade of Yokohama aggregates from £15,000,000 to £20,000,000 a year, the exports having a value of nearly double the imports. Silk represents three-fifths of the exports, the rest being other tissues, tea, rice, copper, curios, &c.; the imports are cottons and woollens, raw sugar, oils, metals, chemicals, arms and ammunition, watches, &c.

Yonge, CHARLOTTE MARY, a popular novelist, and an author of considerable range and versatility, the only daughter of W. C. Yonge, of Otterbourne, Hants, was born in 1823. She gained a large constituency of readers by her *Heir of Redclyffe* (1853) and its successors, and her industry may be judged from the fact that within forty-four years (1848–92) she had published at least 112 volumes, or almost three annually, besides works translated and edited, and the editorship of the *Monthly Packet*. Her novels are natural, show dramatic skill and literary grace, and inculcate a healthy morality; many of them are made the vehicle of High Church opinions. A portion of the profits of the *Heir of Redclyffe* was devoted by the authoress to fitting out the missionary schooner *Southern Cross* for Bishop Selwyn. The profits of the *Daisy Chain*, amounting it is said to £2000, she devoted to the building of a missionary college at Auckland, New Zealand. In addition to fiction Miss Yonge has published several historical works, a work on *Christian Names* (1863), a *Life of Bishop Patteson* (1873), and a monograph on *Hannah More* (1888). An illustrated edition of her more popular novels and tales was issued (1888–89) in 35 volumes.

Yoni. See LINGA.

Yonkers, a city of New York, on the Hudson River, opposite the Palisades, and 15 miles by rail N. by E. of the Grand Central Depôt of New York. It manufactures silk, hats, machinery, mowers, elevators, &c., and, with its numerous villas, is rapidly becoming a suburb of the metropolis, whose northern boundary touches it. Pop. (1880) 18,892; (1890) 32,033.

Yonne, a department in the north-east of France surrounded by the departments of Seine-et-Marne, Aube, Côte-d'Or, Nièvre, and Loiret. Area, 2868 sq. m.; pop. (1886) 355,364; (1891) 344,688. The department is watered by the river Yonne, which flows across it in a north-east direction. The surface is hilly, many of the hills being covered with fruitful vineyards, the intervening valleys being beautiful and fertile. There are some fine forests in the department. The vineyards yield large quantities of wine, the best being those of Chablis, Auxerre, and Tonnerre. The chief mineral products are red granite, marble, limestone, and ochre; and there are some miscellaneous manufactures. Its arrondissements are Auxerre, Avallon, Joigny, Sens, Tonnerre; the capital is Auxerre.

York, the county town of Yorkshire, is situated at the confluence of the river Foss with the Ouse, 188 miles N. of London by rail. It is the seat of an archbishopric, the centre of the northern military district, and returns two members to parliament. The population of the municipal borough in 1881 was 61,789, and in 1891 (now a 'county borough') 66,984. The city, together with the surrounding district called the Ainsty, is under the jurisdiction of a lord mayor, twelve aldermen, and thirty-six councillors. York was known as Eboracum under the Romans, of whom many relics still remain, chief among them being the building known as the multangular tower. The numerous sepulchral monuments, pavements, and other relics now preserved in the museum were mainly found in the extensive Roman cemetery discovered in digging the foundations of the railway station. From the time of Henry II. for five hundred years parliaments occasionally sat at York, as the name of Parliament Street still bears witness, while under Henry III. the courts of King's Bench and Exchequer were held here.

The Minster is among the most magnificent of English cathedrals, and is of especial architectural interest owing to the fact of the fabric-rolls having been preserved, so that we know the precise dates at which the various portions were erected. Early in the 7th century Edwin, the first Christian king of Northumbria, founded, on the site of the present Minster, a church which perished by fire in 741. The church was rebuilt, but, during the conflagration of the city at the time of the Norman invasion, was again destroyed, with the exception of the central wall of the existing crypt, which also contains portions of the Norman church erected by Archbishop Roger (1154–81). Early in the following century the beautiful Early English transepts were added by Archbishop Gray. The present nave was built between 1291 and 1345; the graceful

Decorated Chapter-house (q.v.) between 1300 and 1330; and the Norman choir was replaced by a Perpendicular one, 1373–1400. The central lantern tower belongs to the beginning of the 15th century, and the two western towers were added between 1430 and 1470. In 1829 the roof and carved choir-stalls perished in an incendiary fire, and in 1840 another fire destroyed the roof of the nave and the splendid peal of bells, reducing the south-western tower to a mere shell. Especially worthy of notice is the Decorated stained glass, the great east window being almost unrivalled. The extreme

York Minster.

length of the Minster is 524 feet, of the transepts 250, and the breadth of the nave is 140 feet, the height of the central tower is 216, and of the western ones 201 feet.

The Benedictine Abbey of St Mary possessed great wealth and importance. It was founded in the reign of Rufus, but was largely rebuilt towards the end of the 13th century. In 1132 a small body of the monks, wishing to adopt the stricter Cistercian rule, seceded in spite of violent opposition, and finally founded the great Abbey of Fountains (q.v.). The existing ruins are principally those of the beautiful abbey church, while the old Guest-house has now been appropriated as a storehouse for Roman and other antiquities. At the Reformation York contained forty-one parish churches, of which twenty-two now remain, several new ones having been added. There is a fine Roman Catholic pro-cathedral (1864). The present walls, 2¾ miles in circuit, are mainly of the time of Edward III., though in many parts they follow the line of the Roman earthwork. They are pierced by picturesque gates, locally called Bars, of which Bootham Bar and Micklegate Bar are especially well preserved. The castle, with its picturesque Clifford's Tower, is situated close to the river, and is believed to date from the time of Edward I., though older portions may be included in the structure, which suffered severely during the siege of 1644. The Assize Courts are now held in a portion of the building. The fine Gothic structure of the Guild-hall belongs to the 15th century.

There are several endowed schools: St Peter's School, under the government of the Chapter, founded in 1557; Archbishop Holgate's Free School, dating from the time of Henry VIII.; the Blue-coat School for boys, the Grey-coat for girls, and the Yorkshire School for the Blind. Among other institutions may be enumerated the County Hospital, the Dispensary, and the Lunatic Asylum. York is an important railway centre, and its station (1873–77) is one of the largest in England. The British Association was organised at York in 1831, and its jubilee meeting was appropriately held there in 1881. For other events in the history of the city, see YORKSHIRE.

York, the capital of York county, Pennsylvania, on Codorus Creek, 28 miles by rail SSE. of Harrisburg. It has a large granite court-house, a handsome collegiate institute, numerous churches, and several foundries, car-factories, railway-shops, planing-mills, and manufactories of shoes, condensed milk, &c. York, which is a pleasant town, dates from 1741, and was the seat of the Continental congress for a time in 1777. Pop. (1880) 13,940; (1890) 20,793.

York, a river of Virginia, formed by the union of the Pamunkey and Mattapony, flowing south-east to Chesapeake Bay, nearly opposite Cape Charles. It is 40 miles long, and from 1 to 3 miles wide.

York, THE DUKEDOM OF, has been frequently conferred by the king of England on his second son. Edward III. bestowed it on his fourth son Edmund, who founded that House of York which formed the one side during the Wars of the Roses (see ROSES, WARWICK, and Sir J. Ramsay's *Lancaster and York*, 1892), and which in the persons of Edward IV., Edward V., and Richard III. occupied the throne of England. Henry VIII. and Charles I. were dukes of York while their elder brothers were alive; James II. till his accession. The Old Pretender conferred the dignity on his son, afterwards Cardinal York (see STEWART, p. 726). George I. honoured with this title his brother Ernest Augustus, prince-bishop of the secularised see of Osnabrück (d. 1728); and in 1760 the rank fell to Edward Augustus (1739–67), George III.'s brother. George III. gave it to his second son, Frederick Augustus, prince-bishop of Osnabrück (1763–1827), who showed his military incapacity in command of an expedition to the Netherlands against the French in 1793, and again in 1799, having in 1795 been made commander-in-chief of the British army. He had to resign that post because of the shameful traffic in military appointments carried on by his mistress, Mrs Clarke, but was reinstated (1811). The title was next in abeyance till May 1892, when the dukedom was conferred on Prince George Frederick Ernest Albert, second son of the Prince of Wales, who by the death of his elder brother the Duke of Clarence and Avondale in January of the same year had become heir to the crown of England. Born at Marlborough House on 3d June 1865, Prince George was trained as a naval officer; and his brother's and his own diaries of their cruise on

H.M.S. *Bacchante* (1879–82) were published in 1885. He was appointed to the command of the *Thrush* in 1890, and in 1891 became a commander.

York, CARDINAL. See STEWART, p. 726.

Yorke, PHILIP, EARL OF HARDWICKE (1690–1764), rose through all the legal dignities till in 1737 he became Lord Chancellor. He supported Walpole, and held office under the Duke of Newcastle. His name is associated with the Marriage Act of 1754 which put an end to Fleet marriages (see FLEET PRISON).

Yorkshire is by far the largest of the English counties. It is bounded on the E. by the sea, separated on the N. by the river Tees from the county palatine of Durham, divided mainly from Westmorland and Lancashire by the water-parting of the Pennine chain on the W., and bounded on the S. by Derbyshire and Notts, while the Humber separates it from Lincolnshire. The western boundaries of the county were not fixed till the erection of the Earldom of Lancaster in the reign of Henry III., in Domesday Book the northern part of Lancashire and portions of Westmorland and Cumberland being included in the West Riding. For administrative purposes Yorkshire is divided into three Ridings (*thridings*, or 'thirds'), each of which has its own lord-lieutenant, magistracy, and constabulary. There are eleven wapentakes in the North Riding, nine in the West Riding, and six in the East Riding. The wapentake of the Ainsty, or county of the city of York, is a 'peculiar,' under a jurisdiction of its own, that of the lord mayor and aldermen of York; but it is included in each of the three Ridings for certain specific purposes. Sundry subdivisions of the county go by the name of shires, as Hallamshire, Richmondshire, Allertonshire, Howdenshire, Cravenshire or Craven, Holderness, and Cleveland. The county contains three cities, York, Ripon, and Wakefield, 19 municipal boroughs, 59 market-towns, and 1639 parishes and townships separately rated for the poor. The total area is 3,882,851 statute acres, or nearly 6067 sq. m., all, with the exception of the catchment basins of the Esk and parts of those of the Tees and Ribble, being drained by the Ouse and its great tributaries, the Swale, the Ure, the Nidd, the Wharfe, the Aire, the Don, and the Derwent. Since 1885 the county divisions have returned twenty-six members, and the cities and boroughs the same number. Pop. (1801) 859,133; (1841) 1,592,059; (1881) 2,886,564; (1891) 3,208,813, of whom 399,412 were in the East Riding, 368,237 in the North, and 2,441,164 in the West Riding.

In Yorkshire the older rocks lie mainly to the north-west, and the newer to the south-east. On the extreme western border of the county are found the most ancient strata—viz. the slates and flags of Hougill Fells and Ingleton. These are overlaid by the mountain-limestone and the millstone grits of the Pennine chain, which are intersected by the magnificent dislocation of the great 'Craven fault,' to which is due some of the most striking scenery in Yorkshire. The lift varies between 300 and 3000 feet, causing the precipitous cliffs of Gordale, Malham, Settle, and Ingleborough, which are honeycombed by extensive caves. The Pennine chain rises to its highest point in Mickle Fell, 2581 feet, while Ingleborough and Whernside touch respectively 2361 and 2384 feet. On the eastern side of the chain are the famous 'Yorkshire dales,' Wensleydale, Wharfedale, Swaledale, and others, in many of which are picturesque waterfalls, or forces, as they are locally called—such as Caldron Snout and High Force in Teesdale, or Aysgarth Force and Hardraw Force on the Ure, where the rapid mountain-streams leap over ledges formed by the harder strata of the mountain-limestone. The Yorkshire coal-measures, on which are situated the manufacturing towns of Leeds, Bradford, Sheffield, Rotherham, Huddersfield, and Halifax, are confined to the southern portion of the county, and are continuous with the coalfields of Derbyshire and Notts. In the North Riding we have a great development of the Lias, in which are imbedded the ammonites well known to visitors at Whitby; while the Cleveland moors, which rise to heights of 1400 feet, are dissected by a great trap dyke running from west to east, which is extensively quarried at various points for road-metal. The prosperity of Middlesborough is due to the celebrated hematite iron ores of Cleveland, which have been extensively worked of late years. In the East Riding the Oolitic beds are overlaid by the Kimmeridge Clay and by the Chalk, which forms the high tableland of the Wolds, while the greater part of Holderness is covered by a thick superficial stratum of glacial drift and alluvium. The rich level tract of the Vale of York also consists of glacial and alluvial deposits, thickly overlying and concealing the New Red Sandstone.

The sepulchral barrows on the Wolds, and the caves of Craven and Kirkdale have yielded results of the highest importance, forming the basis of our knowledge of the prehistoric animals and races of Yorkshire. At the time of the Roman conquest the country was inhabited by the Celtic tribe of the Brigantes, or 'hillmen,' whose capital was at Boroughbridge (*Isurium*), where gigantic monoliths still bear witness to their rule. The country was invaded by the Romans about 50 A.D., more than a century after Cæsar's landing in Kent, the conquest being completed in the reign of Vespasian, by Agricola, *c.* 79 A.D. York (*Eboracum*) is first mentioned as being the headquarters of the Sixth Legion, which came into Britain with Hadrian, and for 300 years remained stationed at York, which became the chief city of Northern Britain, the surrounding country being studded with camps and covered with a network of Roman roads. Several of the emperors visited York, and here in 211 died Severus, and in 306 Constantius Chlorus. And from York his son Constantine the Great, having been proclaimed by the soldiery, set forth to assume the purple. In 410, in consequence of the Vandal invasion of Gaul, the legions were withdrawn by Honorius, and for 150 years utter darkness closes in, and envelops the overthrow of the Brito-Roman civilisation, and the establishment of the Teutonic kingdoms. The earthen ramparts, thrown up to hinder the march of the invaders, may still be traced. In 500 A.D. St Samson of Dol, we are told, was driven from his bishopric of York, and in the middle of the 6th century (547) we find that the heathen Angles had established their rule, although the little British kingdoms of Leeds (*Loidis*) and Elmet held out till 616, when they were conquered by King Edwin of Northumbria, the Yorkshire portion of whose realm was known as Deira. Edwin, who had been baptised by Paulinus on Easter Day, 627, was defeated and slain at Hatfield Chase near Doncaster in 633, by Penda, the heathen king of Mercia. Toward the end of the 8th century the Northmen began to appear in the Humber, ravaging and finally settling in the country; while York became the capital of a Danish kingdom.

In 1066, three weeks before the battle of Hastings, Harold and Earl Morkere issued from York to vanquish the Norwegian army at Stamford Bridge. It was not until 1068 that William marched into Northumbria, and on the suppression of the final struggle for independence in the following year a broad belt of country underwent that ruthless devastation of which we find notable

traces in Domesday Book. Henceforth Yorkshire is known by its modern name.

At the battle of the Standard, fought near Northallerton, David, king of Scotland, was repulsed in 1138 by the northern barons. During the Wars of the Roses, Richard, Duke of York, was defeated by Queen Margaret and slain at the battle of Wakefield, in 1460; and in the next year Edward IV. won the bloody victory of Towton over Henry VI. The year 1536 is signalised by the rebellion in defence of the old faith, known as the Pilgrimage of Grace; York, Pontefract, and Hull being captured by the insurgents. In 1569 Yorkshire was the scene of another rising on behalf of Mary Queen of Scots. During the Civil War the county was mainly royalist. Bradford, Hull, Pontefract, and Scarborough were besieged, and the attempt of the royalists to raise the siege of York was frustrated by their crushing defeat at Marston Moor (July 2, 1644).

No part of England is richer in the remains of monastic houses, of which there were at the dissolution fifty-three abbeys and priories and twenty-eight friaries. The beautiful buildings of Rievaulx, Jervaulx, Fountains, Kirkstall, and Bylands are unequalled among the Cistercian houses not only of England, but of Europe. The three great Benedictine houses were Whitby, Selby, and St Mary's, York, the two latter being ruled over by mitred abbots. The magnificent pile which goes by the name of Beverley Minster was the church of a college of secular canons, as also were York Minster and Ripon Cathedral. Newburgh, Nostel, Bridlington, Guisborough, Bolton, and Kirkham were all Augustinian priories. The Priory of Mount Grace was Carthusian, Easby Abbey was Premonstratensian, and Malton Priory Gilbertine. Lastingham, where there is an ancient Saxon crypt, possesses great interest as being the seat of the early Irish Christianity introduced into Yorkshire by St Chad; while in the ancient crosses and inscriptions at Kirkdale church we have some of the oldest ecclesiastical remains in England.

Among the Yorkshire castles may be named those of Knaresborough and Pontefract, the old and interesting ruin of Conisborough, Richmond, with its fine Norman keep, Middleham, the residence of Warwick the king-maker, and Bolton, the prison of Mary Queen of Scots. Wressle Castle was once the seat of the Percies, and Gilling, which is still used as a residence, of the Fairfaxes.

Since the beginning of the 19th century the manufactures of Yorkshire have enormously developed. Leeds and Bradford are the centres of the woollen and worsted trades, while the cutlery of Sheffield is unrivalled. Of the numerous smelting and puddling furnaces the chief are those at Rotherham and Middlesborough. The agricultural portions of the county are well served by railways, while the manufacturing districts are covered with a network of lines; the chief towns being also connected by a system of canals, extending from sea to sea, and piercing the Pennine chain, at a height of 656 feet above the sea, by a tunnel three miles in length. Beyond the mining and manufacturing districts the population is agricultural, one of the principal industries being horse-breeding, for which Yorkshire is famous. Among the inland health-resorts Harrogate and Ilkley rank first, while the coast southward from Redcar and Saltburn is fringed with small watering-places, in addition to the larger towns of Whitby, Scarborough, Filey, Bridlington, Withernsea, and Hornsea.

Allen's *History of Yorkshire* and Baines's *Yorkshire Past and Present* are the only general histories, but are inadequate in scale and execution. Certain districts have been well treated, Poulson's *Holderness* and Hunter's *Hallamshire and South Yorkshire* deserving special commendation; Drake's *Eboracum*, Ormsby's *Diocesan History*, Lawton's *Collections*, Dixon's *Fasti Eboracences*, and Phillip's *Geology of Yorkshire* may be consulted, together with many less important works enumerated in Anderson's *English Topography*. See DIALECT; Rev. C. F. Morris, *Yorkshire Folk-talk* (1892), &c.

Yorkshire College. See LEEDS.

Yorktown, capital of York county, Virginia, on the York River, 10 miles from its mouth. Pop. 250. Here Lord Cornwallis surrendered to Washington in 1781; and here the Confederates, who had fortified the place, were besieged in 1862 by McClellan, and compelled to evacuate it.

York von Wartenburg, HANS DAVID LUDWIG (1759–1830), Prussian field-marshal and count, was the son of a Pomeranian, Captain von York (or Jarck), descended, according to the family tradition, from an English family that had settled during the Stewart troubles first in Sweden and then in Pomerania. Young York entered the army in 1772, was cashiered for insubordination, and served the Dutch in the East Indies, but returning to the Prussian service gained glory in the wars of 1794, 1806, and 1812. He was especially distinguished during the war of liberation and the invasion of France (1813–14). Ennobled in 1814, he was made a field-marshal in 1821.

Yoruba, or YARRIBA, a country of Guinea, West Africa, lying to the north-east of Dahomey, and between the British colony of Lagos and the Niger Company's territories. Its area is not perfectly definite; the population, some 2,000,000, are Soudanese Negroes, partly Mohammedanised.

Yosem'ité Valley is a cleft in the west slope of the Sierra Nevada, about the centre of California, and 140 miles E. of San Francisco. The name Yosemite is an Indian word which signifies 'large grizzly bear.' This celebrated valley, noted for the sublimity and beauty of its scenery, is about 6 miles long and from ½ to nearly 2 miles in breadth, and is traversed by the Merced River. The visitor is awed and impressed by the massiveness of its mountain elevations, the nearly perpendicular granite walls, from 3000 to 6000 feet high, by which it is shut in throughout its entire length, and the grandeur of its waterfalls, which are in some respects the most remarkable in the world. At the lower end of the valley stands the striking cliff known as El Capitan, 3300 feet high, while from near its lower corner the Virgin's Tears Fall descends 1000 feet. But the eye turns from it to the remarkable fall opposite, happily named the Bridal Veil, which leaps from the brow of a cliff 900 feet high, and descends in a broad sheet of spray and finally mist, swaying in the wind and constantly changing its form of fleecy beauty. Farther up the valley are Cathedral Rock (2660 feet), the Three Brothers (3830), Sentinel Rock (3043), and directly opposite it the grand Yosemite Falls; here the stream, 25 feet wide at the crest, takes a first leap of 1500 feet, then rushes 626 feet down in a series of cascades, and finally plunges 400 feet to the bottom. Above the falls are the North Dome (3568) and the vast Half Dome, nearly a mile (4737) high, whose summit can now be reached by a long climb. Two miles above the great falls the stream enters the main valley in two arms, coming out of two cañons. In that of the south fork is the Illilouet Fall, some 600 feet high; in the main cañon are Vernal Fall (400) and Nevada Fall (600), the latter one of the finest in the world. It is only, however, during the season of rains and melting snows that the valley can be seen at its best; in August and September the Virgin's Tears Fall disappears, the Bridal Veil shrinks almost to nothing, and even the Yosemite is reduced to comparative insignifi-

cance. The valley was discovered in 1851 by soldiers who pursued some predatory Indians to their fastness here; its fame quickly spread, and congress wisely took steps to preserve its beauties, and in 1864 handed it over to the state, along with the Mariposa grove of big trees (see SEQUOIA), to be held as inalienable for all time 'for public use, resort and recreation.' The State Park, consisting of the valley itself and a territory of two miles round it on all sides, is managed by a governor and state commissioners. The State Park is enclosed by the Yosemite National Park, which includes the basin of the river and all its tributaries. A dozen or so of the original inhabitants, the Digger or Shoshone Indians, still survive; they are about the least noble type of red man. There are hotels, a post-office, and a church in the valley, besides the houses of the guardian and the rangers and keepers under him.

See *The Yosemite Guide-book* (official); Bunnell, *Discovery of the Yosemite* (1893); William and Sara Wiley, *The Yosemite, Alaska, and the Yellowstone* (1893); and the reports on the national parks.

Youghal (pron. nearly *Yawl*), a seaport of County Cork, on the estuary of the Blackwater, 27 miles E. of Cork by rail. The town has some structures of interest—the parish church, which is formed of the nave and aisles of the ancient collegiate church, built by the Earl of Desmond in 1464; the 'water-gate' and the 'clock-gate;' and Sir Walter Raleigh's house, Myrtle Grove, which remains nearly in its original state. There is a handsome Roman Catholic church, and remains of several ancient conventual and other buildings. Parts of the old walls are standing. The trade of Youghal lies chiefly in the export of agricultural produce; the harbour is obstructed by a bar. According to local tradition, the potato was first planted at Youghal by Raleigh, who was mayor in 1588. The town sent a member to parliament till 1885. Pop. (1851) 7410; (1891) 4317.

Young, ARTHUR, writer on agriculture, was born on 11th September 1741 at Whitehall, but passed his boyhood, as indeed most of his life, at Bradfield Hall, near Bury St Edmunds, his father, Dr Young, being rector of Bradfield Combust and a prebendary of Canterbury. On quitting Lavenham grammar-school he was apprenticed in 1758 to a mercantile house at Lynn; but this 'most detestable situation' he left next year, upon his father's death, 'without education, pursuit, profession, or employment.' In 1763 he rented a small farm of his mother's, on which he made 3000 unsuccessful experiments; in 1765 married, not too happily, a sister of Fanny Burney's stepmother; during 1766–71 held a good-sized farm in Essex (ruin the result); from 1776 to 1778 was in Ireland; resumed farming at Bradfield; and in 1793 was appointed secretary to the newly-established Board of Agriculture, with a salary of £400. Blind from 1811, he died in London on 20th April 1820, and was buried at Bradfield. Arthur Young, by his writings, was one of the first to elevate agriculture to the dignity of a science, and render it popular among the upper classes of the country. Those writings, more than a score in number, include *A Six Weeks' Tour through the Southern Counties* (1768), *A Six Months' Tour through the North of England* (4 vols. 1771), *The Farmer's Tour through the East of England* (4 vols. 1770–71), *Tour in Ireland* (1780), *Travels in France during 1787–88–89–90* (2 vols. 1792–94), *The Farmer's Calendar* (1771; 21st ed. 1862), and 'Agricultural Surveys' of eight English counties, besides many papers in *The Annals of Agriculture*, which he edited, and to which George III. ('Farmer George') was a contributor. His works were as successful as his practice was unsuccessful.

The *Travels in France* is a valuable first-hand authority for the state of France in the revolution period; see the edition, with Life, by Miss Betham-Edwards (1890); Hutton's edition of the *Tour in Ireland* (with bibliography, 1892); Young's *Autobiography*, edited by Miss Betham-Edwards (1898); and Leslie Stephen's *Studies of a Biographer* (1898).

Young, BRIGHAM, American Mormon leader, was born at Whitingham, Vermont, June 1, 1801, and was the son of a small farmer proprietor. He received eleven days' schooling, and then was successively employed as carpenter, painter, and glazier in Mendon, New York. He first saw the 'Book of Mormon' in 1830, and in 1832, having become converted by Samuel H. Smith, a brother of the 'prophet,' he was baptised and began to preach near Mendon. Next he went to Kirtland, Ohio, was made an elder, and preached in Canada, 1832–33. In 1835 he was appointed one of the twelve apostles of the Church, in 1844 president; and the Mormons, when driven from Nauvoo, were after various wanderings led by him to Utah in 1847. In 1840 he had visited England, and as a result there were 2000 proselytes that year. In 1848 the great body of Mormons arrived at Utah, and founded Salt Lake City; and in 1851 Mr Fillmore, president of the United States, appointed Brigham Young governor (1851–58). In 1858 a new governor, Cumming, was appointed, and sent with a force of 2500 United States troops to protect him and the Federal officers; a compromise was effected, and the troops remained until 1860. The determination of the United States to abolish polygamy, and the appointment, in 1869, of a new United States governor, contributed somewhat to reduce Young's authority. In 1874 his fifteenth wife petitioned the United States courts for a divorce, and separated from him. Young encouraged agriculture and manufactures, made roads and bridges, carried through a contract for 100 miles of the Union Pacific Railroad, and was otherwise a friend to commercial progress. Practical and far-seeing, he had the faculty of accumulating wealth, although on one side of his character he appeared to be a fanatical enthusiast. Young died August 29, 1877, leaving a fortune of 2,500,000 dollars to seventeen wives and fifty-six children. See MORMONS, SALT LAKE CITY, and UTAH.

Young, CHARLES MAYNE, tragedian, was born on 10th January 1777, the second son of a clever but scoundrelly London surgeon. He spent a twelvemonth with an uncle at the Danish court (1786–87), was educated at Eton and Merchant Taylors, and, driven from home with his mother and two brothers, had for a while been a clerk in a West India house, when in 1798 he made his début at Liverpool. One hiss—his father's—was mingled with the applause that greeted his first appearance in London, in 1807, as 'Hamlet;' this, 'Iago,' and 'Falstaff' being perhaps his best characters. 'With his personal advantages and his d—d musical voice,' as Kean put it, he was a really original actor, second only, nay in some parts superior, to Kean himself. In 1829 he declined an offer of £12,000 for a ten months' tour in the United States, and in 1832 he retired with a fortune of £60,000. He died at Southwick, near Brighton, on 28th June 1856. In 1805 he had married a brilliant young actress, Julia Anne Grimani (1785–1806), who left him a son, the Rev. Julian Charles Young (1806–73). He was educated at Clapham, St Andrews, and Worcester College, Oxford; became rector of Southwick, Sussex (1844–50), and then of Ilmington, Worcestershire; and published a most amusing *Memoir of Charles Mayne Young* (2 vols. 1871), four-fifths of which is taken up with his own Journal, and which was supplemented in 1875 by *Last Leaves* from that same Journal.

Young, EDWARD, author of the *Night Thoughts*, was born at Upham rectory, Hampshire, in June 1681. Later his father rose to be dean of Salisbury and chaplain to William and Mary. He was educated at Winchester, entered New College, Oxford, in 1703, but after a few months migrated to Corpus Christi College, and in 1708 received a law fellowship in All Souls College from Archbishop Tenison. Here he seems not to have been righteous overmuch, to have passed, in Pope's words, 'a foolish youth, the sport of peers and poets.' Yet we are told he used to stand up to Tindal and more than hold his own in the struggle. He came before the world as a poet in 1712 with an *Epistle* to George Granville on being created Lord Lansdowne —a characteristic beginning for Young, who continued through life one of the most persevering and shameless toadies that ever flattered a patron or a king's mistress. His *Last Day* and *Force of Religion, or Vanquished Love*, followed in 1713; the poem on the *Death of Queen Anne*, written with one eye on her successor, the year after. In 1719 he ventured on the more ambitious effort of a tragedy, which, under the title of *Busiris*, was brought out at Drury Lane. Its inflated style was made fun of most happily by Fielding in his mock tragedy of *Tom Thumb*. About the end of 1716 Young seems to have been in Ireland in attendance on the hare-brained and dissolute young Marquis of Wharton (made duke in 1718). For some time also he resided in the family of the Marquis of Exeter as private tutor to Lord Burghley. But about 1719 we find him again in the train of Wharton, who gave him in 1721 a bond for £600 in consideration of his expenses in travelling and his losses in unsuccessfully contesting Cirencester. The duke seems to have entertained for him a real kindness, but the pious author of the *Night Thoughts* must have bowed low and often in the House of Rimmon to have retained it, as well as to have been a friend of that wretched reprobate Bubb Dodington, at whose seat at Eastbury in Dorsetshire he saw much of Voltaire in 1722. At Wharton's death in 1731 Young set forth certain claims against his estates, which he succeeded in making good to the extent of an annuity of £200. In 1721 was produced his tragedy *The Revenge*, which, though unsuccessful at the time, is still occasionally acted. The dedication to Wharton is a disgusting piece of flattery, which he could not but have known to be a lie. His third and last attempt in this field, *The Brothers*, was produced in 1753. Between 1725 and 1728 appeared in succession his satires, under the title of *The Love of Fame, the Universal Passion*. These had a great success, and brought to their fortunate author money as well as fame. Spence says Wharton alone gave him £2000. These satires show wit and talent, and even yet will repay perusal. For *The Instalment* (1726), a poem addressed to Sir Robert Walpole on his being made a Knight of the Garter, he was rewarded with a pension of £200. In 1727 Young took holy orders, and was appointed one of the royal chaplains; and in 1730 he became, by favour of his college, rector of Welwyn in Hertfordshire, a living worth £300 a year. The year after he married Lady Elizabeth Lee, the daughter of the Earl of Lichfield, and widow of Colonel Lee. He may be taken to have been happy with her, for out of his grief at her death (1741), together with that of her daughter and her daughter's husband, grew the *Night Thoughts* (1742-44), which, in spite of much fustian sublimity and artificial melancholy, bear the stamp of genuineness. He never received any further preferment in spite of his frequent complaints of being neglected, and he had not the honour to be the original of Parson Adams. His only son, a sensible young man, disliked the influence of his father's housekeeper, and for some years saw little of him. Young superintended in 1762 a collected edition of his works in 4 vols., from which he excluded certain of the most fulsome of his dedications. He died April 12, 1765.

Young's *Night Thoughts* has never since ceased to be popular, and many of its sententious lines have passed into common and almost proverbial use. Many passages show point and force, soaring sometimes into the region of real poetry; many more, however, degenerate into flat verbiage, or sink into profound and hopeless bathos. His besetting mannerism is antithesis and grandiloquence, a pair which hang but indifferently together. But indeed fatal faults throughout all his work are the lack of genuine human sympathy, and a constant and radical insincerity as a poetic artist.

See the edition, with a poor Life, by Dr Doran (2 vols. 1854). The best life is that in Johnson's *Lives of the Poets*, written by Herbert Croft, junior, in October 1782, and inserted by Johnson in his work. For a severe but justifiable enough attack on Young's character, see 'Worldliness and Other-Worldliness,' by George Eliot, in the *Westminster Review* for 1857, reprinted in her *Essays and Leaves from a Notebook* (1884).

Young, JAMES, of paraffin fame, was born in Glasgow, July 14, 1811. The son of a joiner and cabinet-maker, he learned his father's trade, but attended classes, especially in chemistry, at the Andersonian College and the Mechanics' Institution in the evening. He became assistant in Glasgow to Professor Graham in 1832, and in 1837 obtained a post in University College, London. As manager of chemical works near Liverpool (1839) and near Manchester (1843) he discovered cheaper methods of producing stannate of soda and chlorate of potash; and it was his experiments made between 1847 and 1850 which led to the manufacture of paraffin-oil and solid paraffin on a large scale (see PARAFFIN). A friend of Dr Livingstone, he sent out an expedition to Africa to find him. He endowed a chair of Technical Chemistry in the Andersonian College, and was made LL.D. by Glasgow University. He died May 13, 1883.

Young, ROBERT, LL.D., biblical scholar, born at Edinburgh, September 10, 1822, was bred a printer, superintended the Mission Press at Surat (1856-61), thereafter devoted himself to the preparation, the printing and publishing at Edinburgh, of a long series of meritorious books of somewhat narrow but remarkable biblical scholarship, working with unbroken industry down till his death, October 14, 1889. Among his books were an independent Translation of the Bible, *Marginal Readings* (10,000) *for the English Testament, Concise Critical Comments on the Holy Bible, Grammatical Analysis* of the Hebrew, Chaldee, and Greek Scriptures, *Hebrew Vocabulary*, and the laborious *Analytical Concordance to the Bible*, giving 311,000 references, &c.

Young, THOMAS, physicist, was born of Quaker parents at Milverton, Somersetshire, June 13, 1773, studied medicine at London, Edinburgh, Göttingen, and Cambridge, and started as doctor in London in 1800, but soon devoted himself to scientific research, and in 1801 became professor of Natural Philosophy to the Royal Institution. His *Course of Lectures* (1807) expounded the doctrine of Interference (q.v.), which established the undulatory theory of Light (q.v.). He was secretary to the Royal Society and to the Board of Longitudes, and did valuable work in insurance, hæmodynamics, and Egyptology (see HIEROGLYPHICS). He died May 10, 1829. See his Life by Peacock (1855).

Young England, the name applied, during the Corn-law struggle (1842–45), to a little band of young Tory politicians who wished to revive the

old kindly relations between rich and poor, master and man. Among its members were Lord John Manners (7th Duke of Rutland from 1888; born 1818), Mr Cochrane Baillie (Lord Lamington, 1816–90), the Hon. G. Smythe (Viscount Strangford, 1814–57), and Mr Disraeli (Earl of Beaconsfield, 1804–81), whose novels *Coningsby* and *Sybil* (1844–45) are an exposition of their principles.—'Young Ireland' was the name given to the Revolutionary party in Ireland in 1848, comprising W. Smith O'Brien (q.v.) and Gavan Duffy (q.v.; and see also O'Connell). The 'forward' though not necessarily revolutionary spirits in various countries are known in the same way as 'Young Italy,' 'Young Japan,' &c.

Young Men's Christian Associations were originally founded mainly for the spiritual and mental improvement of young men by means of devotional meetings, Bible classes, lectures, and libraries. It is on record that some London apprentices met, in 1632, at 5 A.M. on Sunday mornings for prayer and religious conversation. In 1678 a band of young men in connection with the Church of England met to 'apply themselves to good discourse and things whereby they might edify one another,' and did practical work amongst the poor, and amongst young men. There were thirty-two such societies in 1698. The societies for the Reformation of Manners were recruited mainly from these associations; and Methodism sprang from an association of godly young men at Oxford (1729). There were other young men's societies for missionary and other work previous to the founding of the London Y.M.C.A. in 1844, mainly through the exertions of Mr George Williams, of Hitchcock, Williams, & Co., of St Paul's Churchyard. Twelve young men met on 6th June 1844, in a room in St Paul's Churchyard, founded the 'Young Men's Christian Association' as a 'society for improving the spiritual condition of young men engaged in the drapery and other trades. In 1845 a course of lectures was begun, which, when published as 'Exeter Hall Lectures,' filled 20 volumes (1845–65). The movement took firm root in London and in the provinces. At the general conference of delegates from the associations of Europe and America, held in Paris in August 1855, a basis of alliance was agreed upon; and later conferences at Geneva (1858), in London (1862 and 1868), further aided the movement. Suitable buildings were secured in Aldersgate Street in 1855; and Exeter Hall was acquired in 1881 at a cost of £25,000, an additional sum of £30,000 being raised to adapt the building for use. Amongst the agencies in connection with this centre are fine gymnasiums; 109 classes, giving choice of a wide range of subjects, reading-room, conversation room, library, Bible classes, devotional meetings, tea and dining rooms; seaside homes, baths, employment and apartment register, &c. In 1892 there were 846 centres of work in the United Kingdom, with 83,817 members and associates, of which 504 were in England and Wales, 264 in Scotland, and 78 in Ireland. At the same date there were 3361 in Europe, 124 in Asia, 28 in Africa, 1440 in America, and 29 in Oceania, the total membership for the world being 418,972. Of this number there were 19 centres in Australia, 6 in New Zealand, 83 in Canada, 44 in India, 21 in Ceylon, and 24 in Cape Colony. In many of our home churches the Young Men's Christian Association is a branch of the Guild of Christian Workers, and is called a Young Men's Guild. Since 1851, when associations were formed in Montreal, New York, Boston, and Philadelphia, the movement has taken firm root in America, and there are splendid buildings in Brooklyn, New York, Philadelphia, and elsewhere, which, with their gymnasiums, libraries, reading-rooms, devotional meetings, and summer schools, are busy centres of Christian usefulness. It has developed lay activity, Mr D. L. Moody having begun his evangelistic efforts in the service of a young men's Christian association. The Christian Endeavour Associations, formed at Portland in 1881, had a membership of upwards of one and a half millions of young people in 1892, scattered over America, with branches in England, Australia, and Japan. This movement is entirely undenominational.

The Young Women's Christian Association, founded in 1857, has kindred aims in seeking the spiritual good, and the moral, social, and intellectual well-being of young women. In London alone there were, in 1892, 47 institutes, homes, and restaurants, over 100 smaller branches, and 17,000 members. The total membership was computed at 100,000—Scotland having 18,000. The work includes evening classes, gymnasiums, reading-rooms, holiday homes, circulating libraries, provident and emigration and total abstinence departments, as well as a Factory Helpers' Union, and Travellers' Aid Society for meeting girls at the London railway stations or at the docks. Several periodicals are issued in the interests of the association, which is undenominational.

The Girls' Friendly Society seeks to band together girls and young women for mutual help, religious and secular, and to encourage purity, thrift, and afford help in cases of sickness. There were over 1000 branches and a membership of 131,084 in 1892. Associates must belong to the Church of England, but there is no such restriction in regard to members. The work is carried on by means of classes, clubs, registry offices, homes. There is also a Scottish Girls' Friendly Society, wholly undenominational.

Youngstown, a manufacturing town of Ohio, on the Mahoning River, 67 miles by rail SE. of Cleveland and 66 NW. of Pittsburgh, with blast-furnaces, rolling-mills, manufactories of machinery, &c. Iron, coal, and limestone abound near by. Pop. (1880) 15,435; (1890) 33,220.

Ypres (Flemish *Yperen*), a Belgian town of West Flanders, on a fertile plain 30 miles SSW. of Bruges by rail, and 8 from the French frontier. Ypres was at one time one of the most important manufacturing towns in Flanders, the number of inhabitants in the 14th century being 200,000, and the number of looms 4000. Its staple manufacture was Diaper (q.v.). The only remnant of its once flourishing manufacture is the Cloth-hall (*Les Halles*), standing in the great market-place, in a rich style of Gothic architecture, and surmounted by a stately square tower or belfry, with a clock and chimes. It was built 1230–1342, and restored in 1860; a part was added in 1730. There are fine frescoes in the great hall, and many statues on the outside. One of the wings is now used as the *hôtel-de-ville*. The cathedral of St Martin is a fine Gothic edifice (1221–1350), with an altar of Carrara marble, a richly carved pulpit, and a picture doubtfully attributed to Van Eyck. The chief modern manufactures are thread and lace. Pop. 16,137. Ypres is a very old town, its origin dating from the 9th and 10th centuries. In 1688 it was strongly fortified by Louis XIV., and in the great European wars was frequently subject to sieges. Jansen (q.v.) was Bishop of Ypres.

Ypsilanti, a Fanariot family, claiming to be descended from the imperial stock of the Comneni. Alexander (1725–1805), a dragoman at the Porte, was raised to be hospodar of Wallachia, but put to death on suspicion of stirring up Greek ambitions.—His son Constantine became also hospodar both of Moldavia and of Wallachia. Deposed in 1805, he came back with some thousands of Russian soldiers, stirred up the Servians to rebellion, and made

another plan for restoring Greece. But he had to flee to Russia, and died in Kieff in 1816.—His eldest son, ALEXANDER (1783–1828), served with distinction in the Russian army in the campaigns of 1812 and 1813, and was chosen by the 'Hetairists,' a Greek secret society, as their chief in 1820. He headed a Rouman movement, but, defeated by the Turks, he was forced to take refuge in Austria. —His younger brother, DEMETRIUS, who was born 25th December 1793, also commenced his career in the Russian army, and joined his brother in his schemes for emancipating the Christian population of Turkey. In Greece he took part in the capture of Tripolitza (October 1820). His gallant defence of Argos stopped the victorious march of the Turks, and he stubbornly resisted (1825) the victorious Ibrahim at Napoli. In 1828 the grateful Hellenes made him commander-in-chief of their forces. He resigned in 1830, and died at Vienna, January 3, 1832.

Ypsilanti, a city of Michigan, on the Huron River, 30 miles by rail W. by S. of Detroit. It contains the state normal school, paper and woollen factories, flour-mills, canneries, &c. Pop. 6129.

Yriarte, CHARLES, a French author of Spanish ancestry, was born in Paris on 5th December 1832. He studied architecture, but from 1861 devoted himself to literature; his works, over twenty in number, dealing with Spain, Paris, the Franco-German war, Venice (Eng. trans. 1879), Florence (Eng. trans. 1882), Cæsar Borgia (1889), Isabella d'Este (1892), &c.; and he contributed the article BORGIA to this *Encyclopædia*. From 1894 he was inspector-general of fine art in France. He died 7th April 1898.

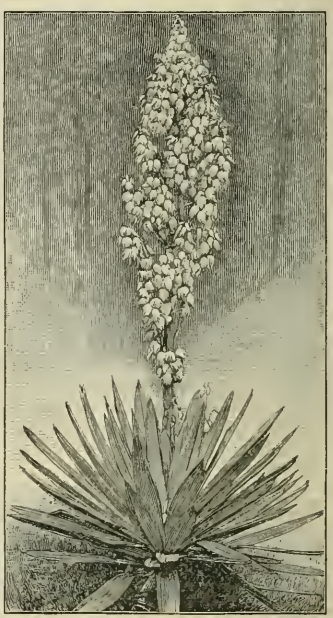
Ystradyfodwg, a township of Glamorgan, in the Rhondda valley, 19 miles NW. of Cardiff by rail, centre of a rich mining district. Pop. (1881) 55,632; (1891) 88,350.

Yttrium (sym. Y, atom. wt. 89), one of the rare metals, is contained in a few minerals in which there are usually also present compounds of one or more other rare metals such as cerium, didymium, erbium, and lanthanum. The minerals are Gadolinite, Yttrialite, Fergusonite, Cappelinite, Xenotime, Yttrotantalite, and one or two others. Gadolinite, which is largely silicate of yttria, contains from 36 to 46 per cent. of the oxide of yttrium, and occurs sparingly in Sweden, Norway, &c., but has of late been found in larger quantities in Texas. The metal yttrium has been obtained as a blackish-gray powder, but it has no very distinctive properties. The oxide yttria, Y_2O_3, is a yellowish-white powder. The hydrated oxide is thrown down by alkalies from solutions of the salts as a white gelatinous precipitate resembling alumina.

Yucatan, a Central American peninsula dividing the Gulf of Mexico from the Caribbean Sea, and bordering on British Honduras and Guatemala. It is a flat expanse, ridged only towards the east by a low chain of hills. The interior is overspread with forests of mahogany, rosewood, and other valuable timber, while the south and east teem with maize, pulse, rice, tobacco, indigo, coffee, the *henequen*, or Sisal hemp plant. Ruins of Uxmal, Chichen, Izamal, Mayapan, &c., consisting of temples and other vast edifices, richly carved and coloured, and of unknown history and meaning, testify to an ancient civilisation. Made known to Europe in 1517, and completely conquered in 1541, this part of New Spain (granted in 1783 to English logwood-cutters for a time; see DESPARD) continued under Spanish domination till 1821. After repeated short periods of independence it has since 1852 belonged to Mexico, as a single state till 1858, as two states, Yucatan and Campeachy, since that date. The state of Yucatan, the north-east part of the peninsula, has an area of 28,178 sq. m. and a pop., mostly Maya Indians, of 275,506. The capital is Merida (q.v.).

See historical works by Cogolludo (1687), Sotomayor (1701), and Baqueiro (1868); Charnay, *Ancient Cities of the New World* (trans. 1887), Le Plongeon, *Yucatan: its Ancient Places and Modern Cities* (Brooklyn, 1889).

Yucca, a genus of plants of the natural order Liliaceæ, natives of the United States, Mexico, and Central America, some of which are often cultivated in gardens on account of the singularity and splendour of their appearance. *Y. gloriosa* is a native of Virginia and the countries to the south of it, but is quite hardy in England, so as to sometimes flower luxuriantly in the open air. It has a stem about 2 or 3 feet high, the upper part of which produces a great tuft or crown of large sword-shaped evergreen leaves, each terminating in a sharp black spine. From the centre of this crown of leaves arises the flower-stalk, of 3 feet or upwards in height, branching out on every side so as to form a great panicle. The flowers are white with a purple stripe. The other species, of which there are some twenty, have a general resemblance to this in habit and appearance. Some of them reach a height of 50 feet, with a stem 5 feet thick. The *Y. filifera* or *Y. vaccata* is called Spanish Bayonet or Mexican Banana, and yields an edible fruit. The fibre of the Yuccas is similar to that of the Agaves and Bromelias, and is used for coarse cloth and cordage.



Yucca gloriosa superba.
(From a Photograph taken in the open air near Edinburgh in 1890.)

Yukon, the great river of Alaska (q.v.), is formed by the junction of the Lewis and Pelly at Fort Selkirk, in British territory (62° 45′ N. lat.), and flows westward across the territory of Alaska into Behring Sea. Its length is some 2000 miles; in its lower course it is more than 20 miles wide, and for 400 miles from 1 to 4 miles wide. It is navigable by steamers for 1840 miles. But the deposits of mud and silt have formed a great delta which prevents vessels at sea from approaching within 60 miles of its many mouths. Part of the year its waters swarm with salmon, some of 120 lb. At the mouth, where the river is known as Kwikpak, is Fort St Michael; Nuklukahyet, 800 miles up, is a more important place. Since 1895 the river gives name to a territory of the Canadian northwest, north of British Columbia; gold is found there. In 1897 there was a 'gold rush' to the Klondyke (q.v.), within the Yukon basin.

Yule, the old name for Christmas, still used provincially, as well as in Yule-log, Yule-cake, Yuletide. For the nature of the old heathen festival,

and the way in which the observances were overlaid or transformed by the Christian institution, see CHRISTMAS. The word is not connected with Ice. *hjōl*, 'wheel,' nor yet with *yawl* or *yowl*, 'to howl' or 'cry.' The Anglo-Saxon form is *geól*, cognate with the Ice. *jól*.

Yule, SIR HENRY, Orientalist, was born at Inveresk near Edinburgh in May 1820. His father was a major in the Company's army, and after passing through Addiscombe he himself received a cadetship in the Bengal Engineers (1840). He served successively on the north-east frontiers, on the great irrigation works in the North-western Provinces, in surveys on the mountains between Arakan and Burma, as secretary to Sir Arthur Phayre's mission to Ava in 1855, and during the Mutiny in maintaining the railway communication up the Ganges valley. He was Secretary to Government in the Public Works department from 1858 till 1862, when he retired with the rank of colonel, and the year after was gazetted C.B. (civil). He lived some time at Palermo, sat on the Indian Council from 1875 until 1889, was made K.C.S.I. on his retirement, and died in London, December 30, 1889. He had received the LL.D. degree from Edinburgh in 1884, and was a corresponding member of the French Institute. He had been president also of the Hakluyt Society and of the Royal Asiatic Society. His articles in the *Journals* of the Geographical and Asiatic Societies were numerous, and he wrote valuable Introductions for Wood's *Source of the Oxus* (1872), Delmar Morgan's translation of Prejevalsky's *Mongolia* (1876), and Gill's *River of Golden Sand* (1880). His *Cathay and the Way Thither* (Hakluyt Society, 2 vols. 1866) was a collection of all the minor notices of China before the 16th century, and prepared the way for his magistral work, *The Book of Ser Marco Polo the Venetian* (2 vols. 1871; 2d ed. 1875). His next great work was the *Anglo-Indian Glossary* (1886), perhaps better known under its alternative title of *Hobson-Jobson*, with the collaboration of the philologist Dr Burnell, who died in 1882. His last work was the exhaustive notes (Hakluyt Society, 2 vols. 1888–89) contributed to the Society's reprint (1887) of the MS. Diary (1681) of William Hedges.

Yunnan, a province in the south-west of China, bounded on the S. by Annam, Siam, and Burma, with an area estimated at 122,000 sq. m., and a population, put by Mr Colquhoun at 4,000,000, having sunk from 15,000,000 through plague and the war of the Mohammedan Panthays which smouldered from 1855 till 1872. The surface is mainly an extensive uneven highland plateau, in which the main ranges trend north and south. Between these ranges, which vary in height from 12,000 to 17,000 feet in the north to 7000 or 8000 in the south, are numerous deep defiles through which run some of the largest rivers of Indo-China —the Mekhong or Cambodia, the Salween, and the Shwéli. Fertile plains and valleys are numerous. In the northern part the surface is wild, broken, and barren, wrapped in mist and fog, and the population sparse. But the south and south-west are populous and richly cultivated. Except in the cities the mass of the people is made up of aboriginal tribes, such as the Lolo, Pai, and Maiao. In the plains rice, maize, peas, beans, opium, tobacco, and sugar are the chief products—about a third of the whole cultivated area being given to the poppy. Almost the only import is cotton from the Shan states, but some British piece-goods reach the province from Canton. There is much mineral wealth as yet little wrought. The main routes available for tapping the wealth of Yunnan are (1) by the Yang-tsze River, from Shanghai; (2) by the Canton River, from Canton; (3) by the Songka River, from the Tongking gulf; (4) by the Bhamo route, from Bhamo on the Irawadi; (5) by some route from British Burma. Mr Colquhoun's judgment is that the last is the best—by railway from the side of Burma. The first important exploration was that of the French (1867–68). Later were Cooper in 1868, Dupuis in 1869–70, Margary (murdered 22d February 1875 at Manwyne, the last town on the Chinese border), Grosvenor and Baber in 1876, McCarthy and Captain Gill in 1879, Count Szechenyi in 1880, Colquhoun in 1881. See *Across Chrysê* (1883) by the last.

Yuruari. See VENEZUELA.

Yuste. See CHARLES V.

Yúsufzáis. See AFGHANISTAN.

Yverdon (also spelt *Yverdun*), a pleasant Swiss town of 6300 inhabitants in the Canton de Vaud, at the southern end of the Lake of Neuchâtel, 20 miles N. of Lausanne by rail. The old castle, built in 1135, was used by Pestalozzi (q.v.) as an educational institute; and is now occupied by municipal schools, a library, and museum. There is a sulphur-bath less than a mile out of the town.

Yvetot, an old town of France, in the dept. of Seine-Inférieure, 24 miles NW. of Rouen by rail. There are manufactures of linen, cotton, calico, and a trade in cattle and agricultural produce. The court and gaol occupy the site of a Bernardine monastery (1650–1781). Pop. 7007. The town and territory of Yvetot was long a semi-sovereign principality, and the Lord of Yvetot was popularly styled 'Roi d'Yvetot.' This singular dignity was formally abrogated in 1681, but the people of Yvetot retained some privileges till the Revolution. Beranger's well-known song, *Le Roi d'Yvetot* (1812), translated by Thackeray, was a satire on Napoleon. See a history by Beaucousin (1884).

Z

the last letter in our alphabet, is derived, through the Greek *zeta*, from *zayin*, the seventh Semitic letter. The Semitic form was Ⅱ, which is also the Greek lapidary and numismatic form. But though in form and station *zeta* corresponds to *zayin*, yet through some confusion *san* acquired the name of *zayin* (*ds*), and *zeta* that of *tsade* (*ts*). In the old Italic abecedaria the letter Z occupies, like *zeta*, the seventh place, and the letter survived in Oscan, Umbrian, and Etruscan; but, as the sound did not exist in Latin, the letter was discarded, not later than the 3d century B.C., when its alphabetic station was usurped by the new letter G (see 'G'). In the 1st century B.C. it was reintroduced from Greece in the uncial form Z, in order to transliterate Greek words. Together with the symbol, the name *zed* was borrowed from that of the Greek *zeta*, whereas if the letter had been continuously retained in the Latin alphabet the name, following the analogy of the other Latin letters, would have been *ez*. It is curious that *zed*, the only Semitic letter-name that we retain, should have belonged originally to a Phœnician letter which has disappeared from every European alphabet. It can hardly be said that *z* was an Anglo-Saxon letter, as it is only used in biblical names, such as Zaccheus; even now it appears in very few native English words, the sound, when we have it, being usually represented by *s*, as in the words 'Wednesday,' 'thousand,' 'tongs,' 'weeds,' 'tease,' 'cheese,' 'knees,' 'these,' 'his' and 'is.' We use it chiefly for words of Greek, Hebrew, and Arabic origin, such as 'zoology,' 'zephyr,' 'zeal,' 'zany,' 'Zedekiah,' 'Zebulon,' 'azure,' 'zenith,' 'magazine,' 'gauze,' 'zero,' 'zodiac,' or 'gazelle.' Owing to French influence it has taken the place of *s* in a few English words, such as 'dizzy,' 'frozen,' 'hazel,' 'squeeze,' and 'sneeze;' and it represents a French *s* in 'hazard,' 'lizard,' and 'buzzard.' It is intrusive in 'citizen,' from the French *citoyen*. The sound of our *z* is a voiced sibilant, either a voiced *s* as in 'zeal,' or a voiced *sh* as in 'azure,' French sounds which we borrowed. The value in Latin and Greek is doubtful: probably it was either *dz* or *zd*. By Grimm's law a German *z* answers to an English *t* and a Latin *d*, as in the words *zwei, two, duo;* or *zahn, tooth, dens*. The cedilla (ç) is a 'little *zed*,' as is implied by the Italian name *zediglia*, from *zeticula*.

Zaandam, a town in the province of North Holland, on the Zaan, at its entrance into the Y, 5 miles NW. of Amsterdam by rail. Many of its wooden houses, mostly painted white or green, are separated by canals, and with their gardens round them look like little islands. It has many corn, oil, and saw mills, in whose products an active trade is maintained with the Baltic, Black, and White Seas; and also active manufactures of paper, dyes, starch, tobacco, and glue, and still a little shipbuilding. Most of the sixty wharves it had in the 17th century have disappeared, and its famous whale-fishery is also a thing of the past. Here in 1697 Peter the Great worked in one of the shipbuilding-yards as a carpenter, and the hut in which he lived is carefully preserved. It was visited in 1814 by the Czar Alexander. Pop. (1888) 14,545.

Zabern (Fr. *Saverne*), a town of Lower Alsace, 22 miles NW. of Strasburg by rail, once residence of the bishops of Strasburg. Pop. 6605.

Zabism. Under the name Zabians used to be grouped several peoples distinct in origin and by no means alike in religion. The mediæval Arabic, Jewish, and Persian writers, all starting from the notion that idolatry, star-worship, and *Sabæism* were identical, called nearly all those heathens or Sabæans who were neither Jews or Christians, nor Mohammedans or Magians. Now the name Sabæans (q.v.) denotes strictly the ancient inhabitants of southern Arabia, who were but little modified by Babylonian influences; the Zabians of the Koran were originally non-Christian Gnostics—the ancestors of the still existing Mandæans (q.v.) or Joannes' Christians. Again there were Pseudo-Zabians, or Syrian Zabians (in Haurân, Edessa, Bagdad), remnants of the ancient Syrian but Hellenised heathens, from about the 9th till the 12th century. They themselves derived their denomination from one Zâbî, variously called a son of Seth, of Adam, of Enoch or Idris, of Methuselah, or of some fictitious Badi or Mari, a supposed companion of Abraham. The name, however, was not native, but assumed, in order to evade Mohammedan persecution, from the people mentioned in the Koran. They were simply heathens who had to a certain extent adopted and modified Neoplatonist ideas, such as floated in the mental atmosphere of the early Christian centuries. These Zabians did not disappear before they had produced a host of men eminent in every branch of learning and literature, in philosophy, astronomy, history, natural history, poetry, medicine, and the rest. The Mohammedans had a high appreciation of Zabian learning, and explained it by tracing it to a supernatural source, notably to Hermes (Trismegistus), the father of the Zâbî mentioned above. The first to clear up the confusion about this people was Chwolson, in his masterly work, *Die Ssabier und der Ssabismus* (2 vols. St Petersburg, 1856).

Zacate'cas, capital of a state of that name in Mexico (q.v.), and a famous silver-mining town, is situated in a deep ravine, 440 miles by rail NW. of Mexico city. The streets are narrow and irregular, but there are numerous squares, and the market-place, where the cathedral stands, is wide and handsome. Three miles to the east is the Franciscan college where the fathers of the old Californian missions were trained. Zacatecas is the great silver-producing state of Mexico, and around the city 15,000 men are employed in the mines, which since 1540 have yielded over $1,000,000,000. Pop. of municipality, some 60,000, less than one-half in the city.

Zacharias, pope from 741 to 752, was a Greek by birth. He gave his consent to the setting aside of the Merovingian Childeric III. and the elevation to the throne of Pepin the Short (752). He

died at Rome, 14th March 752. See books by D. Bartolini (1879) and I. Cozza-Luzi (1880).

Zadkiel, the name assumed by Richard James Morrison, the compiler of an astrological almanac, which was started by him in 1830, and which reached a yearly sale of from 100,000 to 200,000 copies. He was a retired commander in the royal navy, a Hebraist, mathematician, and astronomer, withal a real believer in his pseudo-science, as was brought out in his action for libel against Sir E. Belcher (1863). He was born about 1794, and died on 5th February 1874. See CRYSTALLOMANCY.

Zadonsk, a Russian town on the Don, 70 miles N. of Voronej, is the seat of a celebrated monastery. Pop. 9800.

Zadruga. See SERVIA, p. 326.

Zafarâni Islands, three islets off the north coast of Morocco, occupied by Spain. Pop. 703.

Zaffre. See COBALT.

Zagazig, a town of the Egyptian delta, capital of a district and an important railway centre, 50 miles NE. of Cairo, on a branch of the Sweetwater Canal connecting Ismailia with the Nile. It was occupied by the British troops immediately after the battle of Tel-el-Kebir. Pop. 19,046.

Zahn, THEODOR, a biblical scholar of unrivalled acuteness and learning, was born at Mörs in Rhenish Prussia, October 10, 1838; studied at Basel, Erlangen, and Berlin (1854–58); became *Repetent* at Göttingen in 1865, *privat-docent* in 1868, and professor extra-ordinary of Theology in 1871; and obeyed calls to Kiel in 1877, to Erlangen in 1878, to Leipzig in 1888, and back to Erlangen in 1891. Of his writings the most important are *Marcellus von Ancyra* (1867), *Der Hirt des Hermas* (1868), *Ignatius von Antiochien* (1873), *Acta Joannis* (1880), and *Cyprian von Antiochien und die Deutsche Faustsage* (1882), which worthily prepared the way for those splendid comprehensive works devoted to the New Testament Canon which have placed him first amongst the scholars of his time—*Forschungen zur Geschichte des Neutestamentlichen Kanons* (4 vols. 1881–91), including *Tatian's Diatessaron*, &c.; and the *Geschichte des Neutestamentlichen Kanons* (vols. i.–ii. 1889–91). Together with Gebhardt and Harnack he edited the *Patrum Apostolicorum Opera* (3 vols. 1876–78).

Zähringen, a small village a mile N. of Freiburg in Breisgau, historically noteworthy for the ruined castle of the dukes of Zähringen, the ancestors of the reigning House of Baden (q.v.).

Zaire. See CONGO.

Zaleucus, the legendary lawgiver (*c.* 750 B.C.) to the Epizephyrian Locrians, the Locrians who colonised the SW. extremity of Italy.

Zama, a city and fortress in Numidia, about 100 miles SW. of Carthage, near which Hannibal (q.v.) was defeated by the Younger Scipio, 201 B.C.

Zambesi, Vasco da Gama's 'River of Good Signs,' which ranks with the Congo and the Nile as a means of communication with the interior of Africa. A highway for the nations of the world, the river, which is between 1550 and 1600 miles long, is an important factor in the development of South Africa. Immediately after its rise in the marshy country to the west of Bangweolo it passes through Lake Dilolo at the extreme south-west point of the Congo Free State, about 22° 20′ E. long. and 11° 40′ S. lat. On its way to the Indian Ocean the Zambesi drains more than half a million square miles of territory. It receives many tributaries, notably the Loamba, Kafue, Loangwa, and Shire, by which last named the British lake country and Equatorial Africa are approached from the south. For about two-thirds of its length from the source the Zambesi flows through British protected territory, entering the Portuguese possessions near Zumbo. Owing to many cataracts, narrows, and rapids, navigation is only clear for stretches of 100 or 200 miles. Small steamers may go from the mouth as far as the Kebrabassa Falls. Above that point the river, which has a very noble aspect at some parts, is navigable with occasional interruptions till the Victoria Falls are reached, 900 miles from the sea. These falls, as great and grand as those of Niagara, were discovered and named in 1855 by Dr Livingstone; the native name being Mosioatunya or, at an earlier date, Shongwe. The river, which is here 1000 yards broad, drops sheer into a huge fissure in the earth's surface nearly 400 feet deep. Beyond this for 700 miles the river forms a partial waterway to the interior. The delta of the Zambesi comprises an area of 2500 sq. m., and it has a number of months all more or less blocked with sand. Those named the Chinde and Kongoni are used for entering the Zambesi. The former has a length of 18 miles from the sea to its junction with the great river. Sena, an important town, 130 miles from the ocean, is on the south bank of the Zambesi; and Tete, 190 miles farther, near the Kebrabassa Falls, is a trading centre for gold and ivory. Zumbo, another trading station, is 550 miles from the sea. Two British gunboats are now placed on the Zambesi.

Zambesia, that portion of the territory watered by the river Zambesi which is now under British protection. It is also becoming generally accepted as a loose definition of the country under the sway of the British South Africa Company. South Zambesia (southwards of the river) embraces Mashonaland (q.v.), Matabeleland (q.v.), a part of Manica, and the country of Khama, the Christian chief of the Bamangwatos. North Zambesia (northwards of the river) extends to Katanga, Lake Tanganyika, and its eastern boundary is the western shore of Lake Nyassa. The Shire Highlands are also within its limits. A royal charter was granted to the British South Africa Company in October 1889. Its first clause describes the principal field of the operations of the company to be the region 'lying immediately to the north of British Bechuanaland, and to the north and west of the South African Republic, and to the west of the Portuguese dominions.' The company was formed with the Dukes of Abercorn and of Fife for president and vice-president, and the Hon. Cecil J. Rhodes (q.v.), Premier of the Cape Colony, for managing director. The land which the company now governs was till recently almost a sealed book to all but the most adventurous of sportsmen, and missionaries like Moffat and Livingstone. Bulawayo, Salisbury, Victoria, and Umtali, already thriving centres of population, are now connected by Palapye and Mafeking with the telegraph system of Cape Colony. The railway from Vryburg to Bulawayo was opened in 1897, that from Beira on the Pungwe to Salisbury in 1899. But the mineral and agricultural development has been seriously retarded by the Matabele war, a terrible epidemic of rinderpest, the Jameson raid, and the Transvaal war of 1899–1901. Rhodesia (see RHODES, CECIL), North and South, is practically Zambesia without the British Central Africa protectorate. A new constitution was promulgated in 1898; there is now a resident commissioner in southern Rhodesia appointed by the Secretary of State, and executive and legislative councils.

See Mather, *Zambesia* (1891); Knight, *Rhodesia of To-day* (1893); Purvis and Biggs, *South Africa* (1896); also the articles AFRICA, CAPE COLONY, MATABELE, JAMESON (L. S.), NYASSALAND, and books there cited.

Zamia. See CYCADS.

Zamora, a very ancient town of Spain, capital of a province, is on the Douro, 150 miles NW. of Madrid by rail. It is the see of a bishop suffragan of Santiago. Zamora was of great importance in the Moorish times, was strongly fortified, and has many interesting remains of mediæval architecture. The cathedral is a late Romanesque edifice. There are some linen and woollen manufactures. It has never recovered the devastations of the French (1808–9). Pop. 15,209.

Zamosc, a fortified town of Russian Poland, 154 miles SE. of Warsaw. Pop. 7725.

Zanella, Giacomo (1820–88), Italian poet, was born at Chiampo, entered the priesthood, and in 1866 was placed in the chair of Italian Literature at Padua. He was remarkable as a lyrist.

Zanesville, capital of Muskingum county, Ohio, on the Muskingum River at the mouth of the Licking, 67 miles by rail E. of Columbus. The river is navigable for steamboats to this point, and is crossed by an iron railway bridge 538 feet long, and by several others to its suburbs, Putnam and West Zanesville. It has rich coal-mines close by, and manufactures extensively engines and boilers, flour, iron, cottons and woollens, glass, paper, tiles, &c. Pop. (1880) 18,113; (1890) 21,009.

Zanguebar. See Zanzibar.

Zangwill, Israel, born of Jewish family in London in 1864, was mainly self-taught, but graduated with honours at London University, and, after some experience in teaching, became an active journalist. He has written poems, plays, novels, and essays, and became widely known by his tales of Jewish life—*Children of the Ghetto* (1892) and *Ghetto Tragedies* (1894), and *The King of Schnorrers* (1894). Other works are *The Master* (1895), *Without Prejudice* (republished essays, 1896), and *A Nineteenth Century Miracle* (1897).

Zante (anc. *Zacynthos*), one of the principal Ionian Islands, 9 miles from the north-west coast of the Morea, and 8 south of Cephalonia, is about 24 miles long, 12 broad, and has a pop. of 45,522. In the west it attains a maximum altitude of 2486 feet; the centre is fertile, formed by depression, and is mainly devoted to the growing of the dwarf species of vine, originally brought from Corinth, from which *currants* are produced. Zante is mentioned in Homer with the epithet 'woody,' which is not apt at the present day, although it is justly called in an Italian proverb 'the flower of the Levant.' It is not volcanic, although thought to be so by the natives from the pitch-wells and the not infrequent earthquakes. Currants are largely exported, mostly to England, where, according to Lithgow the traveller, they were first introduced from Zante about 1550.—Zante, the capital, the largest town in the Ionian Islands, is situated at the head of a small bay on the east coast. Pop. 17,000. See Ionian Islands.

Zanzibar, a British Protectorate under a native sultan, consisting of the African islands of Zanzibar and Pemba. With the British East Africa Protectorate (the territory of the I. B. E. A. Company, dissolved in 1896) and the Uganda Protectorate, it constitutes British East Africa. As delimited in 1886, the kingdom comprised the islands of Zanzibar (625 sq. m.), Pemba (360), Mafia (200), and Lamu (35), and a strip of coast, extending 10 miles inland, from Cape Delgado to Kipini. In 1888, however, the German East African Association acquired the right to administer the mainland portion from the Umbu River southward, and the British East Africa Company obtained all the coast northward, for an annual payment. In 1890 the British portion was extended to the mouth of the Juba (q.v.), and the islands were made a British protectorate; at the same time Germany bought its portion of the mainland outright for four million marks. Zanzibar Island (*Unguja*), separated from the mainland by a deep channel, rests upon a coral foundation, and rises in the interior to 425 feet. The hills bear oranges, cloves, &c., and on the plains rice, manioc, sugar-cane, sorghum, &c. are grown. Of a total population of some 125,000 nearly 100,000 are in the town; the people are mostly negroes, but the governing class are Arabs, and many foreign traders are settled in the capital —about 100 British, many Germans and French, several hundred from Goa, &c. The religion is Mohammedanism, but a number of Christian missions have been established, both here and on the mainland. The capital, situated on an island-studded bay on the west side of the island, is the only large town and trading-port on the east coast of Africa; it is a station of the British India Steam Navigation Company, and of the Messageries Maritimes, and numerous craft flying the French flag trade to Madagascar. The imports (about a third from Bombay) average £1,300,000—cottons, coal, hardware, kerosene, soap, rice, flour, &c., and products from German East Africa; the exports of African products sent abroad and of European goods distributed along the coast are returned at £1,350,000, but this excludes goods transhipped in the harbour, and moreover no trustworthy record is made of the dhow trade. In African produce passing through Zanzibar ivory takes the first place; next follow rubber, hides, copal, tortoise-shell, wax, cloves, archil, &c. The sultan's privy purse is fixed at three lakhs of rupees, derived mainly from customs dues, &c.; the balance of the state's income is applied for police, public works, and the like. The police, along with the army of 700 men, are under a British officer. The prime-minister is English. Most civil causes are tried in the English Consular Court, with appeal to Bombay. In 1892 Zanzibar was declared a free port. The legal status of slavery was abolished in 1897, not without complications and complaints in parliament.

Zanzibar means 'land of the Zenj,' a reigning dynasty, probably of Swahili origin, who ruled a somewhat indefinite area of the African coast regions. Ultimately *Zanguebar* was the term usually given to the continental portion as distinguished from the island. There were Arab settlements in various places as early as the 10th century. By the end of the 15th century the Portuguese made their influence felt, and in 1503 were recognised by the Mohammedans on the island as paramount. In the 17th century the Portuguese lost most of their dominions north of Mozambique to the imam of Muscat, and many small states were founded. About 1856 Seyid Medjid, a son of the imam of Muscat, became practically independent sultan of Zanzibar, and consolidated a considerable state, which in 1870 descended, gradually dwindling, to his brother Bargash, in 1888 to another brother Khalifah, and in 1890 to still another, Sayyid Ali.

See Stanley's and Joseph Thomson's books; Burton, *Zanzibar City, Island, and Coast* (1872); Rabaud, *Zanzibar* (Marseilles, 1881); K. W. Schmidt's *Sansibar* (Leip. 1887); and Silva White's *Development of Africa* (1890); also the articles Uganda, Witu.

Zápolya. See Hungary, Vol. VI. p. 6.

Zaporogians. See Cossacks.

Zara (Slav. *Zadar*), capital of Dalmatia, on the coast of the Adriatic, 130 miles SE. of Trieste. It is built on a narrow promontory, separated from the mainland by a moat. There is a spacious and well protected harbour, and till 1873 the place was strongly fortified. Of its churches the most note-

worthy are its archiepiscopal cathedral (1205), founded by Henry Dandolo, Doge of Venice, and the church of the patron saint, St Simeon. A lofty marble column is all that is left standing of an ancient Roman temple; there are also the remains of a Roman aqueduct. The chief manufactures are the making of glass and of maraschino and rosoglio. Pop. 11,861, mainly Italians.

Zarafshan. See BOKHARA.

Zaragoza. See SARAGOSSA.

Zarncke, FRIEDRICH, Germanist, was born at Zahrenstorf near Brüel in Mecklenburg-Schwerin, 7th July 1825. He studied at Leipzig and Berlin, settled at Leipzig in 1850, founded the *Litterarisches Zentralblatt für Deutschland*, and became in 1858 ordinary professor of German Language and Literature at the university there. Here he died, 15th October 1891. His writings include a treatise on the German *Cato* (1852); an edition of Brant's *Narrenschiff* (1854); treatises on the *Nibelungenlied* (1857), and many contributions to a knowledge of such mediæval German writings as the Old Saxon *Hêliand*, the O. H. Ger. *Muspilli* and *Georgslied*, &c., in the *Abhandlungen* of the Saxon Academy of Sciences, and elsewhere; mediæval poetical proverbs (1863–65); the history of Leipzig university (1857), and the mediæval German universities (1857); and Prester John (in various dissertations, 1876–79 *et seq.*). Other works were a study of Christian Reuter (1884) and his *Kurtzgefasstes Verzeichniss der Originalaufnahmen von Goethes Bildniss* (1888).

Zarskoe. See TSARSKOYE SELO.

Zaruma, a town of Ecuador, on the west slope of the Andes, 95 miles S. of Guayaquil. It has gold and quicksilver mines, and grows cane and fruits for sugar. Pop. 6000.

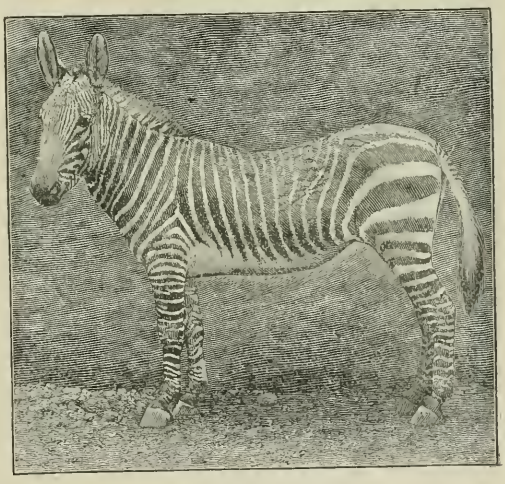
Zea. See CEOS; and for the grain, see MAIZE.

Zealand (Dutch *Zeeland*), a province of the Netherlands, consists of portions of Flanders (East and West) and of the islands Walcheren, North Beveland, South Beveland, Schouwen, Duiveland, and Tholen, with an area of 690 sq. m. and a pop. (1897) of 213,618, about three-fourths Protestants. The provincial capital is Middelburg: Flushing is also in Walcheren. The greatest part of the soil, which is a rich clay, has been redeemed from the sea; and the number of Polders (q.v.), or drained districts, is about 400. The neighbouring seas abound with fish, and in Schouwen many eggs are collected, myriads of water-fowl resorting thither to form their nests. In 1866 a ship-canal through the island of South Beveland was made to take the place of the Easter Scheldt. Hence came the name of New Zealand (q.v.).

Zealand (Dan. *Sjælland*), the largest and most important island of Denmark, lies between the Cattegat and the Baltic, and is separated by the Sound from Sweden and by the Great Belt from Fünen. Length, 81 miles; extreme breadth, 67 miles; area, 2670 sq. m.; pop. (including the small islands of Möen, Samsö, &c.) 821,703. The surface is nearly everywhere flat, except in the northern peninsulas; the coasts, which are rockbound on the south-east, are indented by bays and fiords, the chief of which is the Roeskilde-Isefiord in the north. The rivers are small, but there are numerous lakes, and all the waters abound in fish. The island contains several beech-forests, is exceedingly fruitful in corn (particularly barley and rye), and breeds excellent horses and cattle. Agriculture and cattle-breeding are the principal employments of the inhabitants. The chief place is Copenhagen (q.v.), on the east coast; the next in rank and size are Elsinore in the north and Korsör in the south-west.

Zebid, an Arabian town in Yemen, on the inland route from Hodeida to Mocha, from which last it is 60 miles north. Once famed for its commerce and its learning, and the seat of a long line of princes, it has now but some 7000 inhabitants.

Zebra, a generic name given to the group of striped Equidæ—all of which are peculiar to the African continent—and thus including the Dauw or Burchell's Zebra (*Equus burchelli*) and its variety *Equus chapmani*, a species inhabiting the plains of the interior, the Quagga (q.v.), and the true or Mountain Zebra (*Equus Zebra*). The type of the entire group is more asinine than equine, and in the true zebra the ass-like character is heightened by the longer and fuller ears and the barer tail—the latter furnished only with long hairs towards the tip, the tail of the quagga and Burchell's zebra being equine and flowing. In all the hind-legs are without warts. The true or Mountain Zebra, *Equus* or *Asinus Zebra*, the *Wilde Paard* (wild horse) of the Cape Dutch, stands about 12 hands high at the shoulder, and is of a strong and muscular yet beautifully symmetric form. The body colour is of a silver white, and the black markings, which are fuller and more even than in the other members of the group, extend to every part of the body except the stomach and inner part of the thighs. Even the legs are closely ribboned in black and white down to the hoofs. Upon the light, clean head (with the exception of the ears, upon which the black and white markings continue) the markings change to brown, while the muzzle is of a rich bay tan. The mane is hogged and upstanding, but somewhat less shaggy than in Burchell's zebra. The legs are short, clean, and wiry, yet well proportioned to the

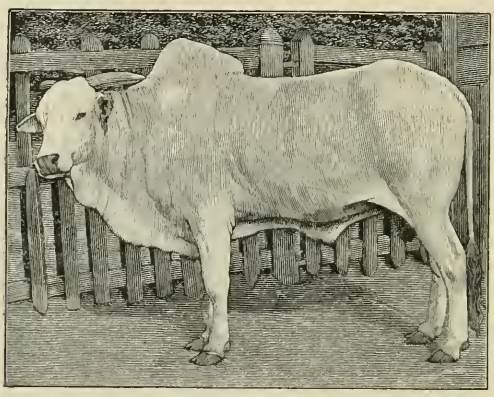


Zebra (*Equus Zebra*).
(From a Photograph by Gambier Bolton, F.Z.S.)

sturdy frame. The true zebra runs in small troops and inhabits the most rugged and inaccessible mountain-ranges of South Africa and Abyssinia, and, it is believed, is found in no other part of the continent. It has been identified as far to the east as the Libomba Mountains between Swaziland and the seacoast, and westwards upon the ranges of Great Namaqualand. Formerly abundant upon every range of the Cape Colony, its occurrence there is now much more restricted, and will, apparently, not long hence cease entirely. Its activity and surefootedness are remarkable, its senses of sight, smell, and hearing very acute, and the least alarm is sufficient to send the whole herd scampering off, with pricked ears and whisking tails, to inaccessible retreats among the mountains. The zebra has been

domesticated and driven in harness, and in the old days the young were for this purpose captured by the Boers and exported to Mauritius; but even when taken young the temper is always vicious and uncertain. A new variety of the true zebra (differing in some respects from the South African type, especially in its closer and finer markings), supposed to have been captured in the highlands of Shoa, north-east Africa, was presented by Menelek, king of Shoa, to President Grévy in 1882. This variety has been named *Equus Grévyii*.

Zebu (*Bos indicus*), a kind of ox very nearly allied to the common ox, of which naturalists generally regard it as a mere variety, although some think it a distinct species. It is also called Indian Ox or Brahmin Ox. The most conspicuous distinctive character is a large fatty hump on the back above the shoulders. The legs are also rather more slender and delicate than in the European ox. The hump attains a very great size in animals plentifully supplied with food and not compelled to work; in those which are ill fed or hard worked it is comparatively small. Mr Vasey found the number of caudal vertebræ in the zebu to be only eighteen, whilst in the common ox it is twenty-one. The zebu is diffused over India, China, the Asiatic Islands, Madagascar, and the east coast of Africa. There are many breeds, differing very much in size,



Zebu (*Bos indicus*).
(From a Photograph by Gambier Bolton, F.Z.S.)

the largest being larger than any oxen of Europe, whilst the smallest are not much larger than a large mastiff. The hump of the largest breeds is said to be sometimes 50 lb. in weight, and by English residents in India is esteemed delicious for the table. There are hornless breeds; but most of the breeds have short horns. There is a breed with two fatty humps, one placed immediately behind the other. In China is a small variety combining the characters of *Bos indicus* and *B. taurus;* the hump is very small. The voice of the zebu resembles the grunting of the yak almost as nearly as the lowing of the ox. The zebu is used in India both as a beast of draught and of burden, is yoked in the plough, and is occasionally used for riding. It can travel from 20 to 30 miles a day, and is very gentle and docile. The Brahminy or sacred bulls of the Hindus, consecrated to Siva, are all of this kind of ox. They are caressed and pampered by the people, and to feed them is deemed a meritorious act.

Zebu, one of the Philippine Islands (q.v.).

Zecchino. See Ducat.

Zechariah, 'the son of Berechiah, the son of Iddo' (the priest of Neh. xii. 4), was born in Babylonia during the captivity, and accompanied the first band of exiles on their return to Judæa under Zerubbabel and Joshua. Nothing further is known of his personal history except that, along with Haggai, in the second and fourth years of Darius Hystaspis (520–518 B.C.), he as a prophet stirred up the languishing enthusiasm of the Jews to complete the rebuilding of the temple. Of the book that bears his name (eleventh in order among the twelve minor prophets) only the first eight chapters are really attributable to him. They consist of three parts under three separate dates: i. 1–6; i. 7–vi. 15; and vii., viii. The first is a brief exhortation to repentance; the second, forming by far the larger portion of his propheey, is made up of eight visions relating to the speedy rebuilding of the temple, the scattering of Israel's enemies, the future greatness and glory of Jerusalem, the priestly dignity of Joshua and the advent of the Messiah, the removal of all wickedness out of the land, and the execution of God's judgments on Babylonia; the third contains a hopeful deliverance on the question as to the permanence of fast days, and gives a bright picture of the Messianic future.

The remaining six chapters of the Book of Zechariah are now regarded with practical unanimity as being really anonymous: they have a different horizon, belong to a different school of propheey, and are separated also by their language and style from the compositions of Zechariah 'the son of Iddo.' They must have been added to the growing book of the minor prophets at a time when the genuine prophecies of Zechariah had already become part of it, and thus according to the usual custom of those times came to be attributed to the last preceding writer whose name was known. They naturally fall into two sections now commonly attributed to two distinct authors. The first of these, consisting of chapters ix.–xi., to which it has been usual, since Ewald, to add xiii. 7–9, may be thus analysed: ch. ix. predicts the judgment about to fall on Damascus, Hamath, Tyre, Sidon, and Philistia, and foretells the advent of the Messiah, the restored prosperity of Judah and Ephraim, and their triumph over the sons of Greece; ch. x. exhorts to trust in Jehovah and warns against 'teraphim and diviners,' through whom Israel has fallen under unworthy rulers; new and better rulers are to be raised up, under whom Judah and Ephraim are to be reunited; ch. xi. begins with allusions to war in the north and east, but is chiefly occupied with the difficult allegory of the shepherd, to which also xiii. 7–9 seems to belong. Among modern critics the prevailing opinion until very lately has been that these chapters belong to the second half of the 8th century B.C. In support of this view it is pointed out that the northern kingdom is still apparently in existence, that Assyria and Egypt figure much as they do in Amos, Hosea, and Isaiah, and that the teraphim and diviners also indicate a comparatively early date. But there are other circumstances, on the other side, that point to a rather late date after the exile, the most important being the reference to the Greeks, which would be most appropriate to the Macedonian period. Driver accordingly inclines to think, with Cheyne and Kuenen, that, while the propheey as a whole dates from the 8th century, it was yet modified in details, and accommodated to a later situation, by a prophet living in the post-exilic period when the Greeks had become formidable to the Jews. As for ch. xii. 1—xiii. 6; xiv., this section of the book used to be assigned to the last days of the Judean kingdom, but is now very generally considered to be post-exilic. It presupposes a state of matters in Judah and Jerusalem of which we have no knowledge, but which may possibly have occurred during one or other of the obscure periods 518–458 or 432–300 B.C.

Stade thinks of the year 300 B.C. as an approximate date for this section. As regards all six chapters, though assigning them to two separate authors, Wellhausen argues for a very late date—as low indeed as that of Antiochus Epiphanes—on a variety of grounds, such as the type of eschatology employed (which was that introduced by Ezekiel), the importance assigned to the temple service, the absence of an actual Davidic king, the allusions to the 'race of Ashdod' (comp. Neh. xiii. 23, 24), to Greece, and to idolatry (of which there was a revival late in the Macedonian period). The presence of phrases suggestive of the older prophecy, and the allusions to Ephraim, Assyria, and the like he explains by the desire of the author 'to give his oracles an archaic garb,' thus inverting the theory of Kuenen, Driver, and others that the oracles are really old, but with later elements superadded. The evidence is certainly conflicting, and the problem may perhaps ultimately prove insoluble with the limited data at command.

See the commentaries of Hitzig-Steiner (1881), Ewald, Keil (Eng. trans.), and Orelli; also C. H. H. Wright, *Zechariah and his Prophecies* (1879); Wellhausen's article 'Zechariah' in *Ency. Brit.*; the same author's *Die Kleinen Propheten übersetzt mit Notcn* (1892); and Driver's *Introduction to the Old Testament* (7th ed. 1897), where further references to the literature of the subject are given.

Zechstein, a deposit of calcareous rock which covers the Kupfer-schiefer. It is the equivalent in Thuringia of the fossiliferous limestones of Permian age of the north of England. See PERMIAN SYSTEM.

Zedekiah. See JEWS, p. 323.

Zedlitz, JOSEPH CHRISTIAN VON, poet, was born at Johannisberg in Austrian Silesia, 28th February 1790, and served with distinction in the 1809 campaign at the battles of Regensburg, Aspern, and Wagram. He afterwards entered the service of the Austrian foreign office, and was commissioner in Vienna for Sachsen-Weimar, Oldenburg, and other German states. He died at Vienna, 16th March 1862. His dramas—*Kerker und Krone*, *Der Stern von Sevilla*, &c.—were long popular; but his name best survives in his lyrics of reflection and narrative—e.g. *Totenkränze* and *Die nächtliche Heerschau*—and in his poetical tales, *Waldfräulein* and *Altnordische Bilder*.

Zedoary (Arab. *Jedwar*), certain species of Curcuma (see TURMERIC), natives of India, China, &c., whose root-stocks (*rhizomes*) are aromatic, bitter, pungent, and tonic, and are used for similar purposes with ginger. They are more used in the East than in Europe. The Round Zedoary of the shops is the produce of *Curcuma zedoaria*, having palmate root-stocks, straw-coloured within. Long Zedoary is produced by *C. zerumbet*, having long palmate root-stocks, yellow within. Zedoary is a powerful sudorific.

Zeehan (Dutch *Zeehaan*, 'sea-hen'), a mining township on the west coast of Tasmania, 29 miles by rail from the port of Strahan on Macquarie Harbour. The name is taken from a prominent mountain, 3 miles south-west, which Tasman discovered in 1642, and christened Mount Zeehan, after one of the two ships which formed his expedition. The township owes its existence to the discovery in 1884, by two pioneer prospectors named Frank H. Long and William Johnstone, of rich silver-lead ores in great abundance, extending over an area of more than 160 sq. m., approaching at its north-eastern limit the peak known as Mount Dundas, where a subsidiary camp has been formed. In 1889 about 130 pioneers were encamped on the field, and in April 1891 this population had increased to upwards of 3000. Hotels, churches, and banks were quickly erected, as well as a post-office, mining exchange, court-house, police-office, and other concomitants of a populous centre. The field in fact was feverishly 'rushed' beyond both the capital and labour resources of the colony, till at the close of 1891 the population was estimated at upwards of 6000, and Zeehan ranked as the third town of the island. With the stoppage of the bank of Van Diemen's Land in August 1891 the unwholesome element of speculation received its first check, and the exodus of drones which followed, while reducing the population, did much to restore a healthy tone to the paramount industry of the district. British and colonial capital has been largely attracted by the extraordinary wealth of the field, and public ore-dressing and smelting works for local treatment of the poorer ores have been erected. The Mount Zeehan Silver-lead Mines, the largest company in the field, had by the end of 1892 exported to England 600 tons of ore, containing 400 tons of lead, and upwards of 60,000 ounces of silver, valued at £25 per ton.

Zeeland. See ZEALAND.

Zeitun, a town 25 miles NW. of Marash in the highlands of the Aleppo province, with iron-mines and some 20,000 inhabitants, mainly Armenian Christians, who have strictly maintained themselves for centuries against Turkish oppression.

Zeitz, a walled town of Prussian Saxony, in the government of Merseburg, 23 miles SW. of Leipzig by rail. It lies in a pleasant and fruitful district on the right bank of the White Elster. The town has a good library, containing 12,000 volumes, and manufactures of woollens, cottons, calicoes, sugar, wax-cloth, leather, pianofortes, cycles, hosiery, gloves, &c. Pop. 19,797.

Zell, or CELLE, a town of Prussia, on the navigable Aller, 28 miles by rail NE. of Hanover, with an active trade and considerable manufactures. From the 14th century it was the residence of the dukes of Brunswick-Lüneburg of the Celle line until the extinction of that branch in 1705; and in the old castle (1485) George III.'s unfortunate sister, Caroline Matilda of Denmark, lived from 1772 to 1775, and here she is buried. For the unhappy Dorothea of Zell see the articles GEORGE I., KÖNIGSMARK. Pop. 19,950.

Zeller, EDUARD, theologian, and the historian of Greek philosophy, was born at Kleinbottwar in Würtemberg, January 22, 1814, studied at Tübingen and Berlin, and settled at Tübingen in 1840 as *privat-docent* in theology. In spite of the strenuous opposition of the more orthodox party he became professor of Theology at Bern in 1847, and at Marburg in 1849, whence he was called to the chair of Philosophy at Heidelberg in 1862, at Berlin in 1872. Perhaps the ablest of the direct disciples of his father-in-law Baur, he forsook theology and his early Hegelianism for historical work which he has carried on in a most impartial and eclectic spirit.

Of his writings the following are the most important: *Platonische Studien* (1839), *Die Philosophie der Griechen* (3 vols. 1844–52; 4th ed. 5 vols. 1876–81), *Das theologische System Zwinglis* (1853), *Die Apostelgeschichte kritisch untersucht* (1854; Eng. trans. 2 vols. 1875–76), *Vorträge und Abhandlungen* (1865; 2d ed. 1875–77–84), *Staat und Kirche* (1873), *David Friedrich Strauss* (1874), *Geschichte der Deutschen Philosophie seit Leibnitz* (1872), *Friedrich der Grosse als Philosoph* (1886), *Grundriss d. Gesch. d. Griech. Philosophie* (1883; Eng. trans. 1886). His magistral work on Greek philosophy was translated into English in the following divisions: *Socrates and the Socratic Schools* (1868); *Stoics, Epicureans, and Sceptics* (1870); *Plato and the Older Academy* (1876); *The Pre-Socratic Philosophy* (2 vols. 1881); *The Eclectics* (1883); *Aristotle* (1897).

Zemindar (Persian), under the Mogul emperors of India, the farmer of revenue from land held in common by the cultivators, as responsible for the revenue, who was in many parts of India treated by the English as landlord, giving rise to the Zemindari system (see INDIA, Vol. VI. p. 115). The zemindar is now in those regions the actual native proprietor.

Zemstvo. See RUSSIA, Vol. IX. p. 37.

Zemzem. See MECCA.

Zenana (Hindustani *zanâna* or *janana;* Persian *zanan*, 'women'), the apartments in which Indian women are secluded, corresponding to the *harem* in Arabic-speaking Moslem lands. In India the Mohammedan women are much in the same position as the women in the other less bigoted Mohammedan countries. Amongst those of the Hindu faith the women of all castes are more or less secluded. Especially among the well-to-do and wealthy and in the higher castes the women were strictly confined to the apartments reserved for them—often those looking into an inner quadrangle—and were never to be seen in public. This usage, like many Hindu usages, does not seem to be based on the oldest Hindu scriptures; but it has been very strictly observed till of late, when the influences of European education and zenana missions have, in the larger towns, done much to relieve the monotony of the Hindu women's lives. Till about 1860, when zenana missions were organised in Bengal by Mr Fordyce, Christian women were not allowed to enter a Hindu zenana. Now thousands of Hindu ladies are taught by British, American, and native Christian women, some of whom are completely trained medical missionaries.

Zend, a word meaning 'commentary' (*zend* = *zand*, from Sansk. *jñâ*, 'to know'), which is a misnomer of European origin when applied (as seems now inevitable) to the ancient East-Iranian and purely Aryan language, in which the Zend-Avesta was long orally preserved and at last written. 'Zend' is closely related on the one side to the Vedic Sanskrit, of which it has been called the elder sister, and on the other to the Ancient Persian (its still younger sister) on the Behistun and Persepolis inscriptions. Its alphabet was elaborated (probably a thousand years after the composition of the Old Avesta, and for the particular purpose of preserving it) out of the obscurer Pahlavi (Pehlevi) forms, which have been still retained in its translations or commentaries. Parsi is the daughter-language of Zend, but showing a quasi-hybrid character by the admission of some Semitic elements; it is written either in the Zend character or the Perso-Arabic. Pahlavi may be said to be the same language, but rendered difficult by the use of the most obscure of all characters, and by the presence of some hundreds of logograms which were spoken Aryan but written Semitic, *Malkân Malkâ* ('king of kings') being spoken *Shâhân Shâh*. A knowledge of their languages as well as the Vedic Sanskrit is essential to the complete criticism of the Avesta, many correct definitions not suggested by Vedic analogies being offered by their uses.

ZEND-AVESTA, the 'commentary lore' (*zend*, as above; *âvesta* or *âvista* being regular for *âvitta* (*vid*); Pahlavi *Avistâk va Zand*), comprises the ancient sacred writings of the Parsees, which, however, appear in no one MS., and are marked only by their language and general subject as a homogeneous whole. They occupy with their repetitions about a hundred thousand words, although there is good evidence that they were many times more voluminous, twenty-one books like the Vendîdâd having once existed and been lost. Like other sacred documents, they include works of widely differing character and age, representing the Zoroastrian religion at several differing stages in its development; they were collected into their present canon under Shahpuhar II. (Shahpur II.; 309–338 A.D.), having also received the attention of the Persian government in the non-Zoroastrian (Arsacid) period under Valkhash (Vologeses I.), a contemporary of Nero. The *Yasna* (sacrifice-liturgy) is itself a grouping together of important documents surrounding the Gâthas, which as the only original and historical part, separated from all the other surviving documents, are by centuries the oldest and also otherwise the most important part of the Yasna and of the Avesta. The *Visparad* ('all the seasons,' or 'chief objects worshipped at the seasons') seem to have been additions to the several chapters of the Yasna (see the Vendîdâd Sâde, where they are mostly so written). They celebrate each sacred object as for the moment 'chief of the ritual.' The *Vendîdâd* (*vî-daêvo-dâtâ*, 'laws established against the Demons') is again a compilation of widely differing matter, including valuable myths and extensive prescriptions for the exorcism of the Demon of putrefaction, together with more serious laws, while the *Yashts* are mostly invocations addressed to particular divinities. The *Niyâyishes* are daily praises to the sun, moon, water, fire, &c.; the *Afrînagân* are blessings repeated six times in the year over certain meals in memory of the dead; the *Gâhs* are prayers at the five watches of the day and night; the *Sîrôzah* enumerates the attributes of the spiritual beings who preside over and give names to the thirty days of the month; and then there are later fragments.

A separation of these parts, especially of the two great divisions of Old and New Avesta, is indispensable to all serious consideration of the work, and the very regrettable but wide-spread neglect of such a distinction has simply left the lore of the original Avesta, the Gâthas, for the most part wholly lost in the nature-worship and superstitions of the later books. In the original Avesta none of the polytheistic features of the Veda and later Avesta appear. There is no sun-worship, nor moon-worship as noted above, no star-worship, nor Mithra-worship, nor Tishtriya(Sirius)-worship, and no Haoma-worship. There are even no Fravashis, the forth-existing (hardly 'pre-existing') guardian spirits of the dead (cf. the pitaras and manes) or of invisible and immortal beings. The very attributes of God escape perhaps entirely their later inferior but still sublime dogmatic personification; their personification even when they are invoked may be a higher poetical personification leaving them still the characteristics and not merely the archangels of a Supreme Being. And he is not yet at all identified with 'light' as so often stated; nor did he 'create the world by his Word the Honover' (*Ahuna vairya*) which is a later prayer (*Yathâ ahû vairyô*) founded on a line of the Gâthas. Zoroaster his prophet did not laugh at his own birth (Pliny) nor 'withdraw from the world,' nor 'live on cheese for thirty years,' and out of the heap of this rubbish we must dig that remarkable religion which was not surpassed or equalled by any lore outside of the Semitic Scriptures. It is contained in seventeen precious fragments in Aryan metres like the Vedic Trishtup, Gâyatrî, and Âsurî, not more extensive than, say, thirty or forty average Vedic hymns. In these the supreme Deity Ahura Mazdâh, the Living God or 'Lord' (*ahu* = 'the living,' 'life,' or 'spirit,' root *ah* = 'to be'), the Great Creator (*maz* + *dâ* = Sansk. *mahâ* + *dhâ*), or 'the Wise One' (cf. *su-medhâs*), is represented as endowed with and acting through six attributes, *Vohu Manah*, his

Good Mind (Benevolence; possibly 'his sagacity'), *Asha* (Vedic ṛita), his Order (the plan and symmetry of his works, an idea developed from the regularity of the seasons as the appointed times for prayer), his Sovereign Power *Khshathra*, his Perfect-mindedness *Aramaiti* (when dwelling in the pious worshipper it is 'complete readiness of mind,' 'devotion,' 'piety'), then his *Haurvatât*, welfare, wholeness, and its abiding character his Immortality, *Ameretatât*. These are practically the forms under which he shows himself as the Creator of heaven and earth and of all good things to his faithful worshipper the thrifty guardian of the herds, which as the source of honest livelihood had already become sacred, and were represented by the 'Mother Cow,' and by the 'Kine's Soul.'

The saintly citizen was also of necessity a tiller (*vâstriya*) of the not yet superstitiously sacred or worshipped earth, and an adherent to, or member of, the *Maga* (see below), the sacred Cause or Commonweal, more definitively expressed in the Holy Law the *Daêna*, the Insight (of conscience, &c.; cf. *din*, root *dî* = *dhî* = 'to see'), by which he exercised his obedience *Sraosha* (not yet the personified angel) in 'caring for the poor.' In which duty he was opposed by the non-agricultural (*avâstriya*) freebooting Daêva(Deva)-worshippers who were struggling with him for the control of the territory, aided by the Turanians on the north, only a handful of whom became the Friendlies (*Fryana*) by conversion. These enemies invaded his fields with murderous rapine (*Aêshma*), carrying on a warfare which was at once a scene of raid and battle embittered on the one side (that of the Daêva-worshippers) by the divergencies of religious belief. And this in the course of protracted experience brought out into sharper outlines the recognition of one dreadful and self-dependent spiritual power, *Añgra Mainyu*—the assaulting (?) spirit—who was alone responsible for those sufferings which made Iranian life a load, and who acted through his chief attribute the Plotting Lie (*Drukhs*, *Druj*), perhaps, but not certainly, already dogmatically personified. He also instigates the Assault of the Raid *Aêshma* (see above), being animated by his *Aka Manah* (or *Achishta Manah*, Evil or 'Worst' Mind, insanity), which corresponds antithetically to *Vohu Manah*, although no full six attributes symmetrically corresponding to those of Ahura appear in those portions of the Gâthas which have survived to us. The *moral idea* is analysed as to thought, word, and deed, and represented as actuating the holy people in their struggle against their powerful and dangerous assailants, little room being left (as in the later Avesta) for anathematising such corruptions as Pride, Scorn, Slander, Envy, the Harlot, the Sorceress. These were however doubtless quite as fully reprobated by the earliest saints. In the last 'turning of the world' the faithful Mazda-worshippers were (together with their less civilised opponents) to undergo a final ordeal. This the faithful successfully meet by passing, encouraged 'by their own conscience,' over the Chinvat, the Judge's (or the Assembler's ?) Bridge. This extended toward the Home of Sublimity (or Song) Demâne Garô, which was a Heaven of good thoughts and words and deeds, the scene of God's manifestation as the rewarder. And to this they, the faithful, are welcomed by the souls that have gone before; and there they are to enjoy unending felicity. Whereas the wicked failing to pass the 'narrowed' Bridge (so in the later Zoroastrianism) and 'curst by their own consciences' (so literally) fall to the Abode of the Lie-Demon. There they are met by the souls of the already damned with poisoned food and vile reproaches, and enter a Hell of evil thoughts and words and deeds where they remain for ever.

Such is the Gâthic or original Zoroastrian religion. There is one allusion to the very ancient myth of Yima, Vedic *Yama*. The god Vayu may possibly be mentioned, but the word may be an exclamation. The Fire is already the symbol of holiness, and we have an allusion to an ordeal by means of it. (This later, and not in Gâthic times, degenerated into the full imposture of the Nirang-i-var, which consisted in pouring molten brass on the breast as a test of innocence.) Beyond these there is little trace of lower elements. 'The wail of the Herd's soul' is poetically represented as articulate, and Zarathushtra is figuratively said to question Ahura; but such features recur in all similar ancient as in modern compositions. The system, if not a pure Unitarianism, is certainly a pure Dualism.

The *later Avesta*, notwithstanding great difference in the character of its many component parts, may here be treated collectively. In it, while the sublimity maintains itself as throughout, the scene is changed, and the now established religion has paid for its success by the acceptation of doubtfully desirable additions. Ahura is still supreme, save in two foolish passages where he compliments inferior deified objects by joining in the sacrifice to them, which however is by the fact itself shown not to have involved what we call 'worship,' and the bathos is not so decided as in the case of the drunken Indra. God's attributes have become dogmatically personified Archangels with great loss of original meaning. Their names are then given as the Amesha Speñta (Amshaspends), Immortal Bounteous (or 'Holy'?) Ones. Vohu Manah (still later) becomes the representative of the good creation, Asha Vahishta of the fire, Khshathra-vairya of metals (from an accidental occurrence of words); Spenta Ar(a)maiti becomes the earth; Haurvatât represents the waters (merely accidentally, and hardly from the healthfulness of waters); Ameretatât represents plants. The Fravashis, the 'forth-existing Manes,' appear. The Fire receives sacrificial veneration, as do the sun, moon, stars, earth, verdure, waters, &c. Still later six seasons of creation are distinguished, and the five divisions of the day. Sraosha becomes a warrior angel, and the Gâthas are so ancient that their present number, 'five,' is recognised and mentioned as they are 'worshipped.' Zarathushtra loses all his human traits, and becomes a mythic demigod, conversing literally with Ahura. Laws are given through him, some of them wise and some of them excessively trivial. The Haoma-worship (see SOMA) begins, then Mithra and a throng of gods appear, and the Avesta becomes almost the Rik, and with more of its metres. The Vedic gods are often, but not always, turned into devils. *Vis à vis* to the Amesha Speñta (see above) appear correspondingly as *six demons* Aka Manah (the Evil Mind), Indra, Sauru (cf. Çarva, a name of Çiva), Nâonghaitya (Ved. Nâsatya), Tauru (cf. Sansk. *tura* = wound), and Zairika (cf. Sansk. *jaras* = decay), actually grouped, however, with their opposed divinities only in the greatly later Pahlavi Bundahish.

As to the *birthplace* of the Avesta, we must postulate several different regions for the different works. The privileges of the Zarathushtrian Ragha mentioned in the later Avesta have been supposed to confirm the claims of that province to be the cradle of Gâthic life; but they may have had little to do with it. Airyana Vaêja (the Aryan starting-place) is lost in prehistoric mists. In the Vendîdâd we have, although in less original forms, the well-known names of Sughdha (Samarkhand?), Môuru (Merv), Bâkhdhi (Baktra, Balkh), Harôyu (Hariṛud), Vehrkâna (Jorjan), Harahvaiti (Harût), Haêtamant (Helmend), Ragha (Rai), Hapta Hindu (Punjâb); and these according generally with the statements of the later Greeks lead us to look

towards the east of Iran, where the Daêva-worshippers must have once lived before they became 'River-men' (Hindus) by descending into the Five Waters (Punjâb). Keresaspa, an early hero, is located at Kabul, and the name Jemshid still lingers in Eastern Iran. Later the lore may have travelled westward, for Atropatene became a centre; but a religion as like the Avesta as parts of the Avesta are like each other was at home in all Media and Persia under the Achemenids, Arsacids, and Sassanians up to the Arabic conquest in 650 A.D., and a fragment of its adherents still linger at Yezd and Kerman (see PARSEES).

The *age of the Avesta* is to be estimated from its oldest part, the historical, which under no circumstances can be put later than 700 or 800 B.C.—i.e. two or three centuries before the inscriptions of Persepolis and Behistun, *c.* 500. These mention the Magians, who, by several usages never Gâthic (especially by the exposure of the dead), are identified with the later Avesta, and several centuries are necessary to account for the change. The language of the inscriptions is also in an advanced stage of decay from the earlier inflections; and this, while not decisive, has much weight, for newer language is on the whole more natural to newer writings than older forms. History is on the side of a remoter antiquity, for some of the Greeks placed Zoroaster very long before their time. But the proper test is *criticism*, which places the Gâtha close beside the oldest hymns of the Rig Veda—say 1200 to 1500 B.C., Zoroaster being mythically associated with the ancient Yima (Sansk. *Yama*). But we may be led on to accept a still remoter antiquity for the Gâthas. The absence of Mithra, Agni, Indra, and even of Soma (Haoma) and the Pitaras (Fravashis), demands a new if alternative hypothesis, which is not that they were dropped gradually or suddenly (Haug), but that these deities were still unknown and therefore ante-dated (in Iran). And this would place the Gâthas so far back as to enable us to account for the name of *magu* (which is strictly Aryan), as carried down by Turanian Akkadians to Babylon, and also for the appearance of Zoroaster's name in those regions (cf. Polyhistor as cited by Professor Rawlinson, Sir H. Rawlinson having also conjectured a Semitic etymology for the word). The earlier part of the later Avesta should be placed at about 600 B.C. to account for the exposure of the dead, &c., mentioned by Herodotus as Magian, while its later (genuine) portions extend say to the 3d century B.C., and easily recognisable additions may be indefinitely later.

The *influence* of the Avesta, or of the ancient lore of which it is a fragment, was possibly felt first in Babylon (see above), but also extended later and adversely to hostile India, where its *daêyus* were reprobated as *dasyus* and its Ahura classed with the now later reprobated Asuras. But Mazdâh-worship, of which the Avesta was the chief exponent, extended over all Iran and Media, as well as Bactria. Añgra Mainyu his great adversary is as fiercely represented on the inscriptions of Darius as he is in large portions of the Vendîdâd, where Druj, his representative, defiles by impurity, as he does so often on the tablets by the Plotting Lie (Draogha). The actual name Añgra Mainyu does not appear either on the rocks mentioned or in the greater part of the Vendîdâd itself. Even Haurvatât and Ameretatât, the great Amshaspends, Weal and Immortality (two of the Seven), are totally absent from one entire third of the Avesta, and this renders the negative argument from the absence of the names from the Inscriptions worthless as proof against the recognised existence of either these Gods or of that Demon at the dates indicated. The Inscriptions are full of the spirit of the Avesta, which may possibly be named Âbasta (so Oppert); or they are full of a lore from which both sprang. If not the Avesta, then a closely related sister-lore influenced the 'Cyrus' of Isaiah, the 'seven spirits' of Zechariah (cf. also Rev.), the Pharisees who were the Farsees = Parsees, &c. The Avesta influenced the Gnostic philosophy in its sources—cf. the δημιουργὸς εὐνοίας = Vohu Manah (Plutarch), δημιουργὸς σοφίας = Aramaiti (Strabo), the δημιουργὸς πλούτου = Haurvatât (Plutarch), and Ἀ(μα)ν[α]δατος** = Ameretatât (Strabo). It influenced Jakob Boehme (born 1575), and through him Schelling, and even the modern antithetical *Dialektik* and dualism (see Zeller's *Geschichte der deutschen Philosophie*, pp. 14 and 687). For the traditional development among the Indians, see the article PARSEES.

Literature.—Spiegel's Yasna and Vendîdâd texts have also the Pahlavi translation. Geldner's objective edition gives an invaluable mass of variations. For the translations, see the *Sacred Books of the East*, by Darmesteter and the present writer (vols. iv. xxiii. and xxxi.); the latter's Gâthas, with literal and free translations, commentary, and the Zend, Pahlavi, Sanskrit, and Persian texts (Brockhaus, 1892); also Darmesteter's Yasna in French (1892).

Zengg (*Senj*), an Austrian port on the Croatian part of the Adriatic coast, 75 miles SE. of Trieste, with an old cathedral and some trade. Pop. 3039.

Zenith, a word, like *Nadir*, borrowed from the Arabic, is the name given to that point of the heavens which is exactly overhead—i.e. in line with the spectator's position and the centre of the earth. It is thus the upper pole of the spectator's horizon, as the nadir is the under pole.

Zenjan, a town of Persia, half-way between Tabriz and Teheran, with bazaars and some local and transit trade. Pop. 15,000.

Zeno, a Greek philosopher who flourished about 500 B.C. at Elea, a town of Lucania, in Italy. A favourite disciple of Parmenides, he came with him to Athens, and there the illustrious Pericles was one of his pupils. According to the account usually given, on his return to Elea he joined an unsuccessful conspiracy to deliver his native town from the tyrant Nearchus, and the severest tortures failed to make him betray his accomplices. To ensure his silence he is said even to have bit his tongue off and spat it in the tyrant's face. He held the usual doctrines of the Eleatic school respecting the unity and the immutability of all things, distrust in knowledge acquired through the senses, and reliance on pure reason. He did not deny that there were phenomena or appearances, but he maintained that these were not real existences, in anticipation of Bishop Berkeley. Of his famous four arguments against motion the best known is that of Achilles and the tortoise. But he is chiefly remarkable for having been the first to employ the style of argument known by the name of Dialectics, in which error is refuted, and truth sought to be established, by the *reductio ad absurdum*—a method so skilfully employed afterwards by Socrates and Plato. He devoted his great powers of argument to enforce the doctrines first broached by Xenophanes, and more systematically developed by Parmenides. His works were in prose, but only small fragments have been preserved. See Zeller's *Pre-Socratic Philosophy* (Eng. trans. 1881).

Zeno (342–270 B.C.), founder of the Stoic philosophy, a native of Citium in Cyprus. His father was a merchant, and it is said that some stray writings of the Socratic school he brought with him in his trading voyages made Zeno a philosopher. At two-

and-twenty he came to Athens, attaching himself first to the Cynic Crates. But he soon became dissatisfied with the Cynics' conventional disregard for conventionality and indifference to speculative inquiry, and next joined the school of the Megaric Stilpo. Still unsatisfied he betook himself to Polemo the Academician; and having thus made himself master of the tenets of the various schools, he proceeded to open a school for himself in the 'Painted Porch' (*Stoa Poikilē*). Here he taught, honoured by all, until in extreme old age he voluntarily put an end to his life.

See STOICISM; also Zeller, *Stoics, Epicureans, and Sceptics* (Eng. trans. 1870); R. Hirzel, *Untersuchungen zu Cicero's phil. Schriften* (vol. ii. 1882); and A. C. Pearson's *Fragments of Zeno and Cleanthes* (Camb. 1891).

Zeno, EMPEROR. See BYZANTINE EMPIRE.

Zeno OF TARSUS, the successor of Chrysippus, leader of the Stoic school. He expressed himself doubtfully about the doctrine of the conflagration of the world.—ZENO OF SIDON, an Epicurean philosopher, pupil and successor of Apollodorus, taught with great success at Athens down to 78 B.C., and is warmly praised by Diogenes Laertius and Cicero. His fellow disciple and successor Phædrus was heard by Cicero at Rome as early as 90 B.C.

Zenobia, SEPTIMIA, queen of Palmyra, was a native of the city, of Arab descent probably, and became the wife of the Bedouin Septimius Odænathus, who in 264 A.D. was appointed by Gallienus governor of the East. From 266 she and her young son, Wahballath or Uaballathus, shared Odænathus' power, and on his murder (*c.* 270) nearly the whole of the eastern provinces submitted to her sway. When Aurelian assumed the purple, he marched against her with a large army, and, after defeating her in several battles, besieged her in Palmyra. Her hopes of being relieved by the Persians and Arabians being disappointed, she attempted to escape by flight, but was captured, 272. Before the conqueror her courage failed, and she saved her own life by imputing the blame of the war to her counsellors, especially her secretary, the celebrated Longinus (q.v.), who was accordingly beheaded. Zenobia was led in triumphal procession at Rome, decked with splendid jewels, and almost fainting under the weight of gold chains. She was presented by her conqueror with large possessions near Tivoli, where, in the society of her two sons, she passed the rest of her life in comfort and even splendour. She was a woman of great courage, high spirit, and strikingly beautiful. With purity of morals in private life she combined prudence, justice, and liberality in her administration. Her literary acquirements were considerable; she spoke Latin and Greek, as well as the oriental languages, with fluency. Pagan emblems on her coins disprove the notion that she was of Jewish faith. See Wright's *Palmyra and Zenobia* (1895).

Zenta, a town of Hungary, on the Theiss, 33 miles S. of Szegedin by rail, with an active trade in cattle. Pop. 21,200. Here Prince Eugene defeated the Turks, September 11, 1696.

Zeolite (Gr. *zeō*, 'I boil'), the common name of a large group of minerals, often called the Zeolitic family. They receive this name from their melting and bubbling up before the blowpipe. They are all soluble in acids, and most of them gelatinise in acids in consequence of silica being set free. They are hydrated silicates of alkalies or alkaline earths, most of them containing alumina. Magnesia is rarely present in them. Their composition, however, is very various. They are generally found in amygdaloidal cavities, or in fissures of basalt, porphyrite, &c., and occasionally also in granite, gneiss, and other crystalline schists and altered rocks, apparently as deposits from water percolating through the rock. They sometimes, but rarely, occur in veins. They are found either in crystals or of crystalline structure, often in plates or fine scales, often in needles or fibrous. Among them are *Analcime*, *Natrolite* or *Mesotype*, *Scolezite*, *Thomsonite*, *Stilbite*, *Heulandite*, *Phillipsite*, *Gmelinite*, *Chabasite*, *Harmotome* or *Cross-stone*, *Apophyllite* and *Laumonite*. The number of species and varieties which have been described and have received distinct names is very large.

Zephaniah (Heb. *Çephanyah*—i.e. 'whom Jehovah hides' or 'protects'), a Hebrew prophet who flourished under Josiah towards the end of the 7th century B.C. He is described in his book as a great-great-grandson of Hezekiah; probably the king of that name is intended. From his allusions to prevalent idolatry in Judah and Jerusalem it may be inferred that Zephaniah wrote previously to Josiah's great reform in 621 B.C., and that his prophetic work helped to promote that movement. His brief prophecy may be divided into three parts: i., ii. 1—iii. 7, and iii. 8–20. The first, which may be entitled the menace, is an announcement of wide-spread destruction imminent over man and beast, bird and fish, and in particular over Judah and Jerusalem, especially its corrupt court-officials, its merchants, and those who profess religious indifferentism. The 'day of Jehovah' (a day of battle, not of assize) is described in dark and gloomy colours. In the second part, or the admonition, Israel is exhorted to escape by timely repentance from the doom about to overtake the Philistines, Moab and Ammon, Ethiopia and Nineveh. Here the prophet seems to have in his mind the Scythian invasion with which Egypt was threatened in 626 B.C. The promise is contained in the third part. The faithful in Jerusalem are bidden wait patiently for the fulfilment of the divine judgments, after which all nations will serve Jehovah with one consent, and the purified remnant of Israel will rejoice in God's presence among them, and become 'a name and a praise among all the peoples of the earth.'

Zeppelin Air-ship. See BALLOON.

Zerafshan. See BOKHARA.

Zerbst, a town in the duchy of Anhalt, capital of the former duchy of Anhalt-Zerbst, on a tributary of the Elbe, 26½ miles SE. of Magdeburg by rail. The church of St Nicholas is a beautiful specimen of Gothic architecture. Pop. 15,069.

Zermatt, an important centre for tourists in Switzerland, is a small village of (1888) 525 inhabitants, near the upper end of the Visp valley in Valais, 25 miles SSW. of Visp by the railway opened in 1891. It stands 5315 feet above the sea, having to the south the great Théodule glacier, above which towers the Breithorn on the east and beyond the Monte Rosa group, and on the west the rocky cone of the Matterhorn. The churchyard contains the graves of many of the victims of mountaineering. The Théodule Pass or Matterjoch (10,899 feet) leads to Aosta in Italy.

Zero (Fr. *zéro;* Ital. *zifro;* Arab. *sifr*, 'cipher'), the number 0 (see NUMERALS), and the point from which the reckoning begins on Scales (q.v.) such as those of the barometer, &c.

Zetland. See SHETLAND.

Zettinye. See CETINJE.

Zeuglodon (Gr., 'yoke-toothed'), a fossil whale-like mammal, so named by Owen from the yoke-like, double-rooted formation of its cheek

teeth. The remains of the Zeuglodon were first found in Louisiana in 1839; an almost complete specimen, 70 feet long, was obtained in 1843 in Alabama. The creature had an elongated snout, and is regarded by Huxley as intermediate between true cetaceans and carnivorous seals. Its remains occur in the older tertiary deposits of England, Egypt, and North America.

Zeulenroda, a town of the German principality of Reuss-Greiz, 51 miles SSW. of Leipzig. Pop. 7970.

Zeus, the greatest of the national deities of Greece, was, according to the most received mythology, son of Cronos and Rhea. With the help of his brothers and sisters, Poseidon, Hades, Hestia, Hera, and Demeter, he overthrew Cronos and the Titans, assumed the sovereignty of the universe, and took as his peculiar province the heaven above, giving to Hades the infernal regions, to Poseidon the sea, the earth being left subject to the influence of all three, although to Zeus belonged the supremacy. Next him stood his sister and consort Hera, mother of Ares, Hephæstus, and Hebe. This was his rightful wife, but her position did not preclude a number of inferior marriages with other goddesses, and intrigues with mortal women, as Europa, Antiope, Callisto, Semele, Danae, Io, Leda, Alcmena, &c. Thus he swallowed his wife Metis to bring forth Athena from his own head; Themis bore him the Hours and the Fates; Eurynome, the Graces; Demeter, Persephone; Mnemosyne, the Muses; Maia, Hermes; Leto, Apollo and Artemis. Crete, Rhodes, Dodona, and Arcadia were the places where the worship of Zeus was most cultivated, but of all places Mount Olympus in Thessaly and Mount Ida in the Troad were his especial haunts. All the local cults of Zeus came gradually to be merged in one great Hellenic divinity—a process carried still further when Zeus was identified with the Jupiter of the Romans and the Ammon of Libya.

Besides the epithets of Zeus from the seats of his worship, he had many titles applied to him from his various powers and functions, moral and physical. He was the father and king of gods and men; the protector of kings, of law and order; the saviour and giver of victory; the avenger of broken oaths and of other offences; he watched over the state, the assembly, the family, over strangers and suppliants; his hand wielded the lightnings and guided the stars; he ordained the changes of the seasons, and, in short, regulated the whole course of nature. All prophecy, too, was supposed to originate in him, and it was from him that Phœbus Apollo received his oracular gift. He dispensed, as it pleased him, both weal and woe to mortals; but whether he could control the Fates themselves is a point about which the ancients disagreed, as men have done of the Supreme deity in all ages where the problems of free-will and fate cross each other. Of the many epithets applied to Zeus perhaps the best known is the 'Olympian,' from that Olympus in Thessaly whose summit was believed to be his residence as well as that of the other gods. His most celebrated festival was the Olympic, held at Olympia, in Elis, after the end of every fourth year.

These exalted conceptions of the majesty and power of Zeus harmonise indifferently with the stories of his amours with mortals and immortals, as well as with the motives of caprice, anger, deceit freely attributed to him. Solar mythologists have made bold to explain transformations into a bull and the like as originally a poetic and symbolical realisation of natural phenomena. But it may be gravely doubted if there is any foundation for these theories beyond the fact that the name (Sanskrit *Dyaus*) undoubtedly means *sky*. It is much more probable that Mr Lang's theory is true—that such a mythological growth as the traditional Zeus is a confusion of myths of perverted history, of primitive physical conceptions, and elementary pantheistic speculation, added to native myths descending from a totemistic stage of culture.

See MYTHOLOGY, ANIMALS (WORSHIP OF), BEAST-FABLES, and JUPITER; also Welcker's *Griechische Götterlehre;* Preller's *Gricch. Mythologie;* and, for Zeus in art, Overbeck, *Griech. Kunstmythologie* (vol i. 1871).

Zeuss, JOHANN KASPAR, the founder of Celtic philology, was born at Vogtendorf near Kronach in Upper Franconia, 22d July 1806. He studied philology and history at Munich, became professor in the Lyceum at Bamberg in 1847, and died at his birthplace, November 10, 1856. His three chief works were *Die Deutschen und die Nachbarstamme* (1837), *Die Herkunft der Bayern von den Markomannen* (1839), and his great masterpiece of erudition and method—*Grammatica Celtica* (2 vols. 1853; 2d ed. by Ebel, 1868–71).

Zeuxippus, one of the eight successors of Ænesidemus in the leadership of the revival of Pyrrhonian Scepticism.

Zeuxis, the celebrated painter, was born at Heraclea, but whether that in Lucania or on the Euxine, is unknown. He is also styled of Ephesus, which means that he belonged to the Ionian school of painters. He flourished from *c.* 420 B.C. to near the end of the century, and was at Athens about the beginning of the Peloponnesian war. He excelled in the treatment of light and shade, in accuracy of imitation of natural objects, and in rendering types of sensuous beauty, especially of women. His most famous pictures were 'Zeus enthroned;' 'Helen,' his masterpiece, painted for the city of Croton; 'The Infant Hercules strangling the Serpents;' 'The Female Hippocentaur.' By the exercise of his art he attained to great riches and fame, and, like his rival Parrhasius, was exceedingly conscious of his pre-eminence. He repeatedly presented rather than sold pictures to cities that were anxious to possess them, because he thought no money-price could pay for them.

Zeyla. See SOMALI-LAND.

Zeyst, a large village in the Dutch province of Utrecht, with manufactures of soap, candles, porcelain-stoves, &c. Here settled in 1746 a still thriving society of Moravian Brethren. Pop. 6372.

Zhitomir, or JITOMIR, chief town of the Russian government of Volhynia, on an affluent of the Dnieper, 80 miles W. of Kieff. Pop. 56,782.

Zhob, a river of southern Afghanistan (or northern Beluchistan) which joins the Gomul north-west of the Suliman Mountains, and with it flows into the Indus near Dera Ismael Khan. There are valuable passes into Afghanistan both by the Gomul and the Zhob valleys—the latter of which was annexed by Britain in 1889 (see the map at AFGHANISTAN).

Zibet. See CIVET.

Zidon. See SIDON.

Ziegenbalg, BARTHOLOMEW, missionary, was born 14th June 1683 at Pulsnitz in Lusatia, studied at Halle, and on the call of Frederick IV. of Denmark went to establish Christian missions in the then Danish colony of Tranquebar, where he arrived in 1706, dying there in February 1719. He published a Tamil grammar and a Bible in Tamil.

Ziegler, HEINRICH, theologian, born at Posen, 16th May 1841, studied at Berlin and Jena, and at the Wittenberg *Seminarium*, lectured in gymnasia at Berlin, and in 1874 was nominated *Diakonus* in the St Peter-Paul church at Liegnitz, when the

Consistory at Breslau opposed the nomination, which was, however, confirmed by the supreme Church Council, and in 1877 advanced to be Pastor Primarius of his church. Among his writings are *Die Lehre des Irenäus* (1868), *Irenäus der Bischof von Lyon* (1871), and *Die Gegenreformation in Schlesien* (1888). After Keim's decease he edited *Rom und das Christenthum* (1881). His five lectures, *Der Geschichtliche Christus* (1891), sorely exercised the Breslau Consistory.

Zierikzee, chief town of the Dutch island of Schouwen (q.v.); pop. 7043. It was taken by the Spaniards in 1576 after an obstinate defence.

Zieten (or ZIETHEN), HANS JOACHIM VON, Prussian cavalry general, was born at Wustrau in Ruppin, 14th (24th) May 1699, entered the service at fifteen, but retired in 1724, only to rejoin in 1726. A quarrel with his captain brought him a year's imprisonment and dismissal from the service, but in 1730 he was rehabilitated. As colonel of a regiment of hussars (1741) he did much to increase the efficiency of the Prussian light cavalry. In 1744 at the head of the advanced guard he burst into Bohemia, and then executed a dexterous retreat behind the Elbe, in the course of which he beat back an attack of 16,000 men at Moldau-Tein (12th October). He covered himself with glory at Hohenfriedeberg (4th June 1745), and, throughout the Seven Years' War, at Prague, Collin, Leuthen, and Liegnitz, where he was made general of cavalry on the battlefield (15th August 1760). The victory at Torgau (3d November 1760) was in great measure due to his dash and vigour. After the peace 'Old Father Zieten' lived out his days in retirement at Berlin, in especial favour with the king, and died 26th January 1786. See Life by Winter (2 vols. 1885).

Zillerthal, a Tyrolese valley watered by the Ziller, a tributary of the Inn, whose inhabitants are noted for their handsome figures and their admirable singing. In 1837, 400 of their number, feeling auricular confession a grievance and inclining to Protestantism, were compelled to leave their homes, ultimately settling at Erdmannsdorf near Liegnitz, in Prussian Silesia.

Zimb. See TSETSE.

Zimbabye, or GREAT ZIMBABWE, a notable ruin in Mashonaland, in 20° 16′ 30″ S. lat. and 31° 10′ 10″ E. long., and 3300 feet above sea-level. It is the principal of a series of similar remains along the west side of the Sabi River, and consists of a large elliptical building (280 feet long, with walls 35 feet high and 16 feet thick) on a gentle rise, with buildings extending into the valley, and an immensely strong labyrinthine fortress on the opposite hill, 400 feet above. The older buildings are beautiful examples of dry masonry. There are a considerable number of little images of the solar disc; whilst the two conical towers in the sacred enclosure on the lower hill, as well as the chevron ornamentation there, and various objects found in the citadel point to phallic forms of worship. The ruins evidently formed a garrison for the protection of a gold-producing race in remote antiquity, of whose work many traces have been found—a smelting-furnace made of hard cement, clay crucibles with little specks of gold adhering, an ingot mould of soapstone, burnishers, crushers, carved soapstone birds, &c. Mr Theodore Bent, who explored the ruins in 1891, assigns this enterprise to pre-Mohammedan Arabians (with possibly Phœnician influences), as both the objects of art and the special cult indicated are utterly foreign to the African races. K. Mauch would identify the region with the Ophir (q.v.) of Solomon's time. See Bent's *Ruined Cities of Mashonaland* (1892), and Mauch's *Reisen* (Gotha, 1877).

Zimisces. See BYZANTINE EMPIRE, p. 601.

Zimmermann, JOHANN GEORG, RITTER VON, philosophical writer, was born at Brugg in the canton of Aargau, 8th December 1728, studied medicine at Göttingen, and by his dissertation, *De Irritabilitate* (1751), laid the foundation of his fame. After a tour through Holland and France, he became town-physician at Brugg, and here he published his famous book *On Solitude*, a work of artificial melancholy and sentiment, which had a vogue now somewhat difficult to understand, and was translated into almost every European language (*Ueber die Einsamkeit*, 1755; entirely new ed. 4 vols. 1784–85). Other works were *Vom Nationalstolz* (1758), and *Von der Erfahrung in der Arzneikunst* (2 vols. 1764). From 1768 first body-physician to George III. of England and Hanover, he was summoned to Berlin to the last illness of Frederick the Great, and after the king's death published several vain and worthless books about him. He died 7th October 1795. See the book by Bodemann (Hanover, 1878).

Zinc (sym. Zn, eq. 65, sp. gr. 6·9 to 7·15) is for many purposes a valuable metal. Some coins struck by the Romans early in the Christian era are of brass (an alloy of copper and zinc), but as zinc was not then known as a separate metal, it is believed that this brass had been produced by adding to melted copper the mineral calamine, which we now know is a zinc ore. Paracelsus (q.v.) pointed out that zinc was a metal; but the exact nature of this metal and of its ores was not distinctly known till the 18th century. But zinc appears to have been used in China, and perhaps also in India, from an early period.

Zinc is a bluish-white metal, breaking with a crystalline fracture. When chemically pure it is malleable and ductile at ordinary temperatures, but all commercial zinc is somewhat brittle until it is raised to the temperature of 212° F. or preferably to 300° F. (149° C.), when it can be hammered, drawn, or bent. It is rather remarkable that it does not readily become again brittle when cooled, although workmen manipulating zinc out of doors in winter generally take the precaution to previously heat it over a fire. If zinc is raised to a temperature as high as 400° F. it becomes so brittle that it can easily be reduced to powder. The melting-point of this metal is 773° F. (412° C.), and its boiling-point is 1904° F. (1040° C.). It burns in the air at a high red heat with a bright, greenish-white flame, emitting dense white fumes. It is only slightly acted on by air and moisture, but when exposed to these it rapidly loses its bright metallic lustre, taking on a thin grayish film which protects the metal beneath from the further action of oxygen and carbonic acid. Pure zinc is only very slowly attacked by mineral acids, but all commercial kinds dissolve in them very readily with evolution of hydrogen. Ordinary zinc will also dissolve in a warm solution of potash or soda. A slight crackling sound is produced when the metal is bent after fusion, and even with sheet-zinc prepared for use this sound is sometimes detected by artisans shaping it, in which case they anneal the piece before sharply bending it. Zinc, though much harder than lead or tin, is softer than ordinary brass. It dirties, or at least changes in appearance, even indoors, sooner than most common metals, and it does not keep on a coat of paint so well as any of them.

Oxide of Zinc, ZnO.—When the finely-divided metal is held in the flame of a Bunsen burner it takes fire, giving off abundance of white fumes which are zinc-oxide. These fumes were called philosopher's wool by the alchemists. On a large

scale oxide of zinc is manufactured by burning the vapour of the metal issuing from the necks of clay retorts in chambers through which an air current is passing. The vapour employed for the purpose is that produced from a retort charged with calcined ore and coke, and the oxide is deposited as a loose, white powder, forming the paint known as zinc-white. It has only about half the density of white lead and has much less 'body,' but it does not darken like the lead pigment (see WHITE PIGMENTS). This substance is also used as an ingredient in pottery colours. Oxide of zinc is readily soluble in acids, forming colourless salts. Heated in a flame it shows a yellow colour which turns white on cooling—a characteristic test for the metal. *Zinc hydroxide*, $Zn(HO)_2$, is thrown down as a bulky white precipitate from solutions of zinc salts by potash or soda, avoiding excess of alkali. It dries to a white powder.

Zinc Sulphate, $ZnSO_4,7H_2O$.—This salt, which, as shown by the formula, crystallises with seven atoms of water, used to be known as white vitriol. It crystallises in four-sided rhombic prisms isomorphous with Epsom salts, and, as sold, has usually the same appearance. It dissolves readily in water, and has a nauseous metallic taste. Sulphate of zinc is obtained when hydrogen is prepared by the action of sulphuric acid on zinc, but is made in larger quantities by roasting the native sulphide of zinc (blende) at a low red heat in the air until the necessary oxygen is absorbed. The product is thrown into water while hot, giving a solution from which the crystals are deposited. Sulphate of zinc so obtained is purified from arsenic and some other metals by treating its acidified solution with sulphuretted hydrogen. Iron and manganese have to be separated from the filtered solution by sodium hypochlorite. The salt is used in calico-printing, in making varnishes, and in medicine.

Zinc Carbonate, $ZnCO_3$, is one of the chief ores of the metal. The artificial basic carbonates are produced by precipitation from the solution of a zinc salt with an alkaline carbonate. When a boiling solution of sodium carbonate has the purified solution of zinc sulphate slowly added to it, a basic carbonate of zinc separates, which is then washed and dried. This gives the pure oxide on being heated.

Zinc Chloride, $ZnCl_2$, formerly known as *Butter of Zinc*, is formed by heating the metal in chlorine gas. But it is usually obtained by dissolving zinc or its oxide in hydrochloric acid, and evaporating the solution to dryness, fusing the residue, and casting it into cakes. When thus prepared it contains some oxychloride. It is grayish white, waxy, and extremely hygroscopic. It is very soluble in water, for which it has a great affinity, and is used as a caustic. Chloride of zinc deprives some organic bodies of water, producing decomposition. It is disinfectant and antiseptic.

ORES.—Blende and Calamine are the two principal ores of zinc. Those of minor importance are Zincite, Franklinite (q.v.), and Electric Calamine.

Blende, Sphalerite, Black Jack, or Sulphide of Zinc, contains when pure 67 per cent. of zinc and 33 of sulphur, but like most ores it usually contains impurities. It crystallises in the tetrahedron section of the cubic system. The crystals are generally of a beautiful black colour, and present considerable variety in their forms. Blende occurs in all the older geological formations sometimes associated with the ores of copper and tin, but most frequently with galena or sulphide of lead. In the United Kingdom blende is now chiefly mined in Wales, the Isle of Man, and Cumberland. It also occurs with galena at Leadhills in Scotland. On the Continent it is found plentifully in many localities, and abundantly in America with lead ore in Missouri, Wisconsin, Iowa, and Illinois. Blende is associated with other minerals in many places in Australia, but has not yet been found in large quantity.

Calamine, or Carbonate of Zinc.—By some mineralogists this mineral is called *Smithsonite*, a name more usually given to the silicate of zinc. It crystallises in the rhombohedral system, and contains when pure 52 per cent. of zinc. Calamine is generally found in calcareous rocks, and is usually of a dull yellow or reddish-brown colour in the ordinary massive state. Owing to impurities of earthy matters and oxide of iron, its percentage of zinc is sometimes as low as from 15 to 20. Calamine and blende are frequently associated. The metal obtained from the latter is generally somewhat inferior. Carbonate of zinc occurs in Belgium, in Silesia, at Santander in Spain, and elsewhere; but little is now raised in England. In the United States it is plentiful at Lancaster, Pennsylvania, and also occurs in south-west Missouri, Minnesota, Wisconsin, and in Arkansas, where in Marian county a variety is found coloured bright yellow by sulphide of cadmium, and known locally as 'turkey-fat ore.'

Electric Calamine, Silicate of Zinc.—The composition of this mineral when pure is zinc-oxide 67·5 (zinc 54), silica 25·0, water 7·5. It crystallises in the orthorhombic system, and its crystals are strongly pyro-electric. Its colour, always delicate, has many shades, such as white, blue, green, brown, yellow, red, and gray. Electric calamine is found along with other zinc or lead minerals in Carinthia, Westphalia, near Aix-la-Chapelle, and sparingly at Matlock and elsewhere in England. It is worked at one or two places in the United States, notably near Selinsgrove on the Susquehanna, and in Wythe county, Virginia. Silicate of zinc is now more easily smelted than formerly through the introduction of Siemens' gas-furnace.

Zincite, or Red Oxide of Zinc, is a mineral usually found massive with either a lamellar or a granular texture. Its crystals are hexagonal, but they are rarely found, and its colour is either red or orange. It contains about 94 per cent. of oxide of zinc and 6 of protoxide of manganese. It is found associated with Franklinite in New Jersey.

SMELTING.—The temperature at which roasted zinc ore (either carbonate or blende) is reduced is nearly the same as that which volatilises the metal, so that it requires to be smelted in closed retorts or muffles. There were formerly three kinds of closed-vessel furnaces in use for reducing the ore—the English, the Belgian, and the Silesian, but the first of these is little if at all employed. The furnace employed in the *Belgian Process* is an arched chamber, or recess, open in front. It is built of brick, and is shown in cross section in fig. 1. The retorts *a*, *a*, *a*, which fill the chamber, and into which the charge of ore

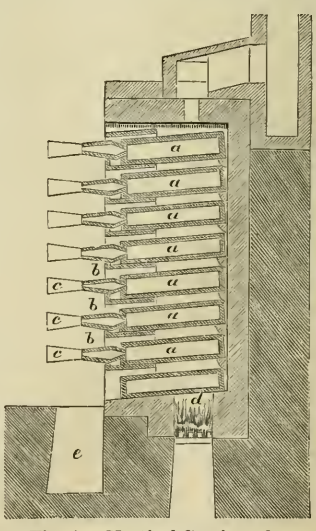

Fig. 1.—Vertical Section of a Belgian Furnace.

and coal is put, are made of fireclay, each being about 3 feet 3 inches long and from 5 to 6 inches in internal diameter. In an ordinary sized furnace, four of which are built in one stack or group, the chamber contains forty-six retorts arranged in eight parallel rows, but some have about double this number. These are supported at back and front in such a way as to allow the heat from the fire to play freely round them. Each retort has in front a bellied fireclay nozzle or adapter (*b*), on which fits a sheet-iron cone or receiver (*c*) having a small opening at the end. The fireplace (*d*) stretches across the width of the furnace under the lowest row of retorts, and the spaces between the retorts at the front are filled up with fireclay.

Each retort is charged with 13 lb. of roasted blende and an equal weight of non-caking coal, both powdered and intimately mixed. When the temperature of the furnace becomes high enough the blue flame of carbonic oxide appears at the end of the clay adapter, but by-and-by when zinc vapour begins to escape the flame becomes opaque and white in colour. As soon as this is noticed the sheet-iron cone is put on, in which zinc oxide collects. In a couple of hours, or it may be considerably longer, the bellied portion of the adapter, in which the zinc vapour condenses, contains a sufficient quantity of zinc to be removed. The oxide of zinc and zinc dust which accumulate in the iron receiver are also removed, and either added to the next charge or turned to some other use. The operation of emptying the adapter and receiver is

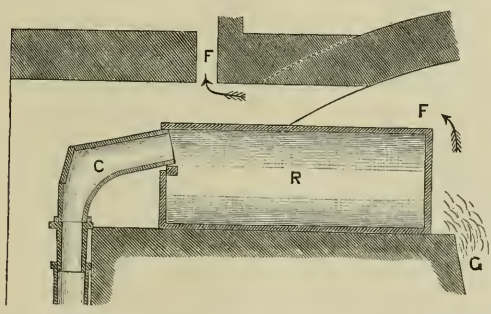

Fig. 2.—Longitudinal Section of a Retort or Muffle (R) of a Silesian Furnace: C, condensing portion; G, fireplace; F, flue, which also passes along the sides.

repeated at intervals till in about twelve hours the distillation is complete—i.e. till all the ore supplied at one time to the retorts of a single furnace is reduced. The zinc collected from the adapters is cast into oblong plates weighing fully ½ cwt., and known commercially as spelter. It is necessary before again charging the retorts to take off the adapters and scrape out the residue as well as any adhering slaggy matter, for the reception of which the pit *e* is provided.

In the *Silesian Process* larger fireclay retorts (muffles) are used than in the Belgian. They are differently arranged in the furnace, and are shaped like an oblong chest with a semicircular top (fig. 2). Each retort is internally 3 or 4 feet long, about 18 inches high, and 8 inches wide. An elbow-shaped nozzle is attached at the top of one end, and from this a pipe descends into a suitable receptacle. As the distillation goes on the zinc vapour passes over, and, when it condenses, falls into this receptacle in the form of drops of metallic zinc. Sometimes a nozzle like that for the Belgian retorts is used. The retorts, from ten to twenty or more in number, are all on one level in a low arched chamber of a rectangular shape. They are placed on two opposite sides with a fireplace between them. In preparing the charge for these retorts the amount of powdered coal or other fuel mixed with the ore varies from 25 to 50 per cent. It is greater for such zinc minerals as are difficult to reduce, or are easily fusible, than for other ores. A charge is worked off in twenty-four hours, the distillation commencing in six hours or rather more. In Silesia the calamine smelted does not contain on an average more than 15 per cent. of metallic zinc; 40 per cent. is the yield of a rich calamine carefully dressed.

The Belgian furnace takes up less room and consumes about one-fourth less fuel than the Silesian.

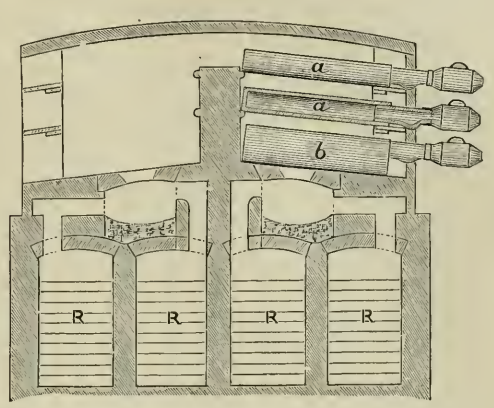

Fig. 3.—Siemens' Furnace adapted to the smelting of Zinc: *a*, *a*, Belgian retorts; *b*, Silesian retort; R, regenerators (see art. GLASS, p. 240).

On the other hand, there is greater expense for retorts in the former owing to their being more fully exposed to the heat of the fire. Fig. 3 shows a Siemens' furnace adapted to smelting zinc with both Belgian and Silesian retorts. In smelting zinc there is a loss of from 15 to 24 per cent. of the metal in the ore with English blende, and the amount of this loss is also considerable in the case of foreign ores. Zinc is obtained in an almost pure state by redistillation in clay retorts, if the first portion which comes over is rejected. But if required quite pure the oxide purified as above described under *zinc carbonate* must be reduced by pure carbon, such as charcoal from sugar.

Until it became known early in the 19th century that raising zinc to the temperature of 300° F. or somewhat less rendered it fit to be worked by machine tools the metal was used for little else than to make Brass (q.v.). It is still very largely employed to produce this and other alloys, but zinc itself is now extensively manufactured into many different kinds of objects. Among these may be mentioned sheets and other forms for roofing purposes, baths, plates for engraving upon, light screens with open patterns, and numerous kinds of stamped ornaments and articles of utility. In Paris and elsewhere it is largely used for the cheaper kinds of 'bronze' statuettes and like decorative objects, as it can be easily darkened to imitate bronze (see BRONZING). One of the most important applications of zinc is in galvanising iron to protect it from rusting, especially in such cases as roofing sheets, water vessels, and telegraph wires. Zinc has not a good reputation as a structural material other than for covering purposes.

The average annual produce of the zinc-mines of the United Kingdom during the five years ending 1899 was about 20,000 tons of ore (value £76,000), yielding nearly 7500 tons of metallic zinc, the value of which varied from £15 to £21 per ton. The

half of this total was obtained from Welsh mines, the blende of Cornwall being apparently for the present exhausted. The average yearly imports of zinc and its manufactures for the same period had a value of £1,756,000.

In the United States, where the production of zinc has of late been rapidly increasing, the yield in 1889 was 58,860 (value £1,158,365) and in 1898 115,399 short tons (value £2,077,180); and this was mostly smelted in the states of Illinois, Kansas, and Missouri. Taking the yield of all countries into account, the total amount of zinc produced has for some years been gradually decreasing.

Zincali. See GYPSIES.

Zincography. See ILLUSTRATION.

Zingel (*Aspro zingel*), a fish of the perch family, found in the Danube.

Zingerle, IGNAZ VINCENZ, poet and scholar, was born at Meran, 6th June 1825, began philosophical studies at Trent, was a short time inmate of a Benedictine monastery at Marienberg, became professor in 1848 at the Gymnasium in Innsbruck, and in 1859 of German Language and Literature at the university there. Besides his volumes of poems he published much on ethnography, and literary and historical matters. Many of his books are devoted to the Tyrol, its myths, folk-tales, family names, customs, &c. He died 10th Jan. 1881.

Zingiberaceæ, a natural order of about 470 species of perennial tropical herbs, with horizontal thickened root-stock and cone-like inflorescence, with three tribes, of which *Zingiber* (see GINGER), *Maranta* (see ARROWROOT), and *Canna* (see INDIAN SHOT) are types. The Marantaceæ were formerly treated as a separate order; and Scitamineæ included Zingiberaceæ and Musaceæ.

Zinzendorf, NICOLAUS LUDWIG, COUNT VON, the founder of the Moravian Brethren, or Herrnhuters, was born at Dresden, 26th May 1700, and died at Herrnhut, 9th May 1760. He wrote sermons, hymnals, catechisms, and a number of controversial and devotional works.

See the article MORAVIANS; also the German Lives by Spangenberg (1773–75), Schrautenbach (1851), Verbeek (1845), Varnhagen von Ense in his *Biographische Denkmale;* Tholuck in *Vermischte Schriften;* also Bovet, *Le Comte de Zinzendorf* (1860; trans. as *The Banished Count*, 1865), and Burkhardt (1876).

Zion. See JERUSALEM.

Zirconium (sym. Zr, equiv. 90) is the metallic constituent of the earth *zirconia*, which is found in association with silica in the minerals *zircon* and *hyacinth*, and is obtained only in Ceylon, one district of the Ural, and southern Norway. Berzelius obtained it in 1824 from Zirconia, which Klaproth had discovered in 1789.

Zirknitz, LAKE (Slovenic *Cirknica*), in Carniola, is 20 miles SW. of Laibach and 1860 feet above sea-level. Its area and depth depend much on the rainfall; the tunnels and cavities in the limestone mountains around either adding to it or carrying off its waters according to the weather. It is sometimes 5 miles long, with an average depth of 18 feet; but in some years its whole area is dried up. Hence the saying that according to season one may fish, hunt, or harvest in or on it.

Ziska, or ZIZKA, JOHN, the famous leader of the Hussites, was born of noble family at Trocznov, in Bohemia, about 1360. Brought up as page to King Wenceslas, he embraced the career of arms, and it was his desperate courage at the head of his Bohemian and Moravian contingent that decided the dreadful battle of Tannenberg (15th July 1410), in which the Grand-master and 40,000 Teutonic Knights were left dead on the field. Ziska next fought with the Austrians against the Turks, and distinguished himself at Agincourt (1415) against the French. Returning to Bohemia soon after the murder of John Huss (q.v.), he became chamberlain to King Wenceslas, and joined the extremest party of hatred against Rome. After the outbreak at Prague (30th July 1419) Ziska was unanimously chosen leader of the popular party, and the first great religious conflict of Germany began. Wenceslas dying, his brother, the faithless Emperor Sigismund, sent 40,000 men into the country to obtain the throne, but the Hussites defeated his army with a hastily levied force of but 4000 men. Ziska quickly completed his conquest of Bohemia by capturing the castle of Prague (1421), and secured his hold of the country by the erection of fortresses, chief of which was that of Tabor, whence his party derived its name of *Taborites.* Ziska armed his followers with small firearms then little used, and made up for his lack of cavalry by the protection of the *Wagenburg*, or 'cart-fort,' constructed of the baggage-wagons. In 1421 he lost his remaining eye at the siege of the castle of Raby, but though now totally blind he continued to lead on his troops to a succession of twelve victories almost unexampled in history. Indeed his one defeat (Kremsier in Moravia) was almost a drawn battle. The victory of 18th January 1422, when Sigismund's second invading army was driven in headlong rout into Moravia, and 2000 drowned in attempting to escape across the frozen Iglau, was his greatest battle; and next year at Aussig he overthrew the German army, commanded by Frederick the Warlike of Saxony and the Elector of Brandenburg. Sigismund, now convinced that to conquer Bohemia was impossible, offered the Hussites full religious liberty. But the war-worn old soldier did not live long enough to complete the treaty, for at the siege of Przibislav he was seized with the plague, and carried off, 12th October 1424. He was buried in a church at Czaslav, and his iron war-club was hung up over his tomb. An apocryphal but characteristic story was long told that by Ziska's express command his skin was tanned and made into a cover for a drum, that even when dead he might be a terror to his enemies. Ziska was cruel, but less so than his enemies. See HUSS; also the study by Tomek (in German, Prague, 1882).

Zither, the cithern, the modern representative of the ancient *cithara*, is a popular and common instrument in Tyrol, and of late years has become more widely known. It is a flat stringed instrument, having a wooden frame and flat sounding-board with from twenty-nine to forty-two strings. When to be used it is placed on a table or on the knees, and the strings are played by the right hand, the thumb being armed with a metallic *plectrum* to bring out the melody more prominently. Its tone is clear, keen, and melodious.

Zittau, a town of Saxony, on the Mandau, near its junction with the Neisse, is an important railway centre, 21 miles SSE. of Liban and 21 SSW. of Görlitz. The chief buildings are the church of St John and the Byzantine Rathhaus. Zittau stands in the centre of a district rich in lignite, and in its neighbourhood are a group of busy manufacturing villages. It is also the centre of the linen and damask industry of Saxony, and has manufactures of woollens, besides bleachfields, dye-works, and iron-foundries. Pop. (1890) 25,394.

Zizel, or SUSLIK (*Spermophilus citillus*), a European ground squirrel, type of a genus mainly American. See SQUIRREL, CHIPMUNK.

Zlatoust, a town of Russia, on the navigable Ai, 198 miles NE. of Ufa by the great Siberian railway (1890). It has iron-foundries, and manufactures small-arms; pop. 19,014.

Zmeinogorsk, a town of Siberia, 350 miles SW. of Tomsk. In the neighbourhood is one of the most productive silver-mines in Siberia. Pop. 6000.

Znaim, a town of Moravia, on the Thaya, 63 miles by rail N. by W. of Vienna, with earthenware manufactures. Here Marmont and Masséna defeated the rear-guard of the Archduke Charles, 11th July 1809. Pop. 12,254.

Zoæa. See CRUSTACEA.

Zoan. See TANIS.

Zoantharia. See ACTINOZOA.

Zoar, a village of Ohio, on the Tuscarawas River and Ohio Canal, 91 miles by rail S. of Cleveland, the seat of a German socialistic community. Pop. about 300.

Zöckler, OTTO, theologian, was born at Grünberg in Hesse, May 27, 1833, studied at Giessen, Erlangen, and Berlin (1851–56), became *privatdocent* at Giessen in 1857, and professor extraordinary in 1863, and obeyed a call in 1866 to Greifswald. He edited the *Evangelische Kirchenzeitung* (from 1882) and other religious serials.

Among his books are a history of asceticism (1863), *Die Evangelienkritik und das Lebensbild Christi* (1865), several sections of Lange's *Bibelwerk* (1866–72), *Das Kreuz Christi* (1875; Eng. trans. 1877), *Theologie und Naturwissenschaft* (2 vols. 1877–79), and *Gottes Zeugen im Reiche der Natur* (2 vols. 1881; Eng. trans. 1886). He edited, and partly wrote, the well-known *Handbuch der theologischen Wissenschaften in encyklopädischer Darstellung* (3 vols. 1883–84; 3d ed. 4 vols. 1889–90), and, together with Strack, a *Kurzgefasster Kommentar* to Old and New Testaments and the Apocrypha (1886 *et seq.*).

Zodiac (Gr. *zodiakos*, commonly derived from *zoon*, 'an animal'), the name given by the ancients to an imaginary band extending round the celestial sphere, having as its mesial line the ecliptic or apparent path of the sun. It was fixed at about 16° in width, for the purpose of comprehending the paths of the sun and of the five planets (Mercury, Venus, Mars, Jupiter, and Saturn) which were then known; and as of these planets Mercury has by far the greatest inclination of orbit to the ecliptic, and the value of that element in his case is only 7° 0′ 9″, the width given to the zodiac was amply sufficient for the required purpose. But when the career of planetary discovery commenced in the beginning of the 19th century the first three which were discovered (Ceres, Pallas, and Juno) at once destroyed the idea which had been long seated in men's minds, that no planets existed beyond the limits of the zodiac, by exhibiting orbits inclined to the ecliptic at no less angles than 10° 36½′, 34° 42⅔′, and 13° 3⅓′; and a large number since observed have been found to wander from 0° to 18° beyond the zodiac, from which circumstance they have, along with the three above mentioned, been denominated *ultra-zodiacal* planets. The stars in the zodiac were grouped into twelve constellations, to each of which 30° or $\frac{1}{12}$th of the whole circle was assigned, though it often did not fill up that space, but was only situated in it; and this equable division into *signs* was of great advantage in defining the positions of the sun and planets at any epoch.

The constellations, with the appropriate symbols of the corresponding signs, are as follows: Aries (*Ram*) ♈; Taurus (*Bull*) ♉; Gemini (*Twins*) ♊; Cancer (*Crab*) ♋; Leo (*Lion*) ♌; Virgo (*Virgin*) ♍; Libra (*Balance*) ♎; Scorpio (*Scorpion*) ♏; Sagittarius (*Archer*) ♐; Capricornus (*Goat*) ♑; Aquarius (*Water-bearer*) ♒; Pisces (*Fishes*) ♓. As one half of the ecliptic is to the north, and the other to the south of the equator, the line of intersection of their planes is a diameter of each, and the two points in which this line meets the celestial sphere are known as the equinoctial points. The comparative immobility, with respect to the ecliptic, of these points suggested at once the employment of one or other of them as a point from which to reckon, and accordingly that point at which the sun crosses the equinoctial from south to north was fixed upon, and called the first point (or commencement) of Aries. After the sun had advanced eastward through this sign—i.e. 30° along the ecliptic—he entered the sign of Taurus, continuing his course onward through the others in the order in which they are given above, again crossing the equinoctial southwards at the point where he emerged from Virgo and entered Libra. This was the case with the sun during the time of Hipparchus (q.v.); but though the equinoctial points move very slowly, yet they do so continuously, and the westerly motion of 50″ annually which they have along the ecliptic has at the present time separated the sign Aries from the constellation Aries, and caused the former to correspond almost to the constellation Pisces. This gradual retrogression of the signs through the constellations of the zodiac will continue till they accomplish, in about 25,868 years, a complete circuit; after which period the sign and constellation of Aries will coincide, as they did in the time of Hipparchus. Neither the zodiac nor its constellations are of much use now in astronomy, except as, like the other constellations, affording an easy though somewhat fantastic nomenclature for the stars, and a rude but sometimes convenient mode of reference to their positions.

Zodiacal Light is the name given to a singular appearance seen after sunset or before sunrise, at all seasons of the year in low latitudes, but rarely in Great Britain except in March, April, and May in the evenings, and six months later in the mornings. It is obviously due to illuminated (partly, perhaps, self-luminous) matter surrounding the sun in a very flat lenticular form, nearly coinciding with the plane of the sun's equator, and extending to a distance from the sun greater than that of the earth, since its apex is often seen more than 90° from the sun. It seems to have been first distinctly pointed out by Cassini, and was long regarded as the sun's *atmosphere*. But this idea is totally irreconcilable with mechanical principles; since to assume so flat a form, in spite of the enormous attraction of the sun, and its own elasticity, an atmosphere would have to revolve with a velocity so great as to dissipate it into space. The common explanation of the phenomenon is that it consists (like the rings of Saturn) of an immense assemblage of small cosmical masses, such as are continually encountering the earth in the form of aerolites or meteorites. For the dynamical stability of such a system it is only necessary that each fragment should separately describe its elliptic orbit about the sun. The mutual perturbations of the system, on account of the enormous mass of the sun, will be exceedingly small, except in the case of actual collision; but some of the planets will have a considerable effect upon it.

Zoega, JOHANN GEORGE, archæologist and Coptic scholar, was born in Jutland, 20th December 1755, studied at Göttingen, and finally settled at Rome, where he turned Catholic. He wrote on Egyptian coins and Roman bas-reliefs, and made a great catalogue of Coptic MSS. He died February 10, 1809. See Life by Welcker (1819).

Zoepffel, RICHARD OTTO, a theologian of the school of Ritschl, was born at Arensburg in Livonia, June 14, 1843, taught theology at Göttingen, but settled in 1872 at Strasburg, where he became ordinary professor in 1877, and died 7th January 1891. His books are *Die Papstwahlen* (1871) and *Johannes Sturm* (1887). In conjunction

with Holtzmann he edited the *Lexikon für Theologie und Kirchenwesen* (1882; 2d ed. 1888–91).

Zoetrope (Gr. *zōē*, 'life,' and *tropos*, 'a turning'), a scientific toy by which several pictures of objects or persons in various positions are combined into one visual impression, so as to give the appearance of movement or life. It consists of a hollow cylinder, closed at the lower end, supported on a vertical axis in the centre of that end. Round the interior of the cylinder, in its lower part, is a band of pictures of the same object, but varied in succession according to the varied steps of the movement intended to be shown. Round the upper part is a series of narrow slits, equal in number and opposite to the pictures. On revolving the cylinder rapidly and looking through these slits as they pass the eye, the figures of the picture appear as one moving figure. Each picture impresses the eye but for a moment, and is blended with the real picture by the continuance of the retinal sensation in the eye. Thus all become apparently successive positions of the *same* figure. The Kinetoscope and Cinematograph are developments. See EDISON; CINEMATOGRAPH.

Zoffany, JOHN, R.A. (1733–1810), a German portrait-painter settled in London.

Zoilus, a Greek rhetorician, who flourished in the 3d century B.C., and was born at Amphipolis. From the bitterness with which he attacked Homer he was surnamed *Homeromastix* ('Homer's Scourge'), and has bequeathed his name proverbially for a malignant critic.

Zola, a town on the upper Benue (q.v.), near the eastern frontier of the (British) Royal Niger Company's territories.

Zola, ÉMILE, the most celebrated, if not the best, French novelist of the last quarter of the 19th century, is not a Frenchman by extraction, his father having been an Italian engineer, who, however, executed works in France. The son was born in Paris on 2d April 1840, but passed most of his early life in Provence, returning to the capital for his school education. His father had died when he was a small boy, and when he left school he entered the publishing house of Hachette as a clerk. He became an active journalist pretty early, and engaged not merely in fiction, but in criticism both of art and literature. Here he was almost uniformly unfortunate—indeed the rather silly title, *Mes Haines*, under which his chief critical articles have been reprinted, shows his weakness; for you do not become or continue a critic by hating, but by loving. Like other journalists, he had to deal with politics, and was not much more fortunate here; while later he attempted the drama with equal lack of success. The truth is that M. Zola, for good or for ill, was a novelist born: and after early beginning his immense work in this department he by degrees confined himself to it. It is not a little noteworthy that among his earliest work figure the charming *Contes à Ninon*, collected and published when he was four-and-twenty, which have none of the faults of his later and larger works, and have sometimes been thought, not always by the least competent critics, to show him at his very best. This faculty for short stories showed itself again and again in *Nouveaux Contes à Ninon*, published ten years later (1874), in the still more recent collections, entitled from their chief tales *Le Capitaine Burle* and *Naïs Micoulin*, and most of all in the splendid *Attaque du Moulin*, the first piece of a collection of stories by himself and his chief disciples entitled *Les Soirées de Médan* (M. Zola's country house), and published in the year 1880. Long before this latter date, however, the author had become one of the most prominent and contested figures in the French literature of his day. In the later years of the empire he had formed with Flaubert, Daudet, the Goncourts, and the Russian novelist Turgenief a sort of informal society, which discussed all things literary, and which tended in the persons of its younger members to form what is called the Naturalist school—a name, of which, in contradistinction to 'Realist,' M. Zola claims the copyright. Among other works he published in 1867 a book, *Thérèse Raquin*, in which again others have seen his greatest work, and which certainly is a very powerful and remarkable picture of the effects of remorse.

But it was not until after the war that, in imitation to a certain extent of Balzac, he began the great series of novels generally called *Les Rougon-Macquart*. It is seldom that two years have passed without an addition to this series, which now contains, with branches and complements, a score or so of volumes, not proceeding in strict chronological order, but all connected by the appearance, more or less, of the same or different members of the family. This singular collection of books is, in the strictest sense, a collection of novels with a purpose—or with several purposes. It is a curious fact that the southern nations, which have originated few of the scientific or philosophical ideas of these later ages, have seized hold of them with a rather undisciplined avidity. The two 'mother-ideas' of M. Zola's *Comédie Naturaliste*, or as some would unkindly say, 'Comédie Bestiale,' have been the idea of heredity and the idea of a certain cerebral infirmity, which determines in different ways the fate of individuals. But in working this theory into practice M. Zola has imported a notable difference. It has been his intention to apply it in the widest manner to the study of the *document humain*—the records real or supposed of actual lives—and in order to do this he has taken the most extraordinary pains to master the technical details of most professions, occupations, and crafts, together with the history of recent and actual events in France. He began with a sort of general sketch and introduction called *La Fortune des Rougon*, and then he diverged into specialist paths. *La Curée* and *Son Excellence Eugène Rougon* dealt, or were supposed by the author to deal, with the society and official life of the later days of the Second Empire. *La Faute de l'Abbé Mouret* attacked the life of the country clergy and the results of celibacy, and, like *La Conquête de Plassans*, a vivid study of provincial life, has some special admirers. *Le Ventre de Paris* busied itself with the lowest, or almost the lowest, strata of the Parisian population, the life-history of the *halles* or markets—a theme which was later and somewhat differently treated in the most famous of the author's earlier works, *L'Assommoir*, a book specially depicting the vice of drunkenness; in *Pot-Bouille*, which dealt with the lower *bourgeoisie* and their servants; in *Au Bonheur des Dames*, which handled shops. *Une Page d'Amour* (much affected by some) and *La Joie de Vivre* (not successful as a whole, but very powerful in parts) were more generally and ambitiously human. *Nana*, the 'success of scandal' of the whole, was devoted exclusively to the cult of that great goddess, Lubricity, of whom we have all heard, and who certainly has her followers in France and elsewhere. *L'Œuvre*, the opening of which, at least, obtained praise from critics not very fond of him, dealt with art and literature. *La Terre* (the beastliest of the whole, unless that proud pre-eminence be allotted to *Germinal*, which dealt with mining) was conse-

erated to the French peasant. *La Bête Humaine* contains much minute information as to the working of railways; *Le Rêve* displayed a remarkable acquaintance with the details of church ritual; *L'Argent* exploited financial crashes; and *La Débâcle* grappled with the great disaster of 1870. *Dr Pascal* (1893) is 'a story of the emotions;' *Lourdes* (1894), dealing with faith-healing, can hardly be described as a novel; *Rome* (1896) is an elaborate (and critical) study of the Papal court and its surroundings; and this trilogy includes a volume entitled *Paris* (1898). *Fecondité* was a work of 1899. M. Zola has repeatedly been a candidate for a chair in the Academy.

No space at command here would suffice to criticise in detail M. Zola's books, or to set forth, except in shorthand, the objections which have been taken to them, and the replies which have been made to the objections. We must content ourselves with the 'heads' of both. The panegyrists of M. Zola say that convention had reigned long enough in literature; that it was time for an uncompromising and scientific view of human nature to take the place of superficial observation and romantic idealism; and that M. Zola has heralded and led this transformation with extraordinary vigour and skill. The adversary has urged from the beginning (and, while fully admitting the immense industry and remarkable power of the novelist, continues to urge) that his whole conception of art and nature is radically wrong. It is pointed out that M. Zola in the first place seems to confine his attention, by preference and deliberation, to sides of human nature which, though admittedly existent, are intermittent and exceptional; that where he attempts other sides, as in *Le Rêve*, he is more conventional and unreal than the most *clair-de-lune* sentimentalist; that he has no notion or grasp of human nature as a whole. It is further urged that his attempt to turn the encyclopædia into a novel, and to load his books with technical information, leads occasionally to blunders which do not very much matter, and constantly to a stiff and inartistic presentment which matters very much.

In 1897 M. Zola came conspicuously before his country and the world as a sufferer for conscience' sake. He took up with splendid courage the cause of Captain Dreyfus (q.v.), impeached the military methods, declared the trial unfair and the result a scandal, denounced anti-Semitism, and maintained the innocence of Dreyfus. M. Zola was tried and found guilty, but the verdict was annulled on technical grounds; condemned on a second trial to twelve months' imprisonment and a fine of 3000 francs, he escaped to England, but returned after the decision of the Cour de Cassation in 1899. He opposed (in vain) as unjust to the innocent the amnesty law of 1900, meant to bring to an end all the causes connected with Dreyfus.

See studies by Sherard (1893), Toudouze (Paris, 1896), and Vizetelly.

Zollikofer, Georg Joachim, a famous pulpit orator, born at St Gall in Switzerland, 5th August 1730, became preacher at Murten in 1754, at Leipzig in 1758, and died there, 25th January 1788. His sermons fill fifteen volumes (1789–1804). See the studies by Garve (1788) and Claudius (1783).

Zollverein (Ger., 'customs-union'), a union of the German states, under the leadership of Prussia, so as to enable them in their commercial relations with other countries to act as one state. When, after the war of liberation in 1815, the political union, destroyed by the downfall of 'the Holy Roman Empire,' had been restored to a certain degree in the German Confederation (see Germany, Vol. V. p. 182), internal commerce was felt to be trammelled and depressed by the collection of revenue at the frontiers of every petty state; and united action in regard to foreign commerce was impossible. The first suggestion of such a customs-union came from Prussia; but it took many years before an actual beginning was made, and still longer before it reached its ultimate extent, as the plan was opposed for a long time by the jealousies and special interests of many of the states. In 1834 eighteen states had entered a union for a term of eight years; in 1835–38 five more, in 1842–52 other five, including Baden, Brunswick, Frankfort, and Hanover. During the term 1854–65 all the German states were members except Austria, the two Mecklenburgs, and the Hanse towns. The events of the Austro-Prussian war disarranged the union. In 1867 a new customs-union was established between the North German Confederation and Bavaria, Würtemberg, Baden, and Hesse. But all such arrangements were rendered superfluous in 1871 by the constitution of the German empire.

Zomba, in the highlands of the Shiré (q.v.), seat of the Imperial Commissioner for British Central Africa. See Nyassa.

Zombor, a royal free town of Hungary, capital of the district of Bacs, near the Franzen Canal, 42 miles NE. of Essek by rail. Pop. 26,435.

Zonaras, Joannes, a historian who flourished at Constantinople in the 12th century, was private secretary to Alexius I. Comnenus, and spent the last years of his life in the monastery of St Elijah at Mount Athos. His chief work, the *Chronicon*, is a poor compilation giving the history of the world from the creation to the death of Alexius in 1118. It was edited by Wolf (1557), Du Fresne (1686), Pinder (2 vols. 1841–44), and Dindorf (6 vols. 1868–75). Zonaras wrote also on the *Syntagma* of Photius, *scholia* to the New Testament, &c.

Zoological Gardens, London, familiarly known as the 'Zoo,' a triangular piece of ground about 20 or 21 acres in extent on the north side of the Regent's Park, containing one of the finest collections of animals in the world. The ground was first rented in 1828 by the Zoological Society, which was instituted two years previously. On 1st January 1892 the society had 2985 fellows, and the gardens, which during 1890 were visited by 640,987 persons, during 1891 by 598,730, had 2232 animals—630 mammals, 1346 birds, and 256 reptiles.

Zoology, the science of animal life, included along with Botany within the science of Biology. What has been said in the article Biology (q.v.) in regard to the place which the study of organisms occupies among other departments of knowledge, and in regard to the general evolution of the science, is entirely relevant in regard to zoology and need not be repeated here.

Departments of Zoological Study: (a) *Morphological.*—When we study the forms of animal life, or analyse these into their parts—e.g. organs, tissues, and cells; or arrange similar forms in groups—e.g. species, genus, family, order, and class, we are considering morphological or statical relations, the organism's actual life being left out of account. Anatomy and histology (or minute anatomy), the results of classification or taxonomy, so much of embryology as is occupied with the description of form and structure at successive stages in life-history, and of palæontology as is concerned with the structure of extinct animals must all be included under morphological zoology.

(b) *Physiological.*—When we study the habits of an animal; or analyse its activity into the

functions of its parts—e.g. organs, tissues, and cells; or investigate the chemical changes of the living matter itself; or consider the life of the animal as one of a pair, family, or herd, or in its complex inter-relations with the associated fauna and flora, we are investigating dynamic or physiological relations. What is often popularly called 'natural history,' or, more technically, 'bionomics,' is concerned with the 'higher physiology' of animals, that is to say, with their life as intact individualities and as active parts of the complex systems of things which we call nature.

(c) *Historical.*—When we inquire into the fauna characteristic of successive geological ages and endeavour to trace the history of a class, order, or the like; or when we turn our attention to the development of individual animals, and seek to work out their life-history, we are pursuing studies technically described as palæontological and embryological respectively, but agreeing in this that they are both historical or 'genealogical.'

(d) *Ætiological.*—Finally, when we inquire into the conditions of organic change and progress, and endeavour to interpret either individual development (ontogeny) or racial history (phylogeny), our studies are ætiological. As a matter of fact these departments of zoology, though logically distinct, cannot be satisfactorily pursued apart from one another, and all the greater steps of zoological progress have been made by workers who combined the various inquiries. Of such all-round zoological work the best illustration is Charles Darwin. Ray Lankester distinguishes five branches of zoological study: (1) morphography, the work of the collector and systematist; (2) bionomics, the lore of the farmer, breeder, field-naturalist, &c.; (3) zoo-dynamics, zoo-physics, zoo-chemistry, the pursuit of the learned physician—anatomy and physiology; (4) plasmology, the study of the ultimate corpuscles of living matter; (5) philosophical zoology. This division, which introduces some unnecessary new terms, may be readily harmonised with that to which we adhere and which seems to be justified both by its logical clearness and by its correspondence with the great lines of progress in the past.

History.—The rudiments of zoology must be looked for in the ancient lore of the hunter, the fisherman, the shepherd, and the breeder, and much may also be gathered from researches into the history of words, art, and religious customs, but the science first took definite shape in the mind of Aristotle (384–322 B.C.). He seems to have known over 500 animals, and describes the structure and habits of some of these; he laid the foundations of comparative anatomy and taxonomy, and with remarkable insight discerned not a few important generalisations, such as the homology of organs. But the foundations which Aristotle so firmly laid remained for more than fifteen centuries almost unbuilt on, for Pliny (79 A.D.) was little more than an uncritical collector of current information, and Galen (200 A.D.), who dissected monkeys, was rather a human anatomist than a zoologist. It is true, however, that in various countries, and at various times onwards to the Renaissance, there were restless inquisitive spirits who were neither discouraged by the general lack of interest nor silenced by the frowns of the church. Many of these, however, were wont to cloak their zoological enthusiasm in mystical guise, and it is thus that we must interpret many of the allegorical works of mediæval times. Fact and fiction were strangely jumbled; credulity and superstition ran riot along the paths of science; and the long persistence of the *Physiologus* (see BESTIARY), with its series of fifty fanciful emblems, is typical of the prevalent mood of the dark ages.

The quickening of civilisation brought about by the Crusades, the discovery of new lands by travellers like Marco Polo and Columbus, the founding of universities and learned societies, the establishment of museums and botanic gardens, the invention of printing, the appearance of Aristotle's works in translation and dilution, and many other practical, emotional, and intellectual movements gave fresh force to science, as indeed to the whole life of man. Among the results of this scientific renaissance were the labours of the 'Encyclopædists'—such as the Englishman Edward Wotton (1492–1555), who wrote a treatise, *De Differentiis Animalium;* the Swiss Conrad Gesner (1516–65), author of a *Historia Animalium;* the Italian Aldrovandi (1522–1605); and John Johnston or Jonstonus (1603–75), a Polish Scot, the author of a dozen Latin folios on natural history. By their industry a large mass of facts was accumulated, but of too many it must be said that their intellectual appetite was greater than their powers of digestion, and the progress of science was in quantity more than in quality. About the middle of the 18th century the best aims of the 'Encyclopædists' were realised in Buffon's *Histoire Naturelle* (15 vols. 1749–67), a work which in spite of its wide range—for the author took all nature for his province—was full of acute perceptions and useful suggestions.

Instead of following further the chronological development of the science, it will be convenient to notice the great workers in the different departments, although this will necessitate a certain amount of multiple reference, some of the greatest zoologists having done equally important work along several lines.

I. *Morphological.*—In the hands of John Ray and Carl Linnæus the results of their own industry and the accumulations handed down from the Encyclopædists began to take the form of a definite taxonomy. It is an instructive study, for which there is no space here, to contrast the classification which may be inferred from Aristotle's works, and which persisted down to the time of Wotton and even afterwards, with that of Linné's *Systema Naturæ* (1st ed. 1735; 12th, 1768), in which six classes were recognised—Mammalia, Aves, Amphibia, Pisces, Insecta, and Vermes, and to follow the progress of taxonomy onwards. Lamarck drew the distinction between Vertebrates and Invertebrates with greater firmness than heretofore, and distinguished 'apathetic' animals (Infusoria, Polypi, Radiaria, Tunicata, Vermes), 'sensitive' animals (Insecta, Arachnida, Crustacea, Annelida, Cirripedia, Conchifera, and Mollusca), and 'intelligent' Vertebrata (Fishes, Reptiles, Birds, and Mammals). He was a firm believer in a *scala naturæ*, a regular series of increasing structural complexity, and though this was illusory he did much towards reducing the chaos in which he found Invertebrate animals. Cuvier, in his *Règne Animal* (1829), elaborated the idea of four great types or *embranchements*—Vertebrata, Mollusca, Articulata, and Radiata. This rapidly gave way before more careful anatomical analysis, as may be inferred from the early classifications of R. Leuckart, H. Milne-Edwards, and T. H. Huxley, which in turn were destined to be superseded as embryological and palæontological research came to the aid of anatomy, and as taxonomy began to be profoundly influenced by evolutionary conceptions. As a type of these modern or genealogical classifications we may refer to that of E. Ray Lankester, given in his article 'Zoology' in the *Encyclopædia Britannica.* See also the detailed classifications in the articles VERTEBRATA, &c. in this work.

Among those who have prosecuted the anatomical analysis of the animal body, revealing those

homologies on which a sound comparative anatomy is based, Cuvier stands foremost. Meckel, Johannes Müller, Leuckart, Gegenbaur, and Dohrn among Germans; Milne-Edwards and Lacaze-Duthiers in France; Owen, Huxley, and Ray Lankester in England may be cited as representative of comparative anatomists. The analysis of organs into tissues which Bichât worked out in his *Anatomie Générale* has been followed out in great detail by zoologists, Leydig's *Histologie des Menschen und der Thiere* (Frankfurt, 1857) being a conspicuous example. The microscopic study of organisms which had been in progress since the days of Malpighi (1628–94), Swammerdam (1637–80), Hook (1635–1702), and especially Leeuwenhoek (1632–1723), led beyond tissues to the component cells, and in 1838–39 Schwann and Schleiden formulated their *Zellenlehre*, the elaboration and correction of which has been the chief task of modern comparative histologists (see CELL, EMBRYOLOGY, PROTOPLASM). This ultimate morphological analysis which leads to the study of the living matter itself has been aided by the perfecting of the Microscope (q.v.), and by the elaboration of histological technique—fixing, staining, imbedding, and microtome section-cutting.

II. *Physiological.*—If we disregard a few pioneers and isolated observations, such as Harvey's discovery of the circulation of the blood, we may associate Albrecht von Haller (1708–77) and John Hunter (1728–93) as the founders of physiology. They began to do for the functions of organs what Cuvier did for structure. Among the many illustrious zoologists who have continued their labours Johannes Müller (1801–58) is prominent, for to his own marvellous industry and to the impulse which he gave to his pupils (including many of the most famous living zoologists of Germany) we may refer much of what we know of comparative physiology—a department which has, however, lagged behind its counterpart in comparative anatomy.

Parallel to the morphological analysis from organ to cell was the gradual deepening of physiological study. Bichât's penetration beneath the functions of organs to the properties of tissues; the physiological study of cells by Schwann, Max Schultze, and many others; the experimental work of Claude Bernard, and his appreciation of the essential similarities of function in plants and animals, lead gradually to the modern study of protoplasmic metabolism (see PROTOPLASM), and to such inquiries as those of Krukenberg on the comparative physiology of animals or those of Metschnikoff on the functions of leucocytes.

III. (a) *Embryological.*—The study of individual development is the youngest department of zoological study, for although Harvey in 1651 sought to establish the fundamental fact *ovum est primordium commune omnibus animulibus*, and the true conception that organs arose by new formation (*epigenesis*) and not from the unfolding of some invisible preformation, the efforts of his prophetic genius were in great part futile, and the doctrines of the 'preformationists' persisted. Nor did immediate progress follow even when Wolff in 1759 ably reasserted Harvey's doctrine of epigenesis, for it was not till 1817 that Pander took up embryological work virtually where Wolff had left it. In fact it is from the work of Von Baer (1792–1876) that we must date the foundation of modern embryology, of which one of the most illustrious representatives was the late F. M. Balfour (see EMBRYOLOGY).

(b) *Palæontological.*—Although Leonardo da Vinci, Palissy, and others had discerned the true nature of fossils as remains of ancient life, and Woodward (1665–1722) had begun to collect and understand some of these, we need not hesitate to call Cuvier the founder of palæontology. To the fragmentary remains of the extinct he applied with signal success the principle of the 'correlation of parts,' and he was the first to begin that welding of palæontological and anatomical facts which has yielded such important results. Among continuators of his work have been Owen and Huxley in Britain, Quenstedt and Zittel in Germany, Gaudry in France, Marsh and Cope in America.

IV. *Ætiological.*—Apart from the philosophical speculations of Greek philosophers, a few ætiological suggestions found in the works of Aristotle, the evolutionary epic of Lucretius, and analogous endeavours towards an ætiology, the first serious interpretation of organic nature is that of Buffon. Buffon (1707–88), Erasmus Darwin (1731–1802), and Lamarck (1744–1829) may be called the three old masters in ætiology, and along with these we must associate Treviranus (1776–1837), Geoffroy St Hilaire, Goethe, and Oken. But the great master of them all was Charles Darwin, fellow-workers with whom have been Alfred Russel Wallace, Herbert Spencer, Ernst Haeckel, and Thomas H. Huxley. Of recent years most of the leading zoologists have contributed to the discussion of the problems of evolution, but the most prominent contributions are those of Weismann (q.v.).

Zoophyte (Gr. *zōon*, 'an animal,' and *phyton*, 'a plant'), a term signifying animal-plant, employed by Cuvier in his earlier attempts at classification to designate numerous simple animals, sedentary in habit, often with a superficial resemblance to plants. As Cuvier used the term it was practically useless, for, like the title Radiata, in which it was afterwards incorporated, it was applied far too widely to have any precision. If now used it is restricted to hydroid colonies (see HYDROIDS). It would be more accurate if read backwards, *phytozoon*, or plant-like animal.

Zoospore. See SPORE.

Zorndorf, a Brandenburg village, 5 miles N. of Küstrin, where on 25th August 1758 Frederick the Great defeated the Russians in one of the bloodiest battles of the Seven Years' War (q.v.).

Zoroaster. Ζωροάστρης, or Ζαθραύστης (so the Greeks pronounced the name of Zarathushtra), the founder or reformer of the ancient religion of the Parsees, appears as a historical person only in the earliest portion of the Avesta, the Gâthic hymns, where the aspirations, hopes, and fears of an actual human agent are unmistakably present. His name means 'Bay-camels' (hardly 'Old-camels'), *ushtra* being a frequent termination, as in 'Fleet-camels,' Frashaoshtra. His father was Pourusaspa, 'Many-horses;' his wife was Hvogvi (i.e. of the Hvogvas); his daughter was Ponru-chista, the Discreet. His family name was Spitama. This much we may accept from the statement of documents, but as soon as we leave the last Gâtha, which was the wedding-song of his daughter, we have no reliable data. Whether he was born in Ragha, the 'Zarathushtrian' province (possibly later so called from its having become a political and ecclesiastical centre), or nearer the scene represented in the Vendîdâd (chap. i.), where countries to the east are mentioned (so more probably), or, again, whether Atropatene was his home, one thing seems certain, which is that all the persons named in the Gâthas belong beside him. Notwithstanding Yasna, xlvi. 1, with its 'to what land (district) shall I turn?' which probably gave rise to the erroneous opinion, he was no immigrant or emigrant going prophetically from country to country; for such a career at such an age would have been soon cut short by his execution. He is thoroughly at home and among his relatives in the Gâthas. As the centre of a group of chieftains, one of whom was the king Vîshtâspa ('Horse-owner'?), he was carrying on with varying success a political, military, and theological struggle for the defence or wider establishment of a holy agricultural state, whose laws and principles encouraged pastoral labour, tillage, and thrift, as against the freebooting tendencies of Turanian and Vedic aggressors. In the course of his career he composed religious-political hymns, the Gâthas, of which we have now only fragments surviving in metres which appear (or reappear) in the Rik and in other parts of the Veda. (See under ZEND also for the period in which he lived, which is even more uncertain than that of Homer, but which cannot be placed later than 800 B.C., and may be greatly earlier.)

See PARSEES; Marion Crawford's novel, *Zoroaster;* and Prof. A. V. W. Jackson's *Zoroaster the Prophet of Iran* (1899).

Zosimus, a Greek historian, who held office at Constantinople under the Emperor Theodosius II. (408–450). His *Historia Nova*, a compilation mainly from earlier writers, is in six books; the first sketches the history of the Roman emperors from Augustus to 305 A.D., the other five deal more minutely with the period ending at 410. His style is concise, clear, and interesting. He seeks to unfold the causes of the decline of the empire, and, being himself a pagan, he adduces as the chief the neglect of paganism. The best editions are by Bekker (1837) and Mendelssohn (1887). —For Pope Zosimus (417–418), see PELAGIUS.

Zouaves, a body of troops in the French army, which derives its name from the Zwawa, a tribe of Kabyles in the Algerian province of Constantine. These Kabyles had long been employed as mercenaries by the deys of Algiers; and after the conquest in 1830 the French took them into their service. At first companies were formed consisting of French and Kabyles in certain proportions, officers,

subalterns, and soldiers being selected from either race; but as it was soon found that the system of commingling the two races did not promote the comradeship intended, the French and Kabyles were formed into separate companies. Their first colonel was Lamoricière, under whom and his successor, Cavaignac, they distinguished themselves in many a bloody conflict with the Arabs of the south. Gradually however the native element was eliminated, and since 1840 the Zouaves may be considered as French troops in a quasi-Moorish dress. They now amount to upwards of 10,000 men, divided into four regiments of four battalions each. They are recruited from veterans of the ordinary infantry regiments who are distinguished for their fine physique and tried courage.

When the French and the African elements of the original Zouave battalions were separated, the Africans were constituted into a separate body, under the name of Algerian Tirailleurs, a force still recruited in Algiers to form a part (also four regiments) of the regular French army. They are usually spoken of as *Turcos*, and became too well known in the Franco-German war. In 1860 a corps of French soldiers was organised at Rome as Papal or Pontifical Zouaves, under Lamoricière, who were disbanded in 1871.

Zoutspansberg, a ridge of mountains (3000–4000 feet) in the north-east of the Transvaal, which is a continuation of the *Drakenberge* (q.v.).

Zschokke, JOHANN HEINRICH DANIEL, an eminent German writer, was born at Magdeburg, March 22, 1771. He ran away from school, was some time a strolling playwright, then a student at Frankfort, afterwards lectured there and adapted plays, set out on travels and finally opened a boarding-school at Reichenau in the Grisons. In 1798 he published his *Geschichte des Freistaats der drei Bünde in Rhätien*, then removed to Aarau, where he was employed as a commissioner to settle the affairs of Unterwalden, Uri, Schwyz, and Zug; later he was a member of the Great Council of Aargau. He died at Aarau, June 27, 1848. His books include histories of Bavaria and of Switzerland, and a long series of tales, among them *Der Creole*, *Alamontade*, *Jonathan Frock*, *Clementine*, *Oswald*, and *Meister Jordan*. The most popular of all his writings was the *Stunden der Andacht* (1809–16), translated as *Hours of Meditation and Reflection* (1843). This was a Sunday periodical, supplying a complete exposition of modern rationalism, with an eloquence and zeal for sound morality worthy of the best days of orthodoxy.

Zschokke's collected writings fill 35 vols. (1851–54). A few of his tales (*Goldmaker's Village*, *Lover's Stratagem*, *Veronica*, &c.) have been translated into English. See his *Selbstschau*, a kind of autobiography (1842; Eng. trans. 1847); also Lives by Emil Zschokke (3d ed. 1876) and Born (1886), and Keller's *Beiträge zur Politischen Thätigkeit H. Zschokkes 1798–1801* (Aarau, 1887).

Zschopau, a town of Saxony, 15 miles SE. of Chemnitz by rail. Pop. 7869.

Zuccaro, TADDEO (1529–66), painter, has left a number of pretentious but not valuable frescoes at Rome, and a few easel-pieces of no especial merit.—His younger brother, FEDERIGO (1543–1609), had some merit as a painter of portraits and other works in oil (he painted Queen Elizabeth, Mary Queen of Scots, &c. during a temporary exile), but gave most of his time to tasteless frescoes—he disfigured Florence cathedral with some 300 figures nearly 50 feet high and extravagant in attitude, which time, however, has mercifully done much to hide. Zuccaro decorated the Escorial for Philip II. of Spain, and founded at Rome in 1595 the Academy of St Luke, which suggested to Reynolds the idea of the Royal Academy.

Zug, the smallest of the Swiss cantons, has an area of 92 sq. m. and a pop. (1898) of 23,245. The south-eastern part borders on the Alpine region, and is hilly and pastoral; the north-western part, enclosing a great part of the Lake of Zug, is a rich and beautiful country of cornfields and orchards. The inhabitants speak German, and are Catholics. —Zug, the picturesque mediæval capital, situated at the north-east end of the lake, 24¼ miles off Zurich by rail, has a pop. (1888) of 5160. Many persons were killed here in July 1887 by the fall of about thirty houses into the lake.

Zuider Zee, a large gulf penetrating deep into the Netherlands, between 52° 26′ and 53° 20′ N. lat., about 60 miles in length, and 210 miles in circumference. The islands Texel, Vlieland, Ter Schelling, Ameland, and Schiermonnikoog, reaching in a chain from the most northern point of Holland, are the remains of the former line of coast, which form a breakwater against the North Sea. From Dunkirk in French Flanders to the north of Holland the interior is defended from the sea by sandhills or dunes. Here, as at the mouth of the Scheldt, the sand-barrier was broken, and in 1282 the waters overflowing the low lands separated the province of Friesland from the peninsula of North Holland, and, having united with the small inner lake Flevo, formed the present Zuider Zee. In it lie the islands Wieringen, Urk, Schokland, and Marken, with a pop. of about 5000. From the south-west of the Zuider Zee a long narrow arm, called the Y (pronounced *I*), formerly ran nearly due west through the peninsula of Holland. A strong sea-dyke and locks have been constructed to cut off the Zuider Zee from the Y, through which a broad ship-canal (see CANAL, fig. 5) has been made between Amsterdam and the North Sea. On both sides of the new canal the Y has been drained and turned into about 12,000 acres of rich land. The new waterway was formally opened by the king in 1876. A drainage scheme, which a state commission (1892–94) recommended, proposes to reclaim, in 31 years, 450,000 acres at an estimated cost (with compensation to fishermen) of £31,000,000. See HOLLAND; and Havard, *Dead Cities of the Zuyder Zee* (trans. 1876).

Zulus (*Amazulus*), a branch of the great Bantu (q.v.) division of the human family, among whose sections the aggregate of tribes or clans now generally known as the Zulus are conspicuous for their physical and intellectual development. By nature the men are brave and are given to field sports, and, where opportunity offers, to border forays and intertribal strife. A noticeable feature in their nature is that when a fight is definitely over (bitterly and bravely as it usually is fought) no passions appear to remain, nor are feelings of revenge harboured against each other. The Zulu polity is that of a pure democracy, the chiefs being elected, and holding office during the pleasure of the people. This pleasure is given expression to through parents to subheads of districts, through them to the heads of larger districts, and through these in turn to the chief direct. Legislation occurs in the same way, through an expression of feeling from the body of the people to the chief through the heads of districts. A very complete, though unwritten, code of law, civil and criminal, exists and is well known to every adult Zulu. Polygamy is practised throughout the country, and has been from time immemorial; the marriage-tie, however, with the tenth or twentieth wife is as sacred as where monogamy prevails. As a race the Zulus are conspicuous for their morality and freedom from drunkenness and crime. Missionary efforts to

Christianise have been more tolerated and acquiesced in than successful. The pursuits of the people are pastoral. Trading is little known, and the arts are limited to the primitive needs of simple iron-work, pottery, and ornaments of copper, ivory, horn, or wood.

In the beginning of the 19th century the Zulus proper were a small clan who, responding to the ambition of the warlike chieftain Tshaka, became embroiled with most of the neighbouring tribes, with the result that one hundred or more clans, once considered as strong as the Zulu clan, were attacked in detail and compelled to acknowledge fealty to the Zulu clan proper. Tshaka during the first quarter of the century dominated South Africa practically from the Zambesi to the Cape Colony, and this as conclusively and successfully and by much the same methods as Napoleon dominated Europe for the time. Subsequent to this date the Zulus became restricted in this dominion by the advent of pioneer Europeans in the Cape Colony and the Dutch republics and Natal. Tshaka was succeeded in 1828 by his brother Dingaan, who was assassinated for political reasons. He in turn was succeeded by Umpanda, who reigned over a third of a century, dying in 1873. He left as his successor Cetewayo, who reigned from 1874 until 1878 as paramount chief over a Zululand which included not only the Zululand of to-day, but a large portion of what is now within the borders of the Transvaal and Amatongaland. In 1878 Sir Bartle Frere, the then High Commissioner for South Africa, assumed the policy that British interests in the territories bordering on Zululand were threatened by the existence of the independent nation occupying that country. Acting on this policy, he, in opposition to the views held by Sir Henry Bulwer and other officers of the crown in South Africa, sent on the 11th December 1878 an ultimatum to Cetewayo, which was of a nature to create war between the Zulus and the British. War being declared, active steps were taken to invade and subjugate Zululand. General the Hon. F. A. Thesiger (Lord Chelmsford) was detailed to conduct the military operations. Five columns were thrown into the country, but owing to mismanagement they all proved unsuccessful, the main one being almost annihilated by the Zulus at Isandula (q.v.) on January 22, 1879. The gloom of this fearful disaster was slightly relieved by the heroic and historic defence of Rorke's Drift (q.v.). The other columns, after a series of small battles, in which any measure of success was to a large extent attained by the colonial volunteers attached to them, recoiled on their bases, and were either shut up at Etshowe or ordered back to the British side of the Tugela River. Reinforcements were hurried forward from England, and the command of the military operations was handed to General Sir Garnet Wolseley. He arrived in Natal with the latter portion of the reinforcements; but Lord Chelmsford meanwhile had on the 4th July won a decisive battle at Ulundi. The result of the engagement was that the Zulus admitted themselves beaten, gave up the contest, and claimed the position of conquered and the protection of the conquerors. England, however, was opposed at the moment to the policy of annexation, and declined to take over the country despite the wish of the subjugated people. The home authorities appointed thirteen chiefs to reign where only one had previously ruled, with the result that anarchy and internecine strife ensued. In 1884, in which year Cetewayo died, England was again asked to exercise sovereign rights in the country, and so pacify it. This the government declined to do, and a party of Boer adventurers from the Transvaal entered the country and took sides with the combatants, succeeding ultimately in obtaining for the Transvaal the best portion of Zululand. The remainder was annexed to England in 1887 as British Zululand, but in 1898 was made an integral part of Natal, and has now representatives in both the Legislative Council and Assembly. In the Boer war of 1899–1901 several incursions were made into Zululand by the Boers, but the natives remained loyal amidst all attempts to rouse them against Britain.

See Thomas B. Jenkinson, *Amazulu* (1882); Lady F. Dixie, *In the Land of Misfortune* (1882); Frances E. Colenso, *Ruin of Zululand* (2 vols. 1884–85); Rev. Josiah Tyler, *Forty Years among the Zulus* (1892).

Zumala-Carreguy, TOMAS, the greatest of the generals of Don Carlos during the civil war of 1833–40, was born in 1789 at Ormaiztegua, in the Biscayan province of Guipuzcoa. He left his studies at Pampeluna to fight under Mina against Napoleon, and afterwards served under Quesada in the 'Army of the Faith;' and on the re-establishment of absolutism he was raised to the rank of colonel, and appointed governor of Ferrol. For his leaning to the party of the Carlists he was tried by court-martial but acquitted; in 1832 with other Carlists he was dismissed the army. But in 1833 the rising of the Basque population called him to head the Carlist insurrection. His motley army was without uniform, ill-fed, and ill-paid, yet the vigour and personality of 'el Tio Tomas' were such that he was able to maintain effective discipline. He kept his opponents at bay, defeated Rodil in the valley of Amescoas, routed another force of Christinos at Viana, gained a second victory in the Amescoas valley, completely defeating Valdez, after a battle of four days, and routed Iriarte near Guernica. These brilliant successes turned the weak head of Don Carlos, and led him to interfere with the plans of his daring and devoted general, who was anxious to strike for Madrid when the Christinos were paralysed with terror. Zumala-Carreguy was ordered to lay siege to Bilbao, but was mortally wounded by a musket-ball, and died ten days later, June 15, 1835. See CARLISTS; Henningsen's *Twelve Months' Campaign* (1836), and the *Cornhill Magazine* for January 1871.

Zumbo. See ZAMBESI.

Zumpt, KARL, philologist, was born at Berlin, 20th March 1792, studied at Heidelberg and Berlin, and after holding posts in various higher schools became in 1827 extra-ordinary, in 1836 ordinary professor at the university, and died 25th June 1849. His best-known work is the *Lateinische Grammatik* (1818; 13th ed. by A. W. Zumpt, 1874); also his editions of Curtius (1826 and 1849), Quintilian (1831), Cicero's *Verrine Orations* (1830; and Commentary, 1831), and *De Officiis* (1837).

He wrote books on the Roman knights (1839), the numbers of the population in ancient states (1841), the philosophical schools of Athens (1843), the Roman dwelling-houses (1844), Roman Religion (1845), and the legal standing of the Roman citizen (1846).

His nephew, AUGUST ZUMPT, also a distinguished philologist, was born at Königsberg, 4th December 1815, studied at Berlin, lectured in gymnasia there, and died 22d April 1877. He devoted himself especially to Latin epigraphy, and by his studies therein threw great light upon Roman antiquities. See the Life by Padoletti (1878).

Zungaria (Dzungaria, Tsungaria, or Simgaria), the country of the Zungars, a people belonging to the Kalmuck or western Mongolian stock, a race no longer existing as a separate people. Lying between the central Tian-shan highlands of the Russo-Chinese frontier and the western Altai, it is a high mountain region, in which are the sources of the Black Irtish and the Ili. The Chinese have lately

recovered their hold in Zungaria, including Kulja (q.v.). The population includes Dungans or Tungans, Chinese, Kalmucks, and Kirghiz.

Zurbaran, Francisco (1598–1662), Spanish painter, was born the son of a labourer in Estremadura, who perceived his talent and got him into a studio at Sevilie. There he spent most of his life, studious and laborious; his subjects are mostly of a religious nature, and he had a wonderful skill in such white draperies as those of the Carthusian monks. His masterpiece, an altarpiece with many noble figures, is in the museum at Seville, and in St Paul's Church there a famous Crucifixion is preserved. The London National Gallery has a fine kneeling Franciscan holding a skull.

Zurich (Ger. *Zürich*), a northern canton of Switzerland, drained by the Rhine and its tributaries, and traversed from NW. to SE. by ridges of lofty hills, between which lie three valleys, forming almost its whole surface—those of the Toss, the Glatt, and the Limmat. The last drains the beautiful Lake of Zurich, which, lying 1341 feet above sea-level, is 25 miles long, and 2½ miles broad at the widest. Zurich has not a fertile soil, but it is carefully cultivated. Zurich was one of the earliest seats of the cotton manufacture in Europe, and the spinning and weaving of cotton are still prosecuted with great success. The silk industry is nearly as important; and machinery, bells, type, paper, &c. are also manufactured. Area, 666 sq. m. Pop., German-speaking and Protestant, (1870) 284,786; (1897) 392,945.

Zurich, the capital, 41 miles by rail NNE. of Lucerne and 43 NW. of Glarus, is situated at the point where the Limmat issues from the Lake of Zurich and unites with its tributary the Sihl. It is one of the most prosperous manufacturing and commercial towns of Switzerland; yet the narrow streets and lofty houses of its older quarters, on the high ground east of the river, give it the quaint appearance of a mediæval city. Of the Romanesque cathedral, erected in the 11th and 13th centuries, Zwingli was pastor, as Lavater was of the Peterskirche. The Polytechnic (1864) houses the university, which, founded in 1832, has nearly 100 teachers and more than 500 students; and one may also notice the town-hall (1699), the botanic gardens, the six bridges, and the town library with over 100,000 volumes and 3000 MSS. Fuseli was a native. Pop. (1870) 56,695; (1888) 90,008; (1900) 165,689, in commune—in town proper, 50,000.

Zutphen, a town in the Dutch province of Guelderland, on the Yssel, here joined by the Berkel, 18 miles NNE. of Arnhem by rail. Of buildings the chief are the Great Church (1103; restored 1857) and the 'Wijn Huis' tower. At Rysselt, 3 miles N., is the boys' reformatory of 'Nederlandsch Metray' (1851). Zutphen has manufactures of paper, oil, leather, &c. It has been several times besieged; and in a skirmish on the field of Warnsfeld, a little to the east, Sir Philip Sidney (q.v.) received his death-wound from a Spanish bullet, 2d October 1586. Pop. 17,004.

Zuyder Zee. See Zuider Zee.

Zvenigorodka, a Russian town 100 miles S. of Kieff; pop. 11,350.

Zvornik, a fortified town of Bosnia, which the Austrians occupied in 1878 only after severe fighting, situated on the left bank of the Drina, about 60 miles NE. of Bosna-Serai. Pop. 3030.

Zweibrücken (Fr. *Deux-ponts*), an ancient county, from 1410 a duchy, now incorporated in the Bavarian Palatinate. Its old capital, Zweibrücken (Lat. *Bipontinum*), 45 miles by rail W. of Landau, has a large castle (now a court-house), many busy manufactories, and is notable for its Bipontine edition of the classics, beautifully printed at the ducal press from 1779. Pop. 10,534.

Zwickau, a picturesque city of Saxony, irregularly built in its older portions, in a pleasant valley on the left bank of the Mulde, 82 miles by rail SW. of Dresden. Of its churches the most noteworthy is the Gothic Marienkirche, which dates from 1451, was restored in 1839–42, and has a tower 285 feet high. The old castle has been converted into a prison. The town carries on many manufactures; but the chief source of its wealth is the rich beds of coal in the surrounding district, which employ 8000 miners. Pop. (1890) 43,941.—For the Prophets of Zwickau, see Anabaptists.

Zwingli, Huldreich (Latinised *Ulricus Zuinglius*), the Swiss Reformer, was born at Wildhaus, at the head of the Toggenburg valley, canton of St Gall, January 1, 1484. He made his studies in philosophy and humanity at Bern and Vienna, in theology at Basel under Thomas Wyttenbach, and was appointed pastor at Glarus in 1506. Here he devoted himself to study and taught himself Greek, learning by heart the epistles of St Paul. At that time the Swiss hired out their soldiers to foreign states, and Zwingli twice (1512 and 1515) accompanied the men of Glarus as field-chaplain. In 1516 he was transferred to Einsiedeln, then as now a great resort of pilgrims to the shrine of the Black Virgin. Zwingli made no secret of his contempt for the superstition of such pilgrimages, and all the papal promises of promotion failed to purchase his silence. In December 1518 he was elected to be preacher in the minster at Zurich, and one of his first duties was to rouse the council not to admit within the city gates Bernhardin Samson, who had been selling indulgences throughout the Forest Cantons. He now began to preach plain gospel truth with greater boldness than ever, and his influence grew rapidly. In 1521 he succeeded in keeping Zurich from joining the other cantons in their alliance with France—'it is no sin to eat flesh on a fast-day,' said the fearless patriot-preacher, 'but it is a great sin to sell human flesh for the slaughter.' The Bishop of Constance now sent his vicar-general to Zurich, but he was quickly silenced in debate by the Reformer (January 29, 1523), in presence of the council and six hundred men. His utter discomfiture was followed by the formal adoption by the city of the Reformed doctrines as set forth in Zwingli's sixty-seven theses. A second disputation followed in presence of nine hundred (October 26–29, 1523), with the result that images and the mass were swept away. Zwingli married Anna Meyer (*née* Reinhard), a widow of forty-three, in 1524; on Easter 1525 he dispensed the sacrament in both kinds to his congregation. Meantime the movement spread widely over Switzerland. Bern followed in 1528 after the triumphant disputation in January, then Basel, St Gall, Schaffhausen. The Anabaptists troubled the Swiss reformation (1523–26), while the great controversy with Luther, which was to rend the Protestant church, began and grew to its height. Zwingli first made public his views on the Lord's Supper (q.v.) in his famous letter to Matthäus Alber (November 16, 1524), and the first stage of the controversy closed with the fruitless conference at Marburg, brought about by Philip the Magnanimous, in October 1529. On the one side were Luther, Jonas, Melanchthon, Osiander, Stephanus Agricola, and Brenz; on the other, Zwingli, Œcolampadius, Bucer, and Hedio. Luther insisted upon identity in doctrine being necessary amongst brethren, and his refusal to give the right hand of fellowship to Zwingli made

the latter burst into tears. Of the fifteen articles prepared by Luther, there was absolute agreement on the first fourteen, and even two-thirds of the fifteenth. In his view of this last question Zwingli rejects every form of local or corporeal presence, whether by transubstantiation, impanation, or consubstantiation. He assails every form, however subtle, of the old *Capernaitic* (John, vi. 51–53, 59) conception of a carnal presence and carnal appropriation. He took his stand upon John, vi. 63, 'The flesh profiteth nothing;' but Luther wrote with chalk on the table before him, 'This is my body,' as the truth of God which nothing could explain away.

Meantime the progress of the Reformation had only aroused bitter hatred in the Forest Cantons, which foresaw the end of the traditional political importance they enjoyed in the diet. Zwingli divined that the political and religious questions could not be separated, but failed to bring the Protestant cantons to see the real nature of the crisis. Five Roman Catholic cantons formed in November 1528 a separate alliance, to which the Archduke Ferdinand of Austria was admitted a few months later. Zurich declared war in 1529 on account of the burning alive of a Protestant pastor seized on neutral territory, but bloodshed was averted for a time by the first treaty of Cappel, June 25, 1529. The Zurichers' fears were lulled into a fancied security, and Bern's jealousy of Zurich hindered co-operation, while the Forest Cantons and Zug stealthily made their preparations. At length they made a sudden dash on Zurich with a force of 8000 men, and were met at Cappel by an ill-prepared and ill-provided force of but 2000 men. The men of Zurich made a desperate resistance, but were completely defeated, and among the dead lay the great Reformer, Oct. 11, 1531. 'They may kill the body but not the soul' were his last words.

Zwingli's religious convictions came to him independently of Luther, for he was preaching substantially the Reformed doctrines as early as 1516, the year before the appearance of Luther's theses. He never had the inward struggle of Luther and Calvin, for he started from a different point from them, finding his way by degrees from Humanism to positive truth as the meaning of Scripture deepened in his mind. The inward sphere of the self-consciousness as renewed by God, in which man knows himself to be a child of God, was the region in which Luther's religious speculation lingered; Zwingli, on the other hand, emphasised the necessity laid upon man to carry out God's glory on earth by fulfilment of His will. Hence his patriotism, which sprang naturally from this religious root, and his un-Luther-like zeal for reform in the formal worship and constitution of the church, and his repudiation of everything not expressly enjoined in Scripture. Original sin he regarded as a moral disease (*morbus*), or natural defect, rather than as punishable sin (*peccatum*) or guilt. The latter term was limited to actual personal violation of God's law, but was not applicable to the natural depravity of man, itself the source of such violation. He was the first to maintain the salvation of unbaptised infants, and he believed, moreover, in the salvation of such virtuous heathens as Socrates, Plato, Pindar, Numa, Scipio, and Seneca. With regard to the universal fore-ordination and efficacious providence of God, and in regard to reprobation and election, Zwingli was as Calvinistic as Calvin or Augustine himself. As a man he was calm, intrepid, incorruptible, without the fire and genius of Luther, but with a sounder understanding and better balance of faculties. The most open-minded and liberal amongst the Reformers, he grasped the conception of a broad Christian union, beyond unessential differences in doctrine and ritual, to which it can hardly be said the Christian church has yet attained. He had no faculty for metaphysical speculation, and his four dogmatic works are terse and clear beyond most writings of their class: the Sixty-seven Articles of Zurich (1523), the Ten Theses of Bern (1528), the Confession of Faith to the German Emperor Charles V. (1530), and the Exposition of the Christian Faith to King Francis I. of France (1531)—his 'swan-song,' as Bullinger calls it, written but three months before his death.

Zwingli's *Opera* fill four folio volumes, ed. by Gualther, his son-in-law (1545). Later editions are by M. Schuler and J. Schulthess (8 vols. 1828–42; supp. 1861). A good selection in German is that by Christoffel in 11 small volumes (1843–46). The chief is the *Commentarius de vera et falsa religione* (1525); the rest are mainly occupied with the exposition of Scripture and the controversies with the Papists, the 'Catabaptists,' and on the Eucharist. There are Lives by Oswald Myconius (1532; reprinted by Neander in *Vitæ quatuor Reform.* 1841), Heinrich Bullinger (ed. by Hottinger and Vögeli, 3 vols. 1838), J. M. Schuler (1819), Sal. Hess (1819), J. J. Hottinger (1841; Eng. trans. 1856), R. Christoffel (1857; Eng. trans. 1858), J. C. Mörikoffer (1867–69), G. A. Hoff (1882), and Usteri (1883). For his theology, see the books by Zeller (1853), Sigwart (1855), H. Sporri (1866), Marthaler (1873), A. Baur (1885–89); Dorner's *Hist. of Prot. Theology* (Eng. trans. 2 vols. 1871), Principal Cunningham's *Reformers and the Theology of the Reformation* (1862); and for the great Eucharist controversy, A. Ebrard, *Das Dogma vom heil. Abendmahl und seine Geschichte* (1846).

Zwittau, a town in the extreme north of Moravia, 40 miles N. of Brunn by rail. Pop. 6351.

Zwolle, capital of the Dutch province of Overyssel, on the Zwarte Water, at the junction of several railways, 50 miles E. by N. of Amsterdam. Besides a busy transit trade it has foundries, shipyards, &c. Close by is Agnetenberg, in whose monastery Thomas à Kempis lived and died. Pop. (1898) 30,680.

Zygophyllaceæ, a natural order containing about a hundred species of herbaceous plants, shrubs, and trees, chiefly natives of subtropical countries. The most important genus is Guaiacum (q.v.). The abundance of species of Zygophyllum and some other genera constitutes a most striking feature of North African and Arabian deserts. The flowers of *Z. fabago* are employed as a substitute for capers, under the name of *Bean-capers.*

Zymose. See FERMENTATION.

Zymotic (Gr. *zymē*, 'leaven;' *zymosis*, 'fermentation'), a term for diseases caused by the multiplication of a living Germ (q.v.) introduced from without into the body. See DISEASES.

Zyrianovsk, a mining town in a rich silver-producing district of Semipalatinsk, near the southern frontier of Siberia, lies among the slopes of the Altai Mountains, on a head-stream of the Irtish; pop. 4500. The Zyrians of the neighbourhood, a tribe of the Altai Tartars, are Shamanists, and live by hunting in the forests.
